The CHAIRMAN said: Gentlemen, the gross revenue for the year ended Dec. 31, 1899, amounted to £77,008, against £65,552 for the year 1898, or an increase in the year under review of £11,486. On analysing the receipts we find the principal increase is due to the exceptional traffic with South Africa in consequence of the war in the Transvaal and the Orange River Colony. The increase under this head is £11,498, and there is also an increase of £132, being interest received for money placed on deposit, thereby making a total of £11,630. On the other hand there is an increase in the rent of cables of £563, but there is also a reduction in the loss on exchange of £419, the result being, as already stated, an increase in the gross revenue of £11,486. The total working expenses for the year 1899 amounted to £20,298 as against £21,527 for the year 1898, or a decrease of £1,229. In making comparisons we find that the principal decreases occur in Abstract B, £1,046; foreign agencies also show a decrease of £188, making together £1,234. The expenses attending repairs and renewals of cables amounted to £11,482 in 1899 against £17,718 in 1898, or a decrease of £6,236. I may mention, however, that since the date of these accounts we have had to incur the cost of expensive repairs to the Bathurst-Conakry, Bathurst-Dakar, and St. Thomé-Loanda cables. After providing for debenture interest and sinking fund, the net result of the year's working is to show a profit of £23,298, of which the Directors propose to place £23,000 to the reserve fund, and to carry the balance of £298 forward to the next year. You will notice, however, that the revenue includes £12,000 in respect of the subsidy due from the French Government for 1899, and that the non-payment of this sum has been provided for by transferring a like amount from the general fund to a special fund pending a settlement. The delay in the settlement of this item is no doubt due to the unsettled state of politics in France and consequent frequent change of ministers, but we are not without hopes that before very long we shall see an equitable arrangement arrived at. In 1896 the general reserve fund amounted to £58,000, but owing to the transfers to a special fund which your Directors considered it prudent to make in order to provide against the outstanding subsidy which has been withheld by the French Government, the general reserve fund now stands at £28,881, which, taking all these circumstances into account, must be considered quite inadequate to the requirements of the Company. The question of dividend must therefore, I think, be deferred till we are in a position to replace the heavy withdrawals out of the fund which, as I have already explained, we have been obliged to make. I beg to move the adoption of the report and accounts.

Sir HENRY C. MANCE, C.I.E., seconded, and the motion was carried unanimously.

The CHAIRMAN then explained a resolution (afterwards carried unanimously) on the subject of the staff of the West African Telegraph Co. participating in a scheme of pension and superannuation already established by the other members of the associated telegraph companies.

The Hon. Arthur Brodrick was then re-elected a Director, and Messrs. Deloitte, Dever, Griffiths & Co., were re-appointed as auditors.

A vote of thanks to the Chairman and Directors terminated the proceedings.

Electric Construction Co. (Ltd.).

The report of the directors states that the profit for the year ended May 31, including £1,441. 6s. 2d. brought forward, was £21,729. 1s. 9d., which the directors recommend should be appropriated in providing a dividend of 7 per cent. on the preference shares (£3,500) and a dividend of 6 per cent. on the ordinary shares (one-half to be paid on 31st inst., and one-half on Jan. 31, 1901), amounting to £13,452. The surplus of £4,777. 1s. 9d. is to be carried forward. The buildings and plant have been thoroughly maintained, and the usual sum (£5,000) has been credited to depreciation account, which now amounts to £33,000. The buildings of the extensions, referred to in last year's report, have been finished, and the shops are now being equipped with the latest labour-saving tools and appliances, capable of turning out economically and with despatch the largest electrical machinery that may be required.

Among the more important works of last year were the power house and line equipment, with British machinery and appliances throughout, of the extensions of the City & South London Electric Railway. The works are well supplied with orders at remunerative prices; the relations with all classes of employés are thoroughly harmonious, and the directors have awarded the usual bonus in recognition of good service.

The mortgage on the Madras Electric Tramway has been foreclosed, and the undertaking has been acquired, but it is not intended that this should be a permanent investment. Meanwhile the working of the tramway yields a moderate return on the cost, and the traffic is developing satisfactorily.

The compensation paid under the Workmen's Compensation (1897) Act is, for the year, less than £20, but £150 of last year's profit has been redited to the fund to meet such claims.

Edmundson's Electricity Corporation (Ltd.).

The directors' report for the year to March 31 states that, including £2,572. 5s. brought forward, the net profit, after payment of debenture interest, amounts to £19,832. 6s. 9d. The directors recommend that £5,000 be written off goodwill, and that a dividend of 6 per cent. be paid upon the ordinary and deferred shares (absorbing £10,674. 4s. 2d.), leaving £4,152. 2s. 7d. to be carrid forward.

The electric lighting stations at Folkestone, Winchester, Woolwich, Bromley (Kent), High Wycombe, Salisbury, Ventnor, Chislehurst, and Newmarket, all of which were completed a year ago, have been working satisfactorily, and dividends have been paid to the shareholders of the five first-mentioned companies as the result of the first year's working. These results, obtained at so early a stage, must be looked upon as most encouraging, and confirm the belief of the directors that electric lighting in such towns will prove a profitable investment.

During the year the stations at Guernsey and Alderley Edge have been completed and are now working.

Work has been commenced on stations at Montrose, Brechin, Melton Mowbray, Lymington, Sandown, Shanklin, Newport, and Cowes, and Parliamentary powers are being obtained, with the consent of the local authorities, for several other towns. A considerable number of private installations for country houses, &c., have been carried out, and this department of the business has been well maintained. Investments in the local companies in which the corporation is interested have been taken in the balance-sheet at cost price.

During the year, 9,400 ordinary £5 shares, the balance of authorised capital, have been issued and fully paid up. Further capital will be required for works in progress, and the directors recommend that the nominal capital be increased to £400,000, by the addition of 40,000 shares of £5 each, and propose that £100,000 be issued as 6 per cent. preference shares, reserving £100,000 for issue at a future time.

ELECTRICAL POWER STORAGE CO. (LTD).—The report of the directors states that the profit for the year ended May 31 was £5,309. 4s. 3d., and with the balance from last year (£554. 12s. 11d.), amounted to £5,863. 17s. 2d. Of this, £243. 1s. 1d. has been carried to reserve, and £1,000 to contingent fund, and the payment of a dividend of 5 per cent. on the ordinary share capital is recommended, which will absorb £4,362. 8s. 5d., leaving £258. 7s. 8d. to be carried forward. The buildings, plant, tools, &c., have been maintained in thorough repair and condition at a cost of £2,394. 10s. 2d. out of revenue. The demand for the E.P.S. batteries increases year by year, and the recent extension of the works is being fully utilized. The orders on hand are larger in amount than at any previous time, and include several for tramway and power stations

Digitized by Google

the special type manufactured by the company for this purpose having met with the entire approval of engineers. The development of the business has necessitated the introduction of further working capital, and a call of £1 per share has been made during the year on 3,132 ordinary shares on which only £3 per share had been previously paid.

GIFFRE ELECTRO-CHEMICAL POWER CO. (LTD.)—The directors' report for the year ended March 31, submitted at the meeting on 18th ult., expressed the directors regret that it had not been possible to obtain the immediate results anticipated when the company was formed. The directors were disappointed in the hope that from April of last year the output of carbide would have been considerable and regular. As soon as the turbines were set to work it became evident that they did not come up to what was expected of them, and it took considerable time to discover the cause and to remedy the defects. It was found advisable to cancel the order for the four additional turbines until this had been done, and then to order machines of a different type. The defects were being made good by the contractors, who were under obligation to deliver satisfactory turbines and to guarantee their working for one year. One type of dynamo also gave some trouble. Finally, the sudden increased demand for electrodes caused such a dearth that for a time they were unobtainable. Owing to the above causes and the inherent difficulties of getting such important works into working order, the amount of carbide produced to the end of last year was small, but since the beginning of the year a notable improvement had taken place. Against an intermittent output during last year of 633 tons, there was a steady output for the first three months of this year of 475 tons, already increased to 50 tons a week. It was found advisable to maintain the Société Electro-Chimique du Giffre as a separate company, and therefore not to complete the purchase of the whole of the shares. As the rent of the water power, which for 1899 amounted to 125,000f., was, in accordance with the lease, to be raised from Jan., 1900, to 250,000f., the directors of the French company decided that it was advisable to make the authorised issue of debentures for buying the water power outright, and this had been accomplished, and about £10,000 had been employed in enlarging the factory.

NEW COMPANIES, STATUTORY RETURNS, &c.

W. H. ALLEN & SONS (LTD.)—This company was registered on June 29, with a capital of £200,000, in £1 shares, to acquire the business carried on by W. H. Allen, Son & Co. at Queen's Engineering Works, Bedford, and to carry on the businesses of electricians, mechanical and electrical engineers, manufacturers of steam engines and boilers, ironmasters, &c.

ELECTRICAL TESTING LABORATORIES (LTD.)—This company was registered on June 26 with a capital of £3,000, in £1 shares, to take over the Westminster electrical testing laboratories, to establish, erect, maintain and work laboratories for testing, calibrating, or standardising electrical, chemical, or other machinery, &c. The subscribers are W. W. Norman, B. G. Battson, E. R. Blundstone (consulting chemist), A. Sharp (consulting engineer), S. Hutchinson, H. G. Palton, and T. I. Woods.

ELECTRO-MAGNETIC TRACTION CO. (LTD.)—This company was registered on June 27, with a capital of £1,500, in £1 shares, to adopt an agreement with H. Lane and W. Griffiths, and to carry on the business of electrical and mechanical engineers, and any other business connected with electric tramways and light railways, &c.

LEWISHAM AND DISTRICT ELECTRIC SUPPLY CO. (LTD.)—This company was registered on June 29, with a capital of £10,000, in £1 shares, to construct and to carry on at Lewisham, S.E., and elsewhere the business of an electric light company in all its branches, and to lay down and maintain mains, cables, wires, electrical machinery, &c. The subscribers (with one share each) are J. Atherton (manufacturer), W. M. M. Forwood, F. Horne, G. T. R. Collis, H. Perry, D. Gayler, A. Purnell.

PREMIER ELECTRIC LAMP CO. (LTD.)—This company was registered on June 26, with a capital of £100,000, in £1 shares, to adopt an agreement with the Premier Electric Lamp Syndicate (Ltd.), and to carry on the business of mechanical and electrical engineers, manufacturers of and dealers in lamps, wires, cables, accumulators, and appliances, suppliers of electricity for light, heat, motive power, or other purposes, &c. The subscribers, with one share each, are Ald. Lloyd Higginbotham (engineer), James B. Atherton (manufacturer), H. A. Watson, D. McKechnie, C. Petrie, T. Briggs, and Jacob Atherton (manufacturer).

ROSLING, APPLEBY & FYNN (LTD.)—This company was registered on June 25, with a capital of £100,000, in £1 shares (50,000 6 per cent. cumulative preference), to take over the business carried on by Rosling & Appleby, and to carry on the business of electrical and general engineers, electricians, motor-car manufacturers, wire drawers, &c. The subscribers are P. Rosling, H. W. Appleby, and V. A. Fynn (electrical engineers), R. Lord, H. O. Enrich (electrical engineer), P. Milne-Milne (mechanical engineer), and J. Orerend (works manager). The first directors are P. Rosling, H. W. Appleby, and V. A. Fynn.

ST. AUSTELL & DISTRICT ELECTRIC LIGHTING & POWER CO. (LTD)—This company was registered on June 27, with a capital of £10,000, in £1 shares (300 founders'), to apply for and obtain a provisional order for supplying electricity at St. Austell, Cornwall, and to carry on the business of electricians, electrical and general engineers, &c., and to enter into an agreement with the United Kingdom Tramway, Light Railway & Electrical Syndicate (Ltd.). The subscribers are J. M. Coon (engineer), H. Hodge, A. P. Coode, E. J. H. Bluett, Major H. Tulloch, J. Parnell, C.E., and W. H. Lawley.

SCHATTNER ELECTRICITY METER CO. (LTD.)—This company was registered on June 29, with a capital of £50,000, in £1 shares (12,500 deferred), to acquire the patents of Messrs. E. Schattner, F. M. Long and F. W. Harmer relating to electricity meters, with the business at Timberhill, Norwich, and to carry on the business of electricians, electrical and general engineers, manufacturers of electricity meters, &c. The first subscribers (with one share each) are E. Schattner (engineer), F. M. Long (engineer), J. C. Wrist, R. S. Baill, F. W. Harmer, R. J. Wallis-Jones (engineer), and A. M. Billington (engineer).

SOUTH LANCASHIRE ELECTRIC SUPPLY CO. (LTD.)—This company was registered on June 29, with a capital of £10,000, in £1 shares, to carry on in South Lancashire or elsewhere the business of electrical and mechanical engineers, electricians, suppliers of electricity, manufacturers of cables, wires, lamps and electrical appliances, &c. The subscribers are the same as those of the Lewisham & District Electric Supply Co.

TYPEWRITING TELEGRAPH CORPORATION (LTD.)—This company was registered on June 26, with a capital of £100,000, in £1 shares, to acquire and develop any patents relating to electric telegraphy or telephony, or the generation, storage, and transmission of electricity, to manufacture and deal in recording telegraph instruments and other electrical apparatus, and to enter into an agreement with the Recording Telegraphs (Ltd.) The prospectus of the company was reviewed in our last issue and we learn that the shares were fully subscribed.

CITY NOTES.

MEMORANDA.—Bank rate 3 per cent. (since June 14, 1900). Price of silver 28 7/8d. per oz. (July 5). Consols (2¾ per cent.) 99⅛—99⅜ for money, 99⅜—99½ for account; 2½ per cent. 99—99½ (July 5). Stock Exchange Settling Day: Consols, Aug. 2; Stocks and Shares Continuation Days, July 10 and 25; Ticket Days, July 11 and 26; Pay Days, July 12 and 27; Mining Share Carry-over Days, July 9 and 24.

CITY OF LONDON ELECTRIC LIGHTING CO. (LTD.)—Warrants for the payment of interest on the £400,000 5 per cent. debenture stock for the half-year ended June 30 have been posted.

EASTERN TELEGRAPH CO. (LTD.)—Subject to final audit the accounts show after payment of interest on 4 per cent. mortgage debenture stock, dividend on the 3½ per cent. preference stock to March 31, 1900, and the interim dividend of £1. 5s. per cent. on the ordinary stock to Dec. 31 last, a balance available sufficient to pay a final dividend of £1. 5s. per cent. and a bonus of £2 per cent., both free of income tax, on the ordinary stock, both payable on the 19th inst., making with previous payments on account a total distribution of 7 per cent. on that stock for the year ended March 31, 1900. The transfer books will be closed from July 11 to July 19 inclusive.

EASTERN EXTENSION, AUSTRALASIA AND CHINA TELEGRAPH CO. (LTD.)—The directors have declared an interim dividend for the quarter ended 31st March last of 2s. 6d. per share (tax free), payable on 14th inst. The share register is closed from 6th to 13th inst. inclusive.

W. T. GLOVER & CO. (LTD.)—Mr. A. H. Howard, who has been for some time manager of this company, has been elected to a seat on the board of directors.

GREENWOOD & BATLEY (LTD.)—The directors' report for the year ended March 31 states that, after providing for debenture interest and for management expenses, writing off £1,500 for depreciation on buildings and plant, and making due provision for doubtful accounts and allowances, the accounts show a net profit of £8,829. 7s. 4d., which with £2,955. 13s. 5d. from 1899 leaves £11,785. 0s. 9d. available for distribution. The directors recommend that dividends of 7 per cent. per annum on the paid-up cumulative preference share capital, and 2½ per cent. per annum on the paid-up ordinary share capital, absorbing £11,321. 15s. 3d., leaving £463. 5s. 6d. to be carried forward.

ROSLING, APPLEBY & FYNN (LTD.)—This company, which has a share capital of £100,000, in £1 shares, invites subscriptions for £15,000 6 per cent. cumulative preference shares and £15,000 4½ per cent. first mortgage debenture bonds of £50 each. The list closes to-day (Friday). Particulars of the registration of the company are set out in the current issue.

THOMAS PARKER (LTD.)—The annual meeting of this company was held at the works, Wolverhampton, on June 29, Mr. C. T. Mander presiding. The chairman said that for the year under review it was proposed to declare a dividend of 10 per cent., which he considered was most satisfactory. The fact that they were able to hand over £5,000 to the reserve was also satisfactory. They had not made so much gross profit during the year as in the previous one, which was hardly to be expected, because the price of materials of all sorts had gone up, and they had not thought it policy to increase the price of their manufactures in like proportion. He thought, however, the 10 per cent. dividend, and the £5,000 going to reserve, would be considered satisfactory. The directors' report was adopted.

STOCK EXCHANGE NOTICES.—The 4th inst. has been appointed a special settling-day in 70,000 five per cent. cumulative preference £1 fully-paid shares (Nos. 1 to 70,000) of the *Alliance Electrical Co.* (*Ltd.*) and the fully and partly paid provisional certificate for £100,000 five per cent. second debenture stock of the *Edison & Swan United Electric Light Co.* (*Ltd.*). The first-mentioned securities have also been ordered to be quoted in the official list. Application has also been made to the committee to appoint a special settling day in and to grant a quotation to the further issue of 30,100 ordinary £5 shares of the *Westminster Electric Supply Corporation* (*Ltd.*) and to allow the £500,000 four per cent. debenture stock and the further issue of 100,000 ordinary £5 fully-paid shares (Nos. 490,001 to 590,000) of the *National Telephone Co.* (*Ltd.*) to be quoted in the official list.

Digitized by Google

TYPEWRITING TELEGRAPH CORPORATION (LTD.)—We learn that the issue last week of 53,334 shares of £1 each in this company was fully, in fact, somewhat over subscribed, and the directors have proceeded to allotment. We may further state that the underwriters were relieved of their liablity, as the public came in and took the whole of the issue.

UNION ELECTRIC LIGHT & POWER CO.—Notice is given that £5, less tax, will be paid by the National Provincial Bank of England, 112, Bishopsgate-street, London, E.C., upon each $1,000 first mortgage 5 per cent. gold bond of this company deposited under the reorganisation scheme.

VOLENITE (LTD.).—A meeting of shareholders was held in Dublin on Thursday last, to consider a proposal of the Rhea Insulite Synd. to purchase the assets of the company. Mr. Thomas Falls presided, and said the proposal would come before another meeting of shareholders in London on Wednesday. The present meeting was called to ask the opinion of the Irish shareholders as to the sale. The investigation committee of the Fish, Oil & Guano Co. had decided that they could not recommend the sale at the price offered. Mr. Reeves said the works were in a state of chaos, and thousands of pounds worth of machinery had never even been unpacked. He thought the directors should be asked to explain why the business had been allowed to drift into its present condition. Mr. Kilbey said that unless they got 200,000 shares and £50,000 cash they should oppose the proposed sale. The resolution was adopted refusing the offer of the syndicate.

At the meeting in London on Wednesday, the chairman (Mr. A. J. Dudgeon) said that in March last the directors were approached with a view to the sale of the company's works at Alpertone and the British patent for volenite, &c., by a syndicate interested in the production of a mechanical rubber, and from whom, whilst under Mr. Lamplough's management, the company had received an order for 1,000 tons of raw material. There were good and substantial reasons why it was advantageous to agree to the proposed sale. This company would then have, besides the shares in the new company, the property at Gorleston, plus its foreign patents. As regarded the ability of the Rhea Syndicate (the proposed purchasers) to carry out its part of the engagement, they were assured, and believed, it had all the necessary financial power. The rejection of the offer of the syndicate was moved by Mr. T. Falls and this was carried practically unanimously. The chairman said that as the shareholders had rejected the offer the present directors would remain in office for a few days to enable a new board to be elected.

WEST AFRICAN TELEGRAPH CO. (LTD.)—The numbers are set out on another page of a drawing, on 3rd inst., of 155 5 per cent. mortgage debentures of £100 each in this company, which will be paid off at par on Sept. 1 at the National Bank of Scotland (Ltd.), Nicholas-lane, Lombard-street, London, E.C.

NOTES.

It is satisfactory to note that the remaining three important power bills—the South Wales, the Lancashire and the Durham County bills—have finally passed the committee stage in the House of Commons, and have been reported for third reading. We are also gratified to see that the ambiguities pointed out in our recent leading article have been to a large extent removed by the final wording of the clause defining and limiting the powers of the companies supplying electrical energy, and of the local authorities within the areas affected.

Local authorities have done much to impede the advance of electrical engineering in this country by their opposition to new tramways and power distribution schemes, but the climax has surely been reached when the Richmond Town Council actually protests against the establishment of a National Laboratory in the borough of Richmond to promote the development of physical science and of the industries depending upon it. The contention that a physical laboratory is likely to disturb the quietness of the neighbourhood is flagrantly absurd. We are glad that a counter-deputation of those interested in the National Physical Laboratory has applied the necessary correcting coefficient to the ideas which the first deputation sought to impose upon Mr. Hanbury.

In our Parliamentary Intelligence columns will be found answers by Mr. Ritchie in the House of Commons on the subject of wireless telegraphic communication with lightships. An inter-departmental committee has been appointed to consider the question. As long ago as October, 1897, the Royal Commission on Electric Communication with Lighthouses and Lightships recommended in their final report :—

> Having regard to the present expense of establishing and electrical communication with light vessels, the Commissioners do not fee justified in recommending the connection of any more of those stations until the ethereal system at present under trial has been fully tested. In the event, however, of any improved system rendering the maintenance of communication with light vessels less costly than it now is, they are of opinion that the East Goodwin, Cross Sand, Kish, Tongue and Sunk lightships have the first claims to consideration, together with the Scarborough lightship already recommended.

The "ethereal system" can be deemed to have long ago passed the experimental stage, so far as communication between lighthouses and lightships and the shore is concerned, and it is certainly not costly; yet, while both France and Germany have already made successful use of it for this purpose, the supreme maritime power has got no further than to relegate the matter to an inter-departmental committee.

Signor Tommasina's observations on the luminosity of the elongated primary Hertzian wire known in wireless telegraphy as the mast-head wire or "feeler" (*antenne*) promise to furnish some valuable indications with regard to the efficiency of the various connections and apparatus used. For the luminous phenomena described in Mr. Fournier d'Albe's note in another column are in intimate relationship with the period of the oscillator and of the induction coil; and if they can furnish a test for the synchronism of both they may also serve to reveal other advantages or defects. From the point of view of efficiency, the very occurrence of such luminous effects is of course a sign that there is something wrong, for the energy spent in producing both these and the sound effects sometimes heard is deducted from the supply of energy available for the transmission of the signals. From the theoretical point of view, however, the effects described are of great value and interest. The waves emitted by the vertical feeler are cylindrical waves. They are not the waves as ordinarily transmitted along a wire system like that of Lecher, but are of a secondary type produced by the abrupt termination of the wire. The luminous effects are evidently connected with the finite conductivity of the wire. An examination of their behaviour in a vacuum would probably reveal some close relations between them and the ordinary luminous effects in a vacuum tube.

Within the last few days we have had the opportunity of inspecting two different specimens of instrument, termed by their inventors "telephonograph" or "telegraphone," but for

Digitized by Google

which we would suggest the simpler name "recording telephone." The idea is one that has been self-evident since the introduction of the telephone and of the commercial form of phonograph, viz., that it should be possible, by a combination of these two instruments, to record a message transmitted from a distance through an ordinary telephone line. We believe that EDISON worked at this problem, and that he even constructed a working instrument in his laboratory; at all events, this was among the applications of the phonograph which were suggested when the wax cylinder instrument was first put upon the market. Possibly EDISON, who has always been an acute man of business, did not consider that the financial gain accruing to the maker of such a machine would compensate for the time spent in working out the necessary details. Now, however, that the telephone has become almost one of the necessities of commercial and social life, an efficient and reliable recording telephone is certainly a desideratum, and it is to be hoped that the necessary details of the construction and application of such an apparatus will soon be worked out.

A LOUD-SPEAKING telephone, held in front of a receiving diaphragm of a phonograph, will undoubtedly cause a record to be traced on the wax cylinder, but the result, on reproduction, is a considerable distortion of the voice. Mr. E. O. KUMBERG, whose instrument we examined and tested at Messrs. JOEL & Co's offices this week has, it appears, set himself the task of diminishing this distortion, but up to the present it can hardly be said that he has been eminently successful. He makes use of the ordinary phonograph, adding to it only a loud-speaking telephone receiver in place of the usual receiving diaphragm. This attachment is a large two-pole receiver with a strong magnet of elliptical section similar to that of the two-pole Bell receiver, but larger. This is enclosed in a brass cylinder, and a fairly thick tin plate serves as a diaphragm and is clamped with a brass drumhead. Attached to the centre of the diaphragm is a short stiff wire terminating in the centre of a mica diaphragm, to which it is also rigidly attached. A brass eyelet is let into the middle of the mica diaphragm, and the cutting style is connected to this by a simple chain link. The style is hinged, and a hinged brass flap, to which the fulcrum of the style lever is attached, acts as a weight, pressing the style against the wax cylinder and compensating for any inequalities in the surface of the latter. This arrangement, when used with a "Hunningscone" transmitter and four No. 2 wet porous-pot Leclanché cells, certainly reproduced sounds loudly, and also traced a record on the phonograph cylinder deep enough to actuate the ordinary speaking diaphragm; but the articulation was in both cases most indistinct.

THE other instrument, due to the Danish engineer WALDEMAR POULSEN, was referred to in *The Electrician* for May 4th last, and is described in one of Mr. FOURNIER D'ALBE'S notes in this issue. The apparatus is on view at the Paris Exhibition, but it is not actually in operation there. In the experimental type, shown a steel wire is wound spirally on an insulated cylinder which is rotated by clockwork, moving forward each revolution by a distance equal to the pitch of the spiral. A small electromagnet is connected in place of the receiver when receiving and simply in series with the local receiver when recording. The same magnet also serves for erasing the record when traversed by a continuous current. The speed at which the wire moves past the electromagnet is very fast; in the portable instrument shown at the Paris Exhibition it only takes three minutes for it all to pass. Some idea of the experimental stage in which this invention still is, may be gathered from the fact that it was found too difficult at the Exhibition to make the necessary adjustments in order that the working of the apparatus might be demonstrated to visitors. A cheap and efficient recording telephone would certainly be a boon to telephone subscribers, but its realisation appears at present to be somewhat remote.

The 1,000 Miles Automobile Trial.—The judges' report on this trial, which took place between April 23 and May 12, together with the list of awards, has been issued. The conditions were such, however, that no electric vehicle took part in the contest.

Canadian-Azores Cable.—Messrs. Siemens Bros. & Co.'s cable steamer "Faraday" arrived at Fayal, Azores, on Tuesday afternoon, all well, and proceeded to lay the shore end of the Fayal-Canso cable for the Commercial Cable Co. As stated in a previous issue, about 600 miles of this cable were laid some time ago from Canso towards the Azores.

University of Birmingham.—At a meeting of the Council of the Birmingham University on Friday last week, the new Principal, Dr. O. J. Lodge, was welcomed by the Vice-Chancellor. A communication was also received announcing the election of Prof. Poynting as Dean of the Faculty of Science. Mr. G. Leigh Shakespear has been re-appointed assistant lecturer in physics.

Long Distance Power Transmission.—With regard to Prof. Forbes' Paper before the Institution of Electrical Engineers "On Distant Electric Power Transmission," Mr. Reginald Wood writes us that "the most advantageous method of transmission" was described in his patent specification No. 10,218 of 1893, and that it is to have frequent feeding points and "on each feeding point to have an accumulator and boost on the current to the next feeding point so as to keep the line under full pressure."

Electrical Winches and Cranes.—In the course of the report of the chief inspector of factories for the year 1899, it is stated in the section referring to dock accidents, that there is a decided tendency to replace many existing steam cranes by hydraulic cranes or electric winches and crabs, except in those docks where only few cranes are necessary to cope with all the traffic. Steam cranes, however, appear likely to continue in use at smaller wharves and quays, where they have to carry goods from one spot to another as well as hoisting them. It appears that hydraulic cranes are at present employed to a greater extent than electric cranes, the report stating that the latter are in use in only a very limited number of docks or wharves.

Obituary.—We regret to report the death of Señor Don Francisco de Paula Vasquez, who died at Madrid on the 24th of last month after a short illness. Señor Vasquez, who was only 61 years of age, had been a high official in the Cuerpo de Telegrafos, and was Honorary Local Secretary in Madrid of the Institution of Electrical Engineers, as well as agent for the Spanish National Telegraph Co. and the South American Cable Co. Many of our readers will have pleasant recollections of meeting Señor Vasquez at the telegraph conference at Paris, where his kindly humour and sympathetic manner gained for him many English friends, who will join in expressing condolence with his family and with his many friends in Spain.

Continuous v. Polyphase Current for Electric Tramways.—In a Paper read before the Zürich Engineering and Architectural Society, an abstract of which is given in the *Journal* of the Institution of Civil Engineers, M. E. Huber gives a table showing the comparative costs of installation of an electric tramway 12½ miles long in the two cases of continuous and polyphase current. The calculation is based on a service of five cars in use at once, one car at each end, and the remaining three at a distance of three miles apart; each car is assumed to take 20 kw. The tram is made up of a motor-waggon and one or two trailer cars, the whole weighing 20 tons. The maximum gradient is assumed to be 1 in 20. The trams run at intervals of 30 minutes at speeds of 12 to 15 miles per hour. The overhead trolley system is assumed to be used, and the pressure for continuous or polyphase current is in both cases taken as 500 to 600 volts. In the case of continuous-current working, with the generating station in the middle of the line, and an efficiency of 80 per cent., the total cost of the electric part of the work in the power station, along with overhead wire to feeders, would be £4,600 and an annual expenditure of £532 for wages, interest and sinking fund; with polyphase current the initial cost would be £5,400, and the yearly expenditure £618. 16s. If the generating station were at the end of the line, and the efficiency again taken as 80 per cent., the total initial costs for the continuous and polyphase currents are calculated to be £10,000 and £5,500 respectively, and the annual cost £856 and £626 respectively. With the station at the end, and transmission by polyphase current, and feeding by continuous current with an efficiency of 70 per cent., the figures would be £8,720 and £1,099.

Electrical Power Distribution in Factories.—The *Engineer* states that the motive power for the works of the Westinghouse Air Brake Co., formerly consisting of a central boiler plant, supplying steam to 30 Westinghouse steam engines located in the various buildings, has been recently replaced by electrical power, generated at a central station and distributed to the several shops. There was about 4,000ft. of steam piping, the condensation in which represented a loss of about 50 H.P. The boiler plant remains unchanged, and consists of 16 Babcock and Wilcox water-tube boilers, aggregating 2,000 H.P., fed by automatic stokers and worked at 125lb. pressure. The ratio of grate surface to heating surface is as 1 to 52·8. The only ones of the former steam engines which have been retained are two of 10 H.P. for the exciters, and those for the stokers, air pump, and rotary pump in the boiler house. In the power station are three Westinghouse-Parsons steam turbines, each coupled to a bipolar alternating generator, running at 3,600 revs. per min., and delivering current at 400 volts. There are also two exciter units, delivering current at 100 volts, the air pumps and condensers for the turbines, driven by a 50-H.P. motor, and two air compressors driven by 100 H.P. motors. All the motors are of the Westinghouse induction type, belted to the original line shafts, which run at 112 to 175 revolutions, an increase of about 12 per cent. in speed. Countershafts are largely dispensed with. In the machine shops there are 25 motors aggregating 435 H.P.; boiler house, three motors, 60 H.P.; blacksmith shop, two motors, 50 H.P.; brass foundry, three motors, 35 H.P.; iron foundry, 13 motors, 185 H.P.; leather room, two motors, 25 H.P. Total, 48 motors, 790 H.P. There are also 2,500 incandescent lamps and 60 arc lamps of 100 hours' capacity, all taking current at 110 volts.

Photometry of Enclosed Arc Lamps.—At the Convention of the American National Electric Light Association, held in Chicago last month, a report on this subject was submitted by a committee, consisting of Henry W. Doherty, W. E. Goldsborough, and J. Q. Brown, appointed to carry out measurements on various types of enclosed arc lamps, under various conditions of current supply. By an ingenious arrangement of apparatus, devised by Prof. C. P. Mathews, who carried out all the photometric measurements, it is stated that the measurements were carried out with an accuracy equal to that with which the comparison of monochromatic sources can be made. Two mirrors, placed on either side of the arc, were used to reflect the light on to the photometer screen, and a sectored disc was used to reduce the intensities of the two lights to be compared down to a point at which the colour difference ceased to be troublesome. The experiments were made with enclosed arcs only, and the following results for watts per c.p. were obtained, the arc being here considered as a light producer and not as a light distributor. I. Continuous current 110 volts—(i.) Opalescent inner globe, no outer, 2·10 watts per c.p.; (ii.) Opalescent inner, clear outer, 2·66 watts per c.p.; (iii.) Opalescent inner and outer, 3·04 watts per c.p. II. Alternating current, 110 volts—(i.) With clear outer globe, 2·62 watts per c.p., and (ii.) with opalescent outer globe, 3·20 watts per c.p. A suitable shade was stated to increase the mean spherical intensity of a lamp having a clear outer globe, in the ratio 254 : 169—*i.e.*, by 50 per cent. The conclusion finally arrived at by the committee is that, with a suitable shade such as it is recommended should be invariably employed for street lighting, the direct-current enclosed arc, without shade, gives 89 per cent. more useful light than the alternating current enclosed arc, with shade, and at slightly greater economy. The above candle powers are all expressed in Hefner units.

Power used in Machine Tools.—The *Engineering Magazine* quotes from an article by Herr Loch in *Glaser's Annalen* some interesting information as to the power required by various machine tools in the railway shop at Gleiwitz. In this shop there are 107 electric motors of various sizes used for running tools and other machines. When the machines were bought it was found that the makers themselves were generally ignorant of the power required to run them, and so there were some mistakes made in choosing suitable motors, some being too weak and some too strong for the work they were called upon to perform. A great many measurements were taken at Gleiwitz to determine the proper size of motor to run the various machines, and there is a list of 57 tools, with their corresponding motors, in the original German article. Among other results, it was found that a planer with a working surface 300cm. by 100cm. needed a 5 H.P. motor, while another one, 160cm. by 85cm., took 3 H.P. A shaping machine, with a 30cm. to 40cm. stroke, used 2 H.P., the same as a circular saw 50cm. in diameter, while small and medium lathes required 1 H.P. to 2 H.P. A horizontal milling machine was satisfied with 1 H.P., borers and drills of various styles and sizes needed from 1 H.P. to 6 H.P., emery wheels, 2 H.P. to 4 H.P. The no-load power consumption of car-wheel lathes of different makes varied from ·63 kw. to 1·9 kw. The reversal of the motion or the quick back-stroke of the working parts often, it is stated, demands the greatest outlay of energy, in the wood-planing machines, for instance, requiring more than the working stroke. The influence of different speeds on the power consumption is shown by the following example: A shaping machine required 1·7 kw. to 2·3 kw. at starting. When running light is used:—

At 10 strokes per minute and 18cm. length of stroke, 0·46 kw.				
At 16	ditto	18cm.	ditto	0·53 ,,
At 24	ditto	18cm.	ditto	0·59 ,,
At 38	ditto	18cm.	ditto	0·85 ,,
At 38	ditto	10·5cm.	ditto	0·63 ,,
At 38	ditto	30·9cm.	ditto	1·38 ,,

When working with a 4mm. cut, at 16 strokes per minute and 18cm. length of stroke, only 0·85 kw. was consumed.

The 107 motors in the main shop have a combined output of 334·5 H.P., and require 331 kw. at their terminals, or 347 kw., including the loss in the conductors leading to them.

Digitized by Google

If all the motors had been made large enough for their work, they would have had an output of 454 H.P., and the corresponding consumption of energy would have been 426 kw., or 461 kw., including the line drop. When running under normal conditions the motors use, on an average, from 250 amperes to 450 amperes, at 220 volts. The total energy consumed per month is about 15,000 to 20,000 kilowatt-hours. From these figures it follows that the average load of all the 107 motors is only from 16 to 29 per cent. of their normal capacity.

A Portable Zinc—Lead-Peroxide Primary Battery.—In Nos. 8 and 9 of the *Centralblatt für Accumulatoren und Elementenkunde* Herr W. A. Th. Müller gives a description of a portable zinc—lead-peroxide cell, which was exhibited at the Berlin International Motor Exhibition last year, and curves are given showing the output of the cell under different conditions. The chief feature of novelty in the construction of the cell is that the electrolyte is contained in a concentrated form in the pores of the peroxide plate, and that the plates when once thoroughly formed, can be kept stored away without deterioration for nearly a year, and when they are required for use a normal electrolyte is obtained by placing them in water. The lead peroxide plates are of the lattice grid type, and the wide meshes are filled in with an active material composed of litharge and alum crystals blended into a plastic mass with a solution of caustic potash by a patented process. The result is a very hard and porous plate. When the forming process is complete the plates are raised from the bath and run along on a carrier to a drying chamber, where all the water is evaporated from them, so that when they are lowered into a vat of strong sulphuric acid they absorb it freely. When the absorption is complete the plates are lifted out of the acid and coated with dry, ground potassium silicate, to prevent the sulphuric acid taking up moisture from the air, and after this coating the plates are stored away in a dry place. The negative electrodes used in this cell are formed of zinc plates, whose thickness varies from 1·5mm. to 3mm. according to their size. These plates are set up in hard rubber or celluloid boxes, so that there is room between them for the insertion of the peroxide plates. The battery boxes are closed by covers provided with contact knobs which make connection between the individual plates of like sign, which answers well for small currents, and has the advantage that when the lid is removed any plate can be taken out separately for examination without disturbing the remainder. For large currents the method is unsuitable, as the heating of the knobs causes the celluloid to take fire, and so lead-coated iron hooks have to be employed. When the battery is discharged the peroxide plates are removed and regenerated, and the spent solution is withdrawn. The cells are filled up with fresh water, and fresh peroxide plates are inserted, when it is required to use the battery again. The zinc plates can be used several times before they require renewal, so that all that is needed to enable the battery to work continuously is to keep a supply of peroxide plates close at hand. These positive plates are made by Adolf Krüger, of Berlin, according to Messrs. Rothmund von Burgwall's and L. Ofenschüssl's patent. In his article Herr Müller describes experiments which have been conducted with this battery, and discusses the economic considerations involved in its use.

Light Railway Commission.—In a Paper read at the recent meeting of the Tramways and Light Railways Association at the International Tramways and Light Railways Exhibition, Mr. R. H. Scotter reviewed the work of the Light Railway Commission since it came into existence. Referring to the non-political or rather dual-political character of light railway agitation, and the rapidity with which the facilities afforded by the Light Railways Act of 1896 were taken advantage of all over the country, he stated that, as the act itself expires next year, the Association would render a service to the public and the tramways and light railways industry generally by discussing freely the working of the act and submitting to the proper quarters some practical suggestions for its improvement. He considered the delegation of the duties hitherto performed by the House of Commons to the Board of Trade and Light Railways Commission had been an unqualified success, as the system of local inquiry had done much to interest local bodies and the public generally in our railways and tramways. As evidence of the success of the movement, he gave the following figures:—

> Between December, 1896, and May 31, 1900—3½ years—proposals, plans, and estimates have been received by the Commission for a mileage of 2,800 miles, a length greater than the total mileage of Irish railways, equal to the London & North-Western and London & South-Western combined, and greater than our longest railway, the Great Western, and more than double the total mileage constructed in 30 years under the Tramways Act. . . . Places as far distant and as dissimilar as Penzance, Wick and Inverness, Colwyn Bay, Bedgelert and Southend-on-Sea have benefited by the act, as well as the most thickly populated manufacturing centres in the North and Midlands of England and in the metropolitan area. During the years 1897-8-9-1900, the Commissioners have held 208 local inquiries into the merits of 247 schemes, the general result being that 55 per cent. were granted, 24 per cent. rejected, 14 per cent. withdrawn, and 7 per cent. remain to be dealt with.

While the Commission itself has, in Mr. Scotter's opinion, done its work well, he finds fault with the delay due to other sources in putting schemes into effect:—

> When the Light Railway Commissioners have satisfied themselves that a scheme is a good one, we should think the Board of Trade, the Commissioners, promoters, solicitors, and all concerned, would hurry matters forward, so that the line might come into existence as soon as possible. But such is not recent experience. . . . The average time between the deposit of the plans and the issue of the order is 16 months, or nearly double the time required for the obtaining of similar powers per Act of Parliament or provisional order. Of this period not more than six months elapses between deposit and local inquiry; hence, on an average, 10 months are occupied in the process of "settling the order." Here, then, appears to be one weak spot in the constitution of the Light Railway Commission. More help is required, in order that the order, when once approved, may be rapidly settled. This point has been brought out very forcibly by the Commissioners in their reports.

He suggests as a remedy for this evil an increase in the number of Commissioners and the granting to them of some additional powers by which they might spur on promoters, objectors, and their solicitors to prompt action within a given time. He next refers to the relations between light and heavy railways, pointing out that the former tap new districts, and that they must rely largely on creating new traffic. "When it has been created and nursed it will not be fair that our quasi-benevolent neighbours—the railway companies—should *then* swoop down and take all the profit." The author also warns promoters that some County Councils (other than the London County Council) are making efforts to obtain a clause in each light railway order in their area that, at the expiration of 25, 30, or 35 years, they shall have the power to purchase the undertaking if the local authority fail to do so. On the terms of the act and the relations between light railways and tramways, the following passage is of interest:—

> Cannot this new bill be made to settle once for all the supposed difference between a light railway and a tramway? Cannot we ineist upon the Tramway Act, 1870, being revised at the same time? I beleve it will be possible to effect such a change, if we show ourselves desperately in earnest about the matter. It will be noted that the Light Railway Commissioners themselves divided all applications into two classes: (*a*) Light railways resembling ordinary railways; (*b*) Lines which may be shortly described as road or street railways. By approving over 250 miles of the latter class, they have set their approval on the use of the ordinary roads of the country for the carriage of both passengers and goods traffic. I believe this practice to be a good one, and that it opens up an enormous field for electric traction, as steam locomotion is by no means suitable for this purpose. . . . In revising the Tramways Act our policy must be to get rid of Clause 43. Parliament has gone half way by allowing promoters of light railways a longer time than 21 years in which to recoup themselves. Here, again, tramways and light railways should be put on the same footing.

Finally, the author says:—

> On the question of financing light railway and tramway undertakings, I will content myself with mentioning the fact, that although Parliament some four years ago sanctioned the spending of £1,000,000, by way of loans at 3½ per cent. for the purpose of helping the development of light railways, the concession is so hedged in by "provided thats," that so far only half-a-dozen grants have been promised. I think that the future of the movement depends very largely upon the support private enterprise can give it, and in this direction I would point out that, although investors have not given great attention to light railways, they will certainly become paying concerns in the future. The Board of Trade and the Light Railway Commissioners exercise such a rigid control over the financial side of the matter, that over-capitalisation is practically impossible.

The Power Station (continued).—Continuing our description of the equipment of the power station, our readers will remember that we were describing the main generating sets when the course of our articles was interrupted by the opening ceremony. These six three-phase sets are all constructed alike, and possess the same electrical, magnetic and mechanical characteristics. An immense number of tests have already been carried out upon these generators, the results of some of which are embodied in the accompanying series of curves, Figs. 18 to 26. The weight of the magnet wheel is 34,000lb.,

space set apart for the exciter sets and the station lighting sets. The exciter sets shown in Fig. 28 are four in number. Each consists of a vertical enclosed tandem compound single-crank Allis steam engine, direct-coupled to a multipolar continuous-current Westinghouse generator. Each set runs normally at 400 revs. per min. The engine cylinders are 9½in. and 15in. diameter respectively, and the stroke is

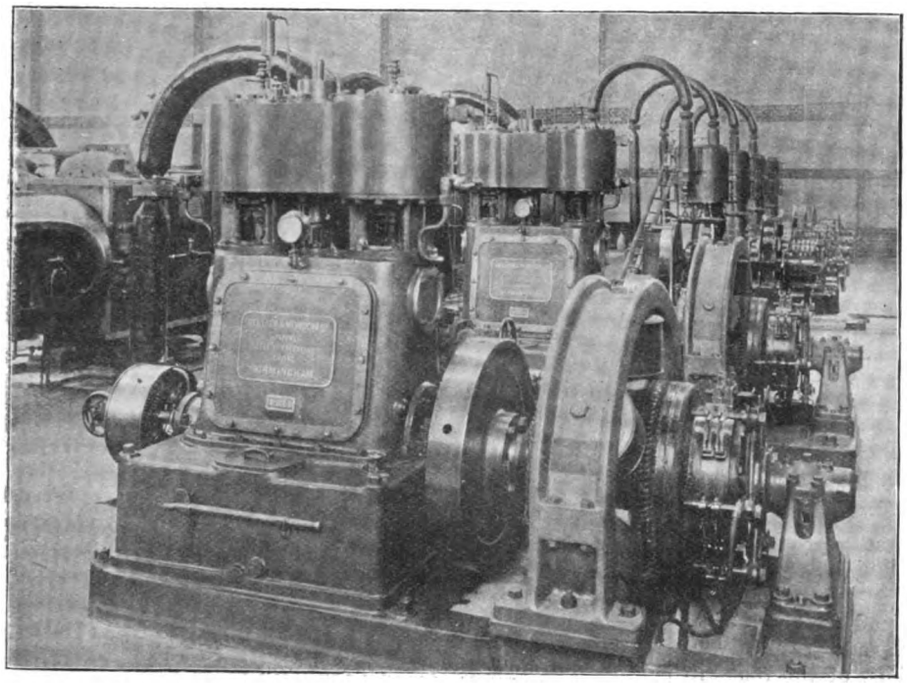

Fig. 29.—View Showing the Two Station-Lighting Sets in Foreground.

6in. At the normal speed, the rated output and pressure are 50kw. at 125 volts. The exhaust steam from these exciters, as also from the two station lighting engines, is taken to a Wheeler surface condenser in a small annexe adjoining the main machinery room. The station lighting sets, two in number, are shown in Fig. 29. They differ considerably from the exciter sets, consisting as they do of Belliss enclosed vertical two-crank steam engines direct coupled to Westinghouse multipolar generators. The output of these sets is also 50kw., and the dynamos have also the same number of poles as in the exciter dynamos, viz., six poles. Connections from the exciter and station lighting sets are taken to special panels on the main switchboard, which is erected on a spacious gallery almost immediately over the sets. In our next article we shall describe these switchboard arrangements.

(To be continued.)

SWANSEA ELECTRIC TRAMWAYS.

Swansea, although ranking as the second town in Wales, has taken the lead in adopting electric traction. On Saturday, June 30th, the electrical working of the Swansea tramways system was successfully inaugurated. It is hardly necessary here to say more about the history of the inception of electric traction in this town beyond recalling to our readers' memories the fact that in May, 1897, the Corporation applied to Parliament for a bill empowering them to purchase the tramway undertaking of the Swansea Improvements and Tramways Co. The Corporation proposed substituting electric traction for horse power, erecting a dust destructor, and putting into effect their electric lighting powers. These proposals, known as the triple scheme, met with such effective opposition that the bill was rejected, whereupon, in July of the same year, the tramways company in the face of the Corporation's opposition successfully applied for powers to convert their lines for electrical operation, subject to their keeping the roads in repair to the satisfaction of the Corporation. Eventually the British Electric Traction Co. acquired the undertaking, and proceeded to equip the lines on the overhead trolley system.

Owing to delay in the delivery of plant, the work of conversion was seriously hindered, and it was not completed till the early part of May, although a trial trip on the Cwmbwrla route took place about the beginning of April.

The accompanying sketch plan shows the present extent of the tramways. It will be noticed that the tramway depôt and power station is situated at St. Helen's—at one end of the system. The site is that of the old tramways depôt and the original car sheds have been reconstructed and fitted with the necessary pits for the inspection and repair of the motors and trucks.

Although at present excentrically situated, the power-house will be quite central when the company has converted the Mumbles Railway (now worked by steam) to electric traction. The eastern end of this latter line, is shown in Fig. 1 terminating near the Victoria Station of the London & North Western Railway. The total length of this light railway from Swansea to within about a mile of Mumbles Head, the western horn of Swansea Bay, is about 5½ miles. The company has taken up a long lease of this railway as well as the pier and intends to adopt electric tractionon it as soon as possible.

The total length of route at present served by the tramways is about 5½ miles, and the system may be described as consisting of an almost complete little loop in the town from which there radiate four branches—one to the power station at St. Helen's, one to the docks, a third to Cwmbwrla, and the fourth (and longest) to Morriston. Three feeders leave the station and serve respectively the centre of the system,

Digitized by Google

the Cwmbwrla and the Morriston branches. The most hilly route is that to Cwmbwrla, but there are practically no bad gradients in combination with curves. The chief gradient is one of 1 in 22, although there is a trifling length at 1 in 15. The sharpest curve is one of 40ft. radius.

Our Figures 2, 3 and 5 give examples of the span wire, bracket arm, and centre pole line work employed at Swansea. Fig. 5 shows the work at Cwmbwrla bridge. The trolley wire is of No. 0 S.W.G. (0·324in. diameter) copper and the metals of 86lb. girder rail. The return circuit afforded by the rails is supplemented from a point half-way along the

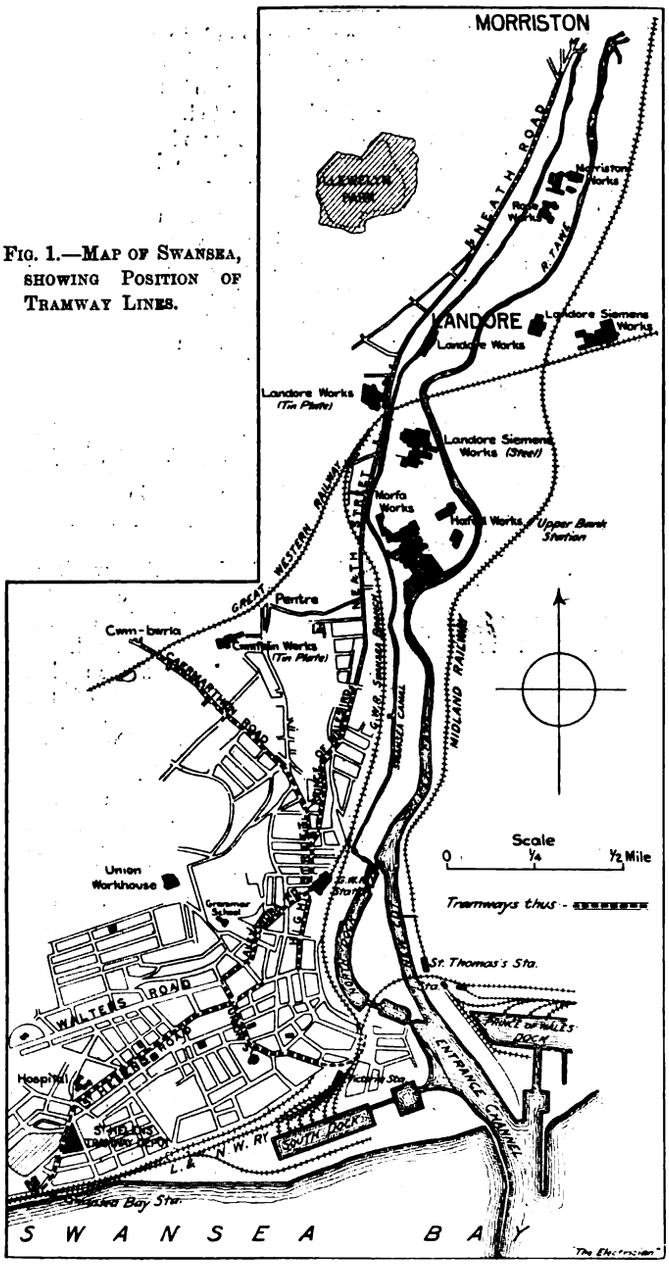

FIG. 1.—MAP OF SWANSEA, SHOWING POSITION OF TRAMWAY LINES.

Morriston section by two 37/12 Callender lead-covered cables. The feeders, also Callender lead-covered, and respectively 37/13, 37/16 and 19/16, are laid at the sides of the roads in cast-iron piping and feed into the trolley wire at intervals of half a-mile, lightning arresters being installed at the feeding points. The Morriston feeder has a total length of about $2\frac{1}{4}$ miles and the Cwmbwrla one $1\frac{3}{4}$ miles.

Coming to the power station, the buildings include an engine room, 65ft. by 29ft., and a boiler-house, 37ft. wide by 39ft. long. All the electrical work, including the lines, has been carried out by the British Electric Traction Co. for the tramways company. The station buildings were erected by Messrs. Walters & John, of Morriston, from the plans of Mr. J. P. Rowlands, of Swansea. The boiler-house contains at present two of the largest size Babcock & Wilcox boilers, each capable of evaporating 7,000lb. water per hour under a pressure of 150lb. per square inch from a feed temperature of 150°F. A Babcock & Wilcox superheater enables an extra 100deg. of temperature to be raised on the steam. This

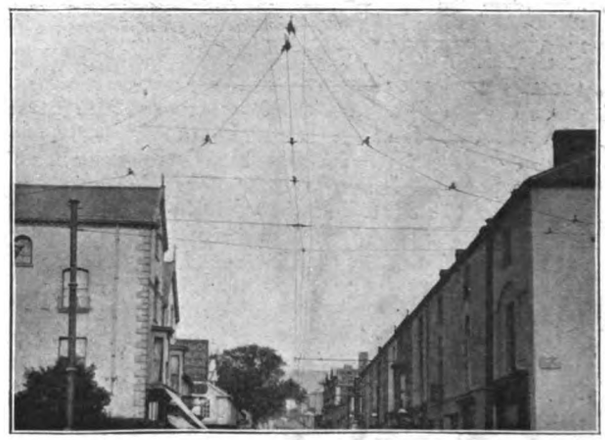

FIG. 2.—SPAN-WIRE CONSTRUCTION.

superheater is flooded when not in use. Coal for the boilers before being tipped into the bunkers passes over a weigh-bridge conveniently situated just outside the boiler-house approach. Two small weighing machines enable the firemen to record the quantity of coal used during their shift.

The gases from the furnaces pass either through a Green's 160-tube economiser or, by means of a bye-pass, direct to the

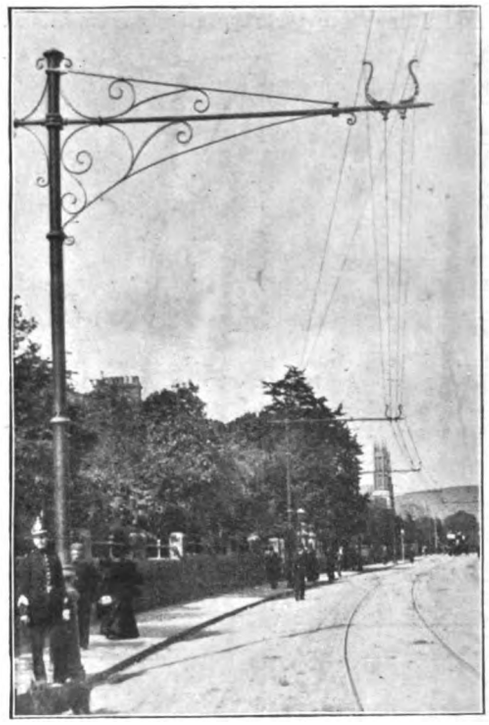

FIG. 3.—BRACKET POLE WITH GUARD WIRES.

chimney-shaft. The economiser scrapers are, as usual, worked by an electric motor. In Fig. 6 is shown some of the auxiliary plant serving the boilers.

For condensing purposes two wells have been sunk on the station site each 36ft. deep. Water is pumped from these up to two tanks on the roof, and, to facilitate the cooling of this water, which is used for circulating in the condenser, Körting

sprayers are installed. The condenser is a Wheeler horizontal surface one of 700 sq. ft. area. The water is normally circulated by means of a Brush motor-driven centrifugal pump, but this, as well as the Crompton motor-driven feed-water pump, is supplemented by Blake & Knowles steam feed and circulating pumps. The circulating pumps are each capable of delivering 14,000 gallons of water per hour. The air-pump is of the vertical type, by W. H. Allen, Son & Co. Water for feed purposes is stored in two large tanks side by

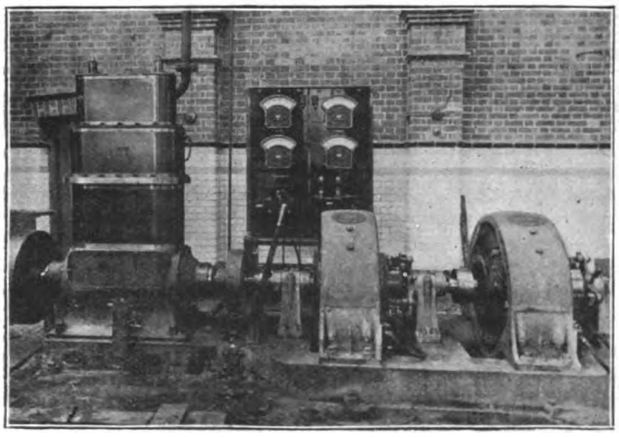

FIG. 9.—ALLEY & MACLELLAN—BYNG-HAWKINS DOUBLE SET.

side with the circulating water tanks, but the feed-water originally is taken from the town supply. Provision, as usual, is made for exhausting into the atmosphere, the bye-pass to the air being automatic in the event of, for instance, the air-pump failing.

The two boilers deliver by 6in. pipes into a 7in. main steam pipe, from which the engines are fed. Geipel steam traps drain the pipe arrangements of condensed steam.

generator over-compounded to compensate for feeder drop, and capable of meeting a load of 365 amperes at 550 volts.

The third set comprises a 50 B.H.P. vertical tandem-compound engine by Messrs. Alley & Maclellan, of Glasgow. This engine has cylinders 6½in. by 10in. by 8in. stroke, runs at 450 revs. per min., and, by means of a friction clutch, can be coupled to the shaft of a Byng-Hawkins motor generator. This set is shown in Fig. 9. Next to the engine is the motor of the set, being run as such when the main engines are running, and driving the generator on the right, which delivers current at 100 volts. Its capacity is about 200 amperes. At night time, when the main generators are not running, the engine of this set, being coupled up to the motor generator, the motor furnishes current at 500 volts for moving the cars about in the sheds.

There is a 4·75kw. booster connected in on the negative side of the system. This machine runs at 950 revs. per min.

The main switchboard is by the General Electric Co. There are three panels controlling the three feeders, one panel each for the generators and two for the meters and voltmeters. One of the panels controls the auxiliary switchboard seen behind the motor generator plant in Fig. 9. This latter board has two panels, one controlling the motor, the other the generator. The engine-room contains sufficient space for another of the large generating sets, and this additional set is soon to be installed. An overhead travelling crane by Messrs. Carrick & Ritchie, of Edinburgh, spans the width of the engine room.

There are 41 cars in all—viz., 26 short ones and 15 long cars; the latter are shown in Fig. 10. The short cars as well as the long type are single deck. The former seat 26 persons—two outside on the conductor's platform and 24 inside. The long cars are entered into by a side door in the middle of the car length, and seat 46 persons. Of the cars 15 are by the Brush Company, 11 by the General Electric Co. of America, and 15 by the Westinghouse Company. There are the usual two 25 H.P. motors to each car. Some of the cars are mounted on single trucks, and the others on double trucks.

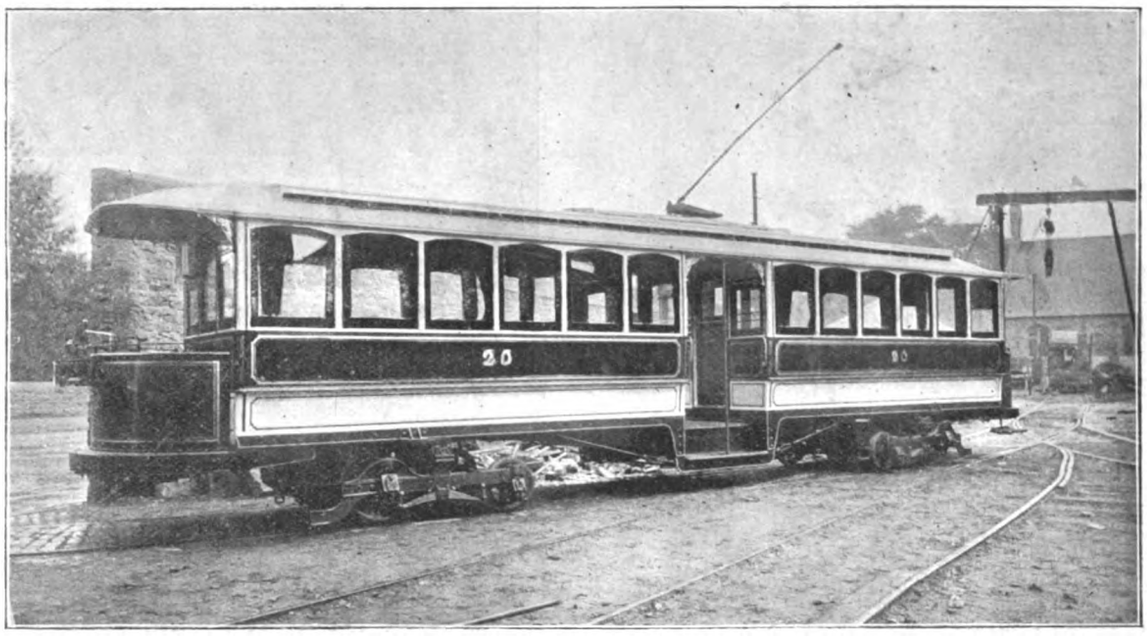

FIG. 10.—SINGLE-DECK BOGIE-CAR FOR 46 PASSENGERS.

In the engine-room are installed at present two large generating sets and one smaller set. The larger engines, which are identical in size, are horizontal, by Ball & Wood, and at 150lb. pressure steam are rated at 350 I.H.P. The cylinders measure 15½in. and 31in. respectively by 16in. stroke. The steam admission to the high-pressure cylinder is governed by a flywheel governor. Directly coupled to each of these engines is a Westinghouse 8-pole railway

No change has been made in the fares charged by the company, and the service is to be one of 5min. on the Morriston section, of 10min. on the Docks and St. Helen's sections, and of 8½min. on the Cwmbwrla section.

Our thanks are due to Mr. F. De Guerrier for furnishing us with information, and for personally conducting us over the works, and to the British Electric Traction Co. for supplying us with some of the photographs illustrating this article.

PROJECTED ELECTRICAL POWER SCHEMES.

(Concluded from page 207.)

6. Shannon Water Power Scheme.—The last of the power bills before Parliament this Session, the preamble of which has just been declared proved by a House of Commons Committee, presided over by Sir F. Godson, is that of the Shannon Water and Electrical Power Co. The promoters are Baron Lurgan and Messrs. V. W. Brown and M. F. Armstrong. The proposed area of supply will be seen by a reference to the accompanying map. Water is to be taken from the River Shannon near the entrance of the Board of Works canal at Errina, and the power-house will be erected at Cloonlara, where a fall of some 40ft. can be obtained. Two years is the estimated period for the completion of this part of the work. To provide compensation water to the river, it is proposed to make arrangements for the lowering of Lough Derg a few feet, but as during some eight or nine months of the year the discharge from the 4,500 sq. miles of drainage area of the River Shannon would probably suffice to generate 20,000 H.P., the lake would only require to be drawn upon for a short period in each year. The estimated cost of the work is some £200,000. The capital of the company is fixed at £300,000, with borrowing powers of £150,000.

A FRICTIONLESS MOTOR METER.*

BY S. EVERSHED.

(*Continued from page 330.*)

Tests for Endurance.—There would be little advantage in any reduction of friction which was either not permanent or obtained at the cost of great delicacy of adjustment, and therefore liable to increase whenever the adjustment was accidentally disturbed. Prolonged trial in actual service is, of course, the only conclusive test of the trustworthiness of any novel apparatus, but the tests to which the frictionless meter is being subjected show already that the mechanism has a remarkable power of endurance. Two meters had been made in 1898, and after many trials with different forms of commutator and train driving apparatus, in the course of which No. 1 meter had made between three and four million revolutions, the elastic commutator was fitted to this meter, and after preliminary tests for friction it was put on to a 100-volt circuit on May 25, 1899, and driven at 80 revs. per min. by means of permanent magnets, placed near the armature, this method of driving being adopted in order to avoid waste of current in the main coils. This

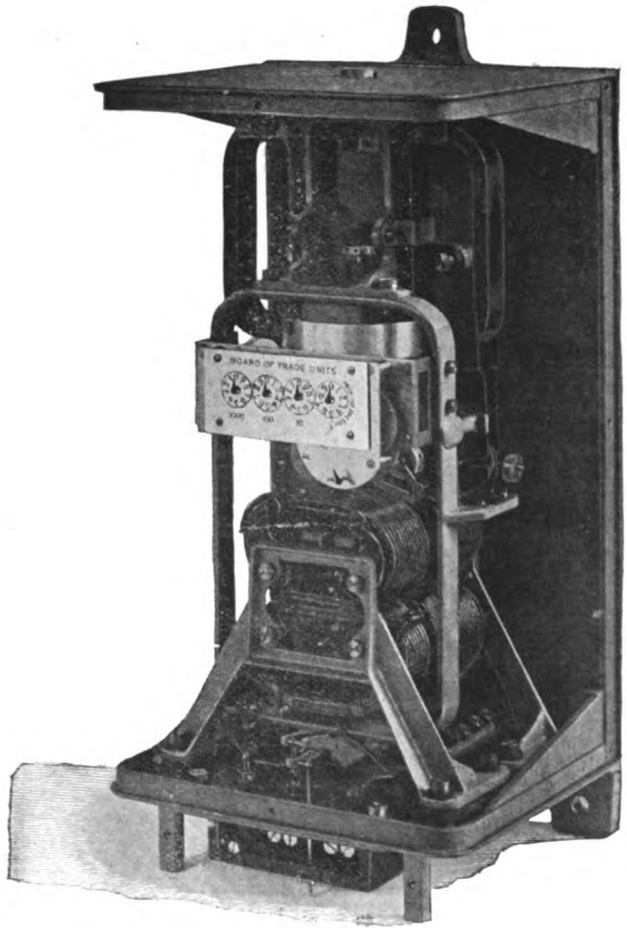

FIG. 13.—View of Evershed Meter. (Case Removed.)

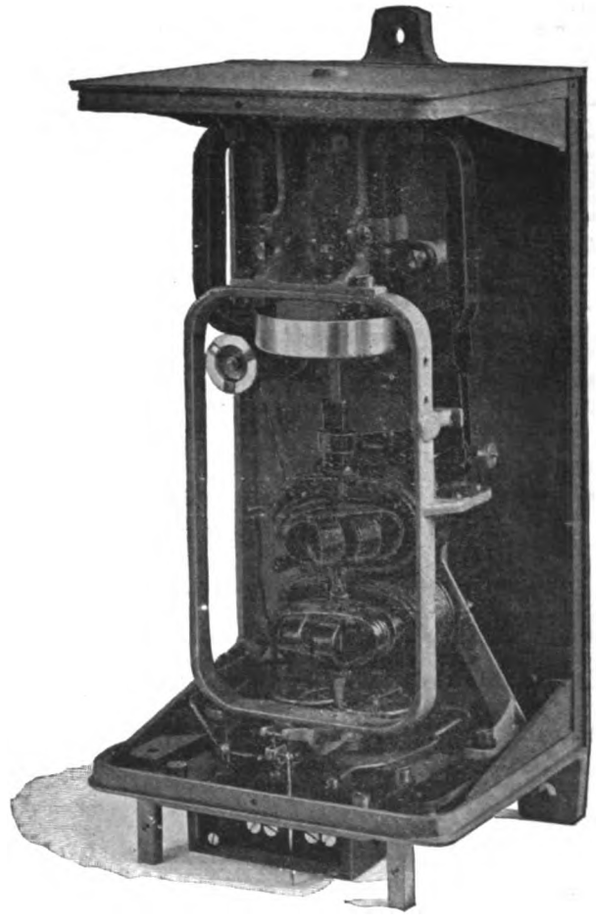

FIG. 14.—View of Evershed Meter. (Front Current Coil Removed.)

meter has been running continuously since that date, with the exception of the few hours occupied in making friction tests. The tests made up to the date of writing are given in Table III. The revolutions are reckoned from the day when the test began, and give the total made by the commutator correctly; but, as already mentioned, the meter had previously run for over 3,000,000 revs., so that the step bearing has been subjected to so much more wear and tear. The standard pressure current is 10 milliamperes, but for the purpose of this test it was raised to 18·2 milliamperes in order to make the energy running down in sparks upon the commutator when the train coils are reversed the same as it is with the standard size of train coil, No. 1 being fitted with a smaller train coil. This increase of current increases the sparking on all the sections, so that the total energy tending to destroy the commutator is far greater than it is with a standard train coil. During the first few weeks some sparking was visible, but this has gradually diminished until at the present time sparks are only seen occasionally. There is no apparent wear either on the commutator wires or on the brush wheels. Platinum in the form of black powder clings to the inside of the wires, and has also settled in a ring round the axle inside the commutator; otherwise there is no visible change. It is possible that the presence of the powder accounts for the diminution of sparking; the energy may be absorbed in heating up the powder, which quite possibly acts as a variable resistance, and so ensures a gradual reduction of the current to zero instead of a sudden interruption and consequent spark. On the other hand the commutator may still be sparking as at first, and the powder may simply prevent the sparks from being seen.

As soon as it was seen that the elastic commuator was a step in the right direction, No. 2 meter was similarly fitted, but with a commutator having much finer wires—about 4mm. diameter—and with brass brush wheels lightly gilt upon their edges. After long tests with different pivots, during which time the elastic commutator made three and a half million revs., No. 2 meter was put on to the 100-volt circuit on October 12, 1899, and it has been running at about 57 revs. per min. day and night since that date. Periodical friction tests have been made, and the results are given in Table IV. No. 2 meter is fitted with a standard train coil, and the pressure current was, therefore, fixed at the normal value—namely, 10 milliamperes. No appreciable wear is visible on the commutator wires, but a curious change has gradually become apparent in the brush wheels. Where they roll in contact with the iridio-platinum wires their edges have acquired a smooth deposit of platinum, and under a magnifying glass they have the characteristic appearance of a surface which has been platinised by the ordinary electro-chemical process.

During these tests no adjustments or alterations of any kind have been made in the meters, nor have any precautions been taken to keep dust and dirt away from them. They are running in a dirty workshop with loose covers over them, and the slowly-increasing friction noticed with No. 2 meter is probably due to the collection of dust—which is very visible—within the step bearing and in the brush-wheel bearings. The normal speed at full load has been fixed at 50 revs. per min., so that No. 2 meter is running 14 per cent. and No. 1 meter 60 per cent. above full speed.

If we assume the average consumer to use the equivalent of 1·8 hours at full load each day, his meter will at the above speed (50 revs. per minute) make 2,000,000 revs. per annum. No. 2 meter has therefore been subjected to wear and tear corresponding to five years' service, while No. 1 meter has run for a period corresponding to

about 14 years. These figures are mentioned in order to enable the value of the tests to be estimated with some sense of proportion; they are not adduced as in any way a substitute for the test of hard work under all the varying conditions necessarily imposed upon supply meters in everyday use.

Possibility of Further Reductions in Friction.—The results so far obtained and an examination of the causes of the remaining friction afford some ground for believing that its limiting value has not yet been reached. The calculated value of the total frictional resistance in Meter No. 2 (see Appendix) is 1·6 dyne cm., 1·1 being attributable to the step bearing and 0·5 to the brush-wheel bearings. It is quite possible to use aluminium wheels and so reduce the pressure on their step bearings to about one-half of the present amount, reducing this part of the friction to 0·25. The pressure of the steel point upon the jewel of the armature axle bearing can be reduced by coupling the train coils back to back, as in Fig. 11, so as to eliminate the effect they now have in alternately increasing and diminishing the induction through the axle and supporting pole. If at the same time some means can be found to prevent the axle from accidentally rising from the step bearing, the only absolutely unavoidable pressure downwards will be about 1 gramme, an amount which is, of course, necessary to prevent the mutual force between the train lever and the train coils from lifting the axle. To err on the safe side, we may assume that it is possible to reduce the pressure from 12 grammes to about 2 grammes, the corresponding reduction in friction being from 1·1 to about 0·2 dyne cm. Hence it seems not impossible to reduce the 1·6 dyne cm. of total calculated friction to 0·45, or say 0·5 dyne cm., a reduction of 1·1. This should be subtracted from the lowest observed value of the frictional resistance in No. 2 meter, and would bring the initial friction in a new meter down to about 1 dyne cm.

Again, the moment of frictional resistance per gramme weight upon the step bearing depends on the acuteness of the steel point resting upon the cup jewel. In the meters hitherto tested no attempt has been made to secure a fine steel point. The point having been ground to an angle of about 30deg., is rounded off at the tip until it forms a hemispherical end of from 5mm. to 7mm. radius. This rests on a sapphire cup of from 20mm. to 40mm. radius, and although two spherical surfaces of different radius ought to touch in a point quite independently of the ratio of their radii, it is obvious that in practice we must look upon our spherical steel point as one with a rough surface making contact with the jewel in a number of points distributed over a very small and approximately circular area, the diameter of which will depend on the ratio of the radii of jewel and point, and upon the smoothness of the two surfaces. Now, as the formula for point friction indicates (see Appendix), the moment of friction is proportional to the diameter of contact, so that we may expect a decrease in moment if we diminish the radius of the spherical point—an expectation which is, of course, borne out by the result of everyday experience. Whether the reduction so brought about will be permanent depends on how far the gradual burnishing of the steel by the jewel is affected by the pressure per unit of contact surface, and on the effect of the burnishing itself upon the co-efficient of friction. No data drawn from engineering experience are likely to afford any clue to the answer to these questions, and no means have hitherto existed for obtaining a direct answer by experiment. The author is now investigating the behaviour of different kinds of step bearings for use in meters with a view to the determination of the type having the greatest power of endurance.

Engineers accustomed to dealing with power in kilowatts and friction measured by hot bearings will be inclined to regard all such discussion of apparently insignificant details as so much industry wasted in the splitting of hairs. It will, however, be agreed that we cannot be said to have solved the problem of metering electric energy until meters possessing an adequate range and accuracy can be so constructed that they may be relied upon for many years' service without need of adjustment or repair.

In this matter we may learn something from the gas meter, of which—in spite of much unmerited and ignorant abuse—it may safely be said that while in point of accuracy it compares not unfavourably with the average electric meter, in other respects it is far in advance of any electric meter at present in use. The value of gas to a consumer depends upon its calorific and illuminating powers, and only in a minor degree upon its pressure. Hence the gas meter may, and does, absorb a large fraction of the available pressure without much disadvantage to the user, and its remarkable power of endurance has been brought about by the use of a motor capable of doing a far larger amount of work than is required to overcome friction, even when the mechanism is much worn by use. A properly made gas meter may be installed upon the consumer's premises and remain there in constant use without adjustment or repair of any kind for from ten to fifteen years before the motor is sufficiently worn to cause a serious error. With an electric supply, on the other hand, energy is what the consumer wants and what he pays for, and for lighting purposes he must have the energy supplied at constant pressure; hence the electric meter cannot be allowed to absorb more than a very small fraction of the energy and pressure of supply. The mechanical power of the electric meter being therefore limited by the conditions of supply, it is only by diminishing friction and wear and tear that we can hope to attain and maintain the required accuracy throughout many years of service. From this point of view it is clearly of the greatest importance that every cause of mechanical friction should be ascertained and as far as possible removed. It was with this conviction that the Author, quite in the early days of public electric supply, set about devising means for diminishing meter friction, and the outcome of a good many years of experimental work is the meter described in this Paper. It is not claimed for it that it is in all respects the ideal of what a meter should be, but the author hopes it may be regarded as a step in the right direction.

NOTE.—The author desires to acknowledge his indebtedness to Mr. Cox, who has the charge of the Experimental Department at Woodfield Works. During three years' continuous work upon the meter Mr. Cox's fertility of resource and inexhaustible patience have surmounted many difficulties and led to numerous improvements. When it was decided to try roller brushes making elastic contact with the commutator, and some trouble was met with in producing rollers of the requisite elasticity, Mr. Cox proposed to have the rollers rigid and make the commutator wires thin enough to provide the necessary elastic rolling contact—an idea which has been adopted with the happiest results.

Electric Automotor Station at Boston, U.S.A.—The *Electrical World* for June 16, gives an illustrated description of a large motor car charging station at Boston, U.S.A. The station belongs to the New England Electric Vehicle Transportation Co., which started work in May, 1899, with three cabs. At the present time there are some 150 vehicles attached to the station, including broughams, hansom cabs, delivery waggons, surreys, stanhopes, runabouts, &c. The charging station is a circular building, about 123ft. in diameter. Power is obtained from the three-wire circuits of the Boston Edison Co., boosters being used to supply the additional E.M.F. The current for each car battery is regulated by means of rheostats. Besides the charging department, there are admirable departments for the inspection, repair and cleaning of vehicles. The capital of this undertaking is one million sterling, which indicates that electric automotor cars are not altogether a failure on the other side of the Atlantic.

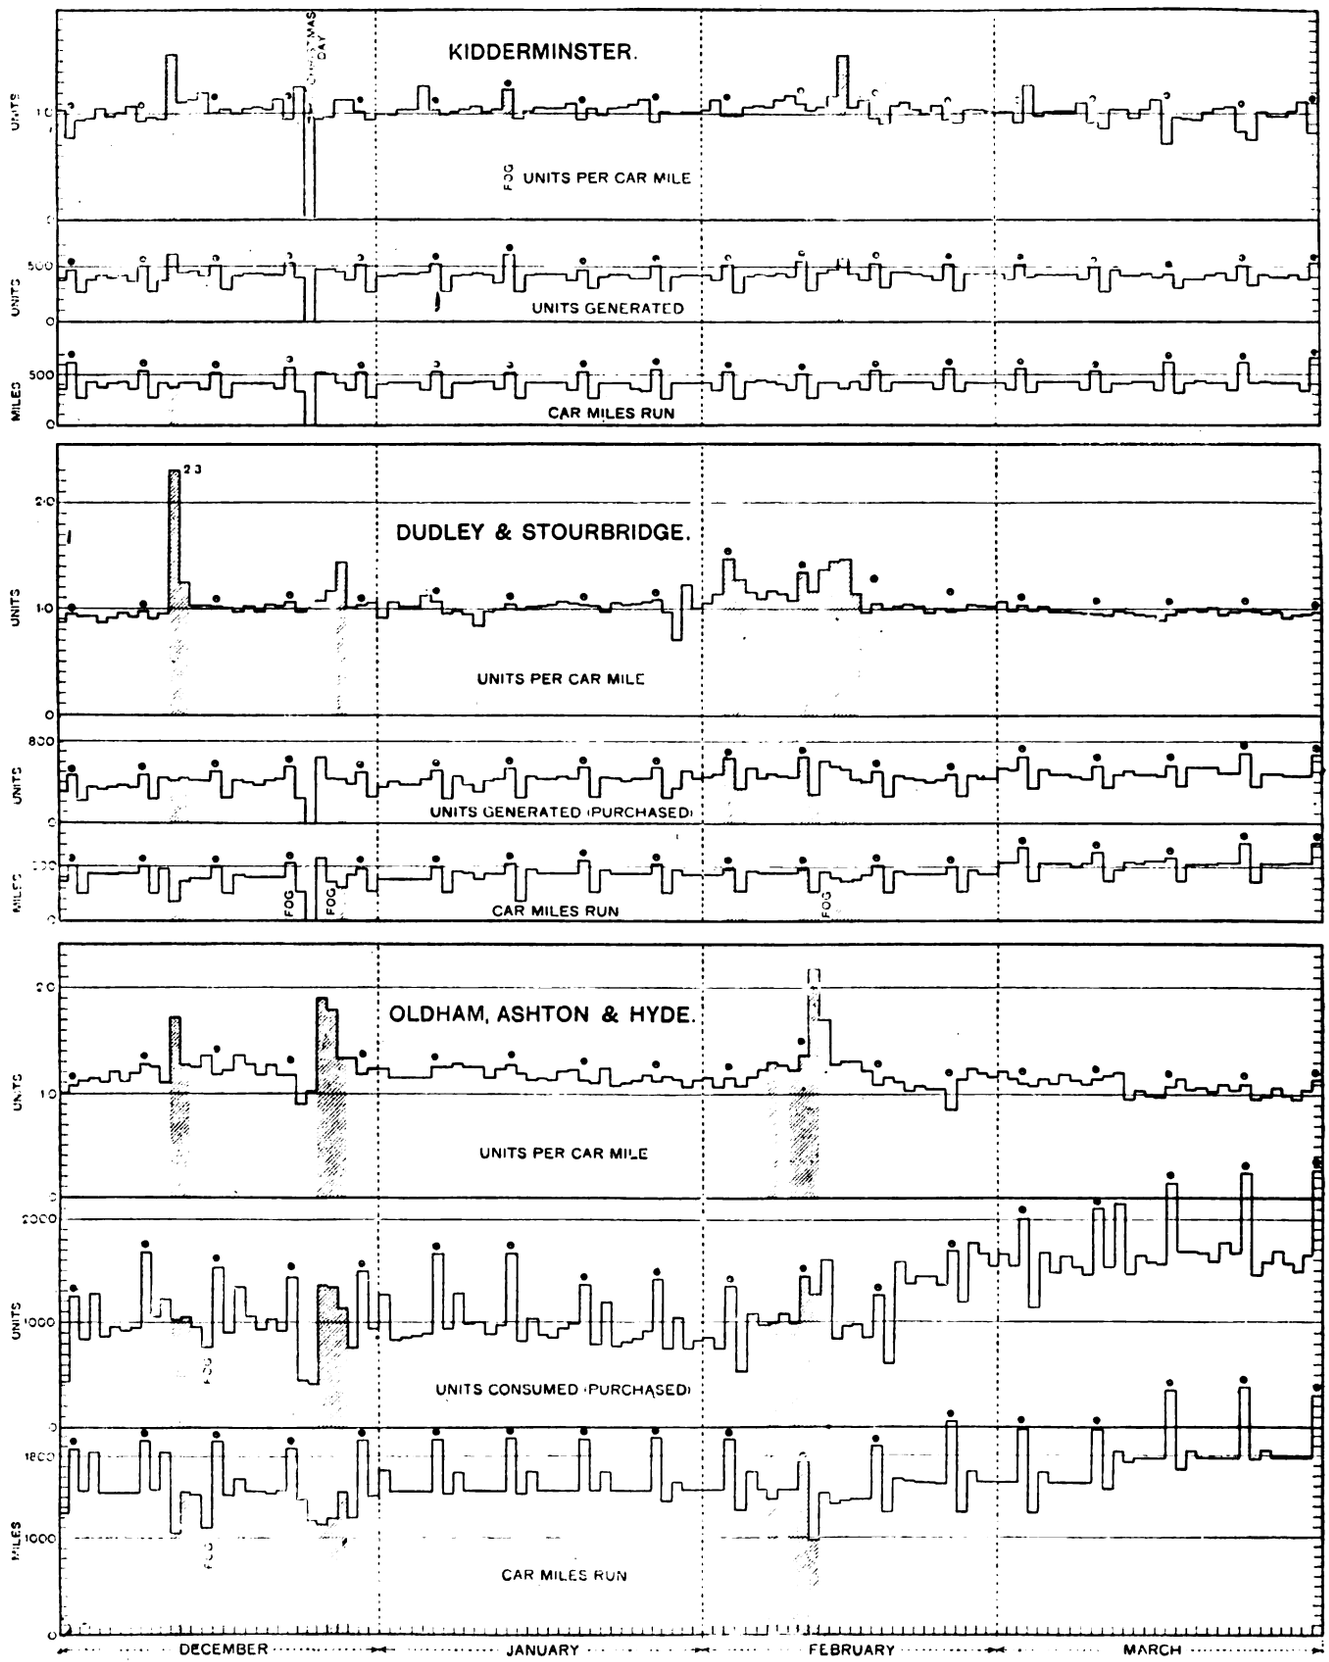
POWER HOUSE DIAGRAMS.

By favour of the British Electric Traction Co., we are able to publish the diagrams below, giving interesting particulars of the running of three electrically-driven tramways for a period of four months from December 1, 1899, to March 31, 1900. They are taken from the power-house records and show the total car miles run on each day during the period named, the total number of units generated for all purposes, and the ratio of the two amounts or the units generated per car mile run, no allowance being made for the units used in the station and only the paying car mileage being given. Mr. H. M. Sayers, the company's power engineer, points out that the smaller consumption per car mile at Kidderminster may be due to the fact that this line is chiefly one of easy gradients and has some fairly free running along a country road-side. The period included in the diagrams contains all the snow-days of the past winter, and the effect of snow is very plainly shown, the increase of the con-



Digitized by Google

sumption per car mile being due to increased resistance of the cars themselves, and also to the snow ploughing, which is not counted as car mileage. Fog is also seen to cause an increase of the current consumption per car mile owing probably to the necessity of ultra-cautious handling of the cars. The effect of the Saturday half-holiday is particularly marked in the Lancashire line, but it is not greatly accentuated in Staffordshire. This is not perhaps so much because Saturday is less of a holiday in Staffordshire as that the service is so fully occupied on all days that Saturdays do not present much of a contrast, though doubtless they will do so when the number of cars available for extra Saturday traffic is increased.

CONTEMPORARY ELECTRICAL SCIENCE.

[Compiled by E. E. Fournier d'Albe.]

Permanent Magnets.—An exhaustive investigation of the various conditions affecting the permanency and the moment of a steel magnet has been carried out by H. Frank. A number of magnets were prepared of the same piece of English silver steel. They were chilled from several high temperatures ranging from a dull red to a white heat, and then magnetised by the same current and coil. The highest magnetic moments were shown by those magnets which had been chilled from a normal read heat, midway between the dull red and the white. The influence of the temperature is very considerable. Thus the moment obtained after heating to normal red is double that obtained after heating to dull red, and 30 per cent. higher than that obtained after heating to a white heat. The duration of the heating, however, seems to have no influence whatever. The temperature at which the magnetisation itself is carried out is also of importance. If carried out at a low temperature, the moment obtained is higher than if the magnetisation takes place at, say, 100deg. But the difference is very slight when the steel has been chilled from a bright red or a white heat. The "loose magnetism" is more easily got rid of when the chilling took place from a low heat than from a high one, and Barus and Strouhal's methods of ageing magnets either by boiling or by cycles of temperature appear to be the best all round.

[H. Frank, *Ann. der Physik*, No. 6, 1900.]

Electrical Transparency of Liquids.—With very simple apparatus, A. de Heen has demonstrated some great inequalities in the transparency of liquids for electric waves. He produced electric waves by attaching a piece of wire gauze to one terminal of an induction coil driven by a Wehnelt interrupter, and let them traverse a set of two concentric test-tubes, the outer one being filled with the liquid to be examined, while the inner one contained a sensitive vacuum tube serving as a wave indicator. It was found that all the liquids examined could be divided pretty sharply into two classes, the transparent ones and the opaque ones respectively. The former include ether, petroleum, benzine, xylene, and butyric and valerianic acids. On the other hand, water, alcohol, aldehyde, carbon bisulphide, and ethyl bromide are opaque to electric waves. This classification shows no connection with other physical properties. For all the liquids are transparent to light, and electrostatic conductivity seems also to be without any determining influence, for water and ether are both conductors, and yet one of them is opaque and the other transparent. A good deal of interest attached to mixtures of an opaque and a transparent liquid. The transparency of ether was reduced from 1232 (in arbitrary units) to 73 by adding 30 per cent. of its volume of alcohol, and to zero by adding 43 per cent.

[A. de Heen, *Comptes Rendus*, May 28, 1900.]

New Sparking Phenomenon.—W. J. Humphreys has noticed that the discharging distance between the poles of an ordinary Toepler machine could be very greatly increased by the aid of small sparks, taken by the hand or otherwise from the negative pole, or from any part of the machine in metallic contact with it; and also that this property is peculiar to the negative side, no such effect being produced by sparks taken from any of the positive parts. The same phenomenon occurs in the case of other types of influence machines, the increase in the sparking distance being often as much as 75 per cent. The poles should be well polished, and condensers should be added to produce the best results. The outside coatings of the jars should be connected with a metallic rod. The phenomenon ceases when the outer coatings of the jars are so insulated that there can be no oscillations or "surges" between them. That the breakdown takes place only when the auxiliary spark is taken from the negative side is explained by the author by supposing that the dielectric is far more sensitive to shocks next the anode than it is next the cathode. For "a spark from either pole will cause an impulsive rush of the opposite charge to the other pole and a consequent rise of its potential." The author does not seem to take into account the ultra-violet light of the auxiliary spark.

[W. J. Humphreys, *Phys. Review*, May—June, 1900.]

Low-Temperature Photometry.—To determine the manner in which the brightness of a luminous body increases with the temperature, O. Lummer and F. Kurlbaum compared the radiation of a "black" hollow space at various temperatures with that of a piece of platinum foil kept at a constant temperature, and reduced the radiations to apparent equality by means of Abney's revolving sector. The relation between brightness and temperature may be expressed by the relation

$$\frac{H_1}{H_2} = \left(\frac{T_1}{T_2}\right)^x,$$

where H is the brightness, T the absolute temperature, and x a coefficient which varies with the temperature. This coefficient has at low temperatures an extraordinarily high value, being 30 at 900deg. abs., 25 at 1,000deg., and 15 at 1,600deg. This circumstance is greatly in favour of photometric measurements of temperature. Differences of colour are fortunately not so fatal as might be expected, owing to the fact that when two adjacent patches of different tints are equal in brightness, the dividing line loses its sharpness. The measurements were made with the help of a Lummer-Brodhun prism. The authors promise to determine x for all available temperatures.

[Lummer and Kurlbaum, *Verhandl. Deutsch. Phys. Ges.* II., No. 8.]

Discontinuity of Cathode Radiation.—The nearest approach yet made to a continuous cathode ray discharge is probably the high-voltage continuous-current discharge described by Trowbridge. He, however, beyond mentioning that he employed several million ohms to eliminate the oscillations, does not bring any direct proof, by the telephone or any other method, to show that the discharge was really continuous. Some experiments recently made by P. Villard go to show that cathode rays have a strong tendency to discharge themselves intermittently, and that they do it, so to speak, on the slightest provocation. He makes a cathode beam rotate about its axis by means of a revolving magnetic field. A continuous beam would then describe a circle on a fluorescent screen. But a cathode beam only produces a series of patches arranged on the circumference of a circle. When the tube is worked by an alternating current, each active semi-period is thus broken up into a series of equidistant discharges. The discharge of an influence machine is similarly broken up, and Birkeland has shown that the same rule applies to the discharge of an induction coil.

[P. Villard, *Comptes Rendus*, June 25, 1900.]

Telegraphone.—The instrument described under this name by W. Poulsen is intended to record any sound or spoken word at a distance. Instead of a telephone receiver an electromagnet is inserted in the telephone circuit, and between its poles a steel wire or band is drawn along at a uniform rate. The variations in the current produce variations of the magnetic field, and hence also of the transverse magnetisation of the band. On passing the wire or band between the poles of the same electromagnet, and inserting a telephone receiver into the circuit, the original sound is reproduced. The band can be rendered available for renewed service by sending a continuous current through the electromagnet, and passing

Digitized by Google

the band through. Several simultaneous messages can be recorded on the same band and read without confusion. Each message is recorded by two independent electromagnets, one of which can be subsequently reversed, so that it opposes the other, and produces silence. The second message can then be read independently, with its two electromagnets in series.

[W. POULSEN, *Comptes Rendus*, June 25, 1900.]

Photographic Effects from Radiating Wires.—The mast wire used in "wireless" telegraphy is known to give out a slight rustling noise when in action. T. Tommasina has followed up this observation by inserting a short length of thin wire enclosed in a light-tight box in the mast wire, and has observed luminous brushes, which he has also photographed. The brushes vibrate in unison, not with the oscillator, but with the interrupter of the induction coil. When both are in unison the brushes are distributed at regular intervals along the wire. They can be photographed by placing the sensitive plate in immediate contact with the wire. It then appears that the brushes form straight lines normal to the wire. When the sensitive plate is laid face downwards, and held down by a wooden block, there is a minimum of brushes under the middle of the block and two maxima at the ends. Under an iron block the minimum is not so pronounced, but there is a distinct convergence of the brushes towards the middle, as there is in the magnetic lines of force of a bar magnet. The finer the wire the smaller are the brushes and the closer together they are. The author concludes from these observations that the electric energy radiated by the wire, and partly converted into these brushes, is propagated from the individual molecules in planes at right angles to the wire.

[T. TOMMASINA, *Comptes Rendus*, May 28, 1900.]

ELECTRICITY WORKS ACCOUNTS.

Kingston-upon-Hull Municipal Electric Supply Works.

From our summary of the Hull accounts for the year ended at March 31st last it will be seen that, in so far as the financial results of the year's operations are concerned, there was an unfortunate falling off from the position of the previous year.

On the other hand, the progress made in the acquisition of new business showed a marked improvement. During the year the additional lamps connected raised the total equivalent lamp connection to 79,376 8 c.p. lamps, or nearly 31 per cent. The output, at 940,192 units sold, marked an advance of over 25 per cent. on the corresponding quantity in 1898-9. Unfortunately, there was a material falling off in the load factor from 7·96 per cent. to 7·64 per cent. These are low figures, and to them no doubt is attributable, to a great extent, the somewhat high cost figures in relation to the output.

With the exception of the repairs item, all the generating costs have risen. The fuel item is the chief offender, and although a rise to some extent in this department has been inevitable, yet the advance of nearly 0·22d. per unit, or 33 per cent., seems rather abnormal, especially for a town situated as Hull is. In spite, however, of the increases the other items are, we must say, satisfactory, and the total costs present a figure by no means above the average under similar conditions of output and load factor.

The diminution in the revenue, the increased capital and working expenditure have naturally had their effect on the working profit, and it has fallen from 10·9 per cent. to 7·57 per cent. The large additions to the lamp connections show that the sacrifice of revenue has not been made in vain, and we hope the reward will be in evidence in the current year's accounts.

The Scarborough Electric Supply Co. (Ltd.).

The results of the Scarborough company's operations during last year are, on the whole, satisfactory. The increase in the output, while nothing like as great as in the preceding year, was above the average. The load factor, however, which was 9·05 per cent. in 1898 has fallen to 8·65 per cent. During the year 82 new consumers were acquired and the lamp connections were increased by the equivalent of 4,827, or nearly 22 per cent. Among the generating costs the fuel and repairs items have materially increased, but they are by no means abnormal in the circumstances. The management and property charges show a very reasonable figure which, in combination with the moderate works costs of 2·59d. per unit, results in the aggregate costs being sensibly below the average at similar outputs.

It should be gratifying to the company that, in spite of the increased price of fuel, the working profit has been so well maintained. After an allocation of £472 to the depreciation fund and with the balance of £368 from the preceding year and £80 premiums on shares, the amount available for distribution was £2,576, out of which an ordinary dividend of 6 per cent. was paid.

It can hardly be said that this company's depreciation fund has been very liberally dealt with. It is only during the last three years that any allocation has been made at all, and the balance to the credit of the fund is but £1,400, although during the last four years the dividend has risen steadily from 4½ per cent. to 6 per cent.

We reproduce the following figures for comparison:—

Year.	No. of consumers.	Equiv. lamp con.	Output (units sold).	Max. supply demanded Kw.	Plant capacity. Kw.	Total costs per unit.	Gross profit. Total.	Gross profit. % to mean cap.
1894	183	10,480	86,594	150	300	...	...	...
1895	235	12,788	135,177	215	525	4·39d.	£993	3·19
1896	298	17,727	174,514	246	525	3·80d.	£1,603	4·93
1897	330	20,067	211,407	286	525	3·53d.	£2,021	5·83
1898	383	22,344	217,251	274	675	3·43d.	£2,296	6·07
1899	465	27,171	257,412	340	675	3·33d.	£2,634	6·22

The following is a list of electric supply works the accounts of which have been analysed, together with the dates on which statements and analyses of accounts have appeared:—

Aberdeen (Municipal)	Jan. 12, 1900	Kingston-on-Thames (Mun.)	April 21, 1899

The Electrician.

The Oldest Electrical Journal (established as a weekly Journal 1861—1878

Published every Friday, Price Sixpence; Post Free, Sixpence-Halfpenny.
Editorial Publishing and Printing Offices,

1, 2 & 3, SALISBURY COURT, FLEET ST., LONDON.

Telephone: 949 Holborn. *Telegrams:* "ELECTRICIAN NEWSPAPER LONDON."

All Letters relating to Subscriptions, Advertisements, and other business matters should be addressed to the Publisher "THE ELECTRICIAN," *Salisbury-court, Fleet-street, London, E.C. Cheques and Money Orders should be made payable to* "THE ELECTRICIAN" *Printing and Publishing Company, Limited, and be crossed "Coutts and Co."*

All Editorial letters to be addressed to THE EDITOR.

All letters for insertion in "THE ELECTRICIAN," *or containing questions, must be accompanied by the name and address of the writer as evidence of good faith. No notice whatever is taken of anonymous communications.*

"THE ELECTRICIAN" *is published every Friday morning, in time for the morning mails. It is on sale at the railway bookstalls throughout the Kingdom on Friday morning, and can be obtained of all Booksellers and Newsvendors; or direct from the Publishing Offices, as above*

Subscription Rates.—The Rates for Subscriptions to "THE ELECTRICIAN" are as under:—

	Year	Half-Year	Quarter	
United Kingdom	26s. 0d.	13s. 6d.	7s. 0d.	Post free, payable in advance.
Postal Union	30s. 0d.	16s. 0d.	8s. 0d.	

New Volumes of "THE ELECTRICIAN" *commence in April and October.*

"THE ELECTRICIAN" *offers exceptional advantages to Advertisers.* **It has by far the largest circulation of any English Electrical paper, and circulates all over the World.** *This statement is guaranteed.*

Advertisement Rates, &c., forwarded on application to the Publisher.

TRADE ADVERTISEMENTS *intended for the current issue must reach the Office not later than First Post on Thursday. Renewals of expiring advertisement orders and alterations to standing advertisements must be in Publisher's hands by Wednesday. Wrapper Advertisements by Wednesday morning.*

OFFICIAL ANNOUNCEMENTS, AUCTIONS, *and* SMALL ADVERTISEMENTS *accepted up to* **6** *p.m. on Thursday.*

ELECTRICAL BOOKS AND PUBLICATIONS.

All Books, Newspapers, and other publications can be ordered direct of THE ELECTRICIAN" *Printing and Publishing Company, Limited. The well-known* "ELECTRICIAN" SERIES *of Standard Electrical Works at present consists of—*

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. ELTON YOUNG, M.I.E.E. Price 10s. 6d., post free; abroad 11s.

THE STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By Messrs. H. K. C. FISHER and J. C. H. DARBY. Price 6s. net; abroad, 6s. 3d.

BIBLIOGRAPHY OF X-RAY LITERATURE AND RESEARCH. Edited by C. E. S. PHILLIPS. With an introduction on the history of Crookes Tube and Röntgen Ray work, and a chapter giving "Practical Hints" on the subject.

THE POTENTIOMETER AND ITS ADJUNCTS. By W. C. FISHER. Price 6s., post free.

LOCALISATION OF FAULTS IN ELECTRIC LIGHT MAINS. By F. C. RAPHAEL. Price 5s., post free.

MOTIVE POWER AND GEARING. By E. TREMLETT CARTER. Price 12s. 6d., post free.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. WILKINSON. Price 12s. 6d., post free.

ELECTRICAL LABORATORY NOTES AND FORMS (Elementary and Advanced). Arranged by Dr. J. A. FLEMING, M.A., F.R.S. Printed particulars on application.

ELECTROMAGNETIC THEORY. By OLIVER HEAVISIDE. Vol. I. Price 12s. 6d., post free 13s. Vol. II. Price 12s. 6d.; post free, 13s.

THE ALTERNATE CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Dr. J. A. FLEMING. VOL. I.—THE INDUCTION OF ELECTRIC CURRENTS. NEW EDITION. Price 12s. 6d., post free. VOL. II:—THE UTILISATION OF INDUCED CURRENTS. Price 12s. 6d., post free.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. FLEMING, M.A., D.Sc., F.R.S. New Edition. 93 original illustrations, price 6s

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. EWING, M.A. New edition. Price 10s. 6d., post free.

ELECTRIC MOTIVE POWER. By A. T. SNELL. 10s. 6d. post free.

THE ART OF ELECTROLYTIC SEPARATION OF METALS (Theoretical and Practical). By Dr. GEORGE GORE. Price 10s. 6d., post free.

ELECTRO-CHEMISTRY. By Dr. GEORGE GORE. Price 2s., post free.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. KENNELLY and H. D. WILKINSON. Price 6s. 6d., post free.

DRUM ARMATURES AND COMMUTATORS (Theory and Practice). By F. M. WEYMOUTH. Price 7s. 6d. post free.

THE INCANDESCENT LAMP AND ITS MANUFACTURE. By GILBERT S. RAM. Price 7s. 6d., post free.

POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. GEIPEL and H. M. KILGOUR. Price 7s. 6d. net, post free 7s. 9d., abroad 8s.; large-paper edition, 12s. 6d., post free. New edition in the press.

"THE ELECTRICIAN" PRIMERS. In Two Vols. Paper covers, 2s., post free 2s. 2d. each; strong cloth 2s. 6d., post free 2s. 9d. each. Single Primers 2d., post free 2½d.

WIRELESS TELEGRAPHY: SIGNALLING ACROSS SPACE WITHOUT WIRES BY ELECTRIC WAVES. By Dr. O. J. LODGE. New Edition. Price 5s. net.

A DIGEST OF THE LAW OF ELECTRIC LIGHTING, ELECTRIC TRACTION, TELEGRAPHS, TELEPHONES, &c. A. C. CURTIS-HAYWARD, B.A. To January, 1900. Price 3s. 6d., post free.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By FRANCIS JEHL. Price 10s. 6d., post free.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. A Practical Guide to the Establishment of a Carbon Manufactory. Price 1s. 6d., post free.

THE STEAM ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. BEAUMONT. Price 3s. 6d., post free.

FULL CATALOGUE POST FREE ON APPLICATION.

"ELECTRICIAN" SERIES FORTHCOMING BOOKS.

THE ELECTRIC ARC.—By Mrs. AYRTON. This work is in the press, and will contain an historical sketch of the early experiments on the electric arc, as well as the important results of recent research.

PRIMARY BATTERIES.—A work on this subject will shortly be published bringing the theory and practice of the Primary Battery up to date. The book will be fully illustrated.

SECONDARY BATTERIES.—By E. J. WADE. Fully illustrated. The Author in this work will deal briefly with the theory and fully with the chemistry, design, construction and manufacture of secondary batteries or accumulators.

"THE ELECTRICIAN" WIREMAN'S POCKET-BOOK.—Edited by F. C. RAPHAEL. "The Electrician" Company will shortly publish a valuable pocket-book for the use of those engaged in wiring work, both external and internal.

THE TELEPHONE.—By DANE SINCLAIR and F. C. RAPHAEL.

SPECIAL NOTICES.

NOW READY.—Vol. XLIV. of "THE ELECTRICIAN" (950 pages), bound in strong cloth. Price 17s. 6d., post free 18s. 6d. Also ready, Cases for binding. Price 2s., by post 2s. 3d.

A complete set of "THE ELECTRICIAN" (1878-1900) can now be supplied. These sets are very scarce, and early application should be made.

NOW READY.—"THE ELECTRICIAN" READING CASE. Holds four copies of the Journal. Corded for hanging. Price 1s.; post free, 1s. 4d.

ELECTRICITY WORKS FOR SMALL TOWNS.

A number of questions of considerable interest to electrical engineers are raised in the two Papers on electricity works for small towns, read at the recent meeting of the Municipal Electrical Association, and in the discussion which ensued. These Papers, by Mr. C. S. VESEY BROWN, of Lincoln, and Mr. G. M. HARRIS, of Bray, respectively, have already appeared in our columns, and an abstract of the discussion is printed in this week's issue. Mr. BROWN'S Paper treats the question purely from the standpoint of erecting a separate works for each small town, whereas Mr. HARRIS, though recognising some advantages in a separate station, is also willing to concede that many of the smaller towns will have to depend upon their being included in the very much greater area of large power schemes. Indeed, one almost hears the dying wail of the small electricity works echoed in the following words from from Mr. HARRIS'S Paper: "Where there are no such advantages there appears to be no alternative but to wait for the great power companies to pick up such small areas as may be within their reach, or upon the direct line of route of their mains to larger ones." At this time of the day it would probably be better for small towns to wait until they are thus absorbed into the supply systems of large power distribution schemes than to expend a large capital in developing electricity works of their own. We trust and believe they will not have long to wait.

It is this difficulty of placing small electricity works upon a satisfactory self-supporting basis which is at the root of the controversy these two Papers started, as to whether the owners of such small works should engage an outside consulting engineer, or place the design of the works and all future extensions in the hands of their resident engineer. Mr. VESEY BROWN'S suggestion to small local authorities is, that "they should employ a competent expert to advise and initiate a policy and system, and for the first stage of the undertaking pay him the usual fees; that then they should engage a resident manager, whose duties would be to manage both

Digitized by Google

commercially and technically the whole undertaking, and that as extensions are required, the consulting expert should be called in to advise, he being paid an annual retainer to cover the advice given." Several speakers, however, took exception to this proposal, though, on the other hand, many supported it. The view of the opponents seemed to be that if a man is competent to run works he must necessarily be competent to design and superintend the carrying out of their extensions. This, however, is by no means the case. There are many first-rate marine engineers perfectly competent to run an ocean liner, but who would be absolutely unable to design the engine room of a steamship. The same applies to central station engineers and especially to those whose experience is limited to small undertakings. Moreover, a central station engineer is apt to repeat his experience in his extensions; whereas an outside consulting engineer is likely to introduce more modern ideas, and thus enable the works to keep pace with the progress of engineering. One, in fact, tends to crystallise the works into the original pattern from which he obtained his largest experience, the other has every inducement to bring extensions up to date. We are quite aware that these remarks do not apply to the resident engineers of really large works, who are from the nature of their daily engagements thoroughly competent not only to carry on extensive works of the most modern design, but are capable of advising their employers as to important extensions. The salaries which are paid to these men, however, can never be paid by the local authorities of small towns, who must be content with offering a remuneration that will capture, doubtless serviceable, but by no means first-rate men. In these circumstances, therefore, it is the wisest policy of the smaller local authority—if a local electricity works must indeed be erected—to place the design of the entire system in the hands of a competent outside expert. These same considerations, but slightly modified, point to the advisability of adopting the same practice whenever small works require extension. We are, therefore, in full accord with Mr. Vesey Brown in his suggestion on this subject.

Mr. J. E. Edgcome, of Kingston-on-Thames, suggested in the discussion that it would be an admirable office for the Municipal Electrical Association to undertake if it were to offer to supply the names of competent engineers, who could advise small local authorities as to the erection or extension of electricity works. We presume that it is Mr. Edgcome's intention that the Association should nominate some of the more prominent municipal resident engineers, whose experience in larger towns would enable them to carry out the work of equipping small towns properly. If such a suggestion were to be carried out seriously, it would present a combination in formidable competition with the independent non-municipal consulting engineer. We doubt very much, however, whether local authorities would, to any great extent, prefer to consult the Council of the Municipal Electrical Association rather than to place their work directly in the hands of an independent consulting engineer on the strength of his public reputation. Moreover, remembering that every member of the Council of the Association aspires to a consulting practice, it would be curious to know how the Council would proceed to nominate their man. Would it be by ballot, or on the principle of turn and turn about, or would the President for the year have a right of veto? In any case, we do not think the local authority would always be best served by such a plan as Mr. Edgcome suggests. Independent private action is, in the ranks of consulting engineers, the most satisfactory course for both consultants and clients.

ELECTROMAGNETIC THEORY.—CXVI.*

BY OLIVER HEAVISIDE.

(*Continued from p. 247.*)

§ 466. In consequence of the circuitality of the currents, electric and magnetic respectively, all states of induction and displacement which are due to impressed electric and magnetic force depend solely upon the curl of e or of h. This was shown in Vol. I., § 87. Now, intrinsically electrised and magnetised bodies are brought into the theory by what are equivalent to e and h. The disturbances produced by moving such bodies therefore involve the consideration of the waves emitted from the seat of the curl of e or h. It is also true that the static states themselves may be regarded as arising from the superimposition of waves continuously emitted by the sources mentioned. But this is useless, though curious. On the other hand, when e and h vary in intensity, either in time or in place, or in both, the consideration of the waves in question is imperative. In Vol. I., § 89, was described generally the nature of the waves from a circular source; and above have been investigated several cases of moving magnets, &c., under such circumstances as give rise to simple plane waves. The results are sometimes rather incredible, but that soon wears off. The human mind is so made as to be capable of believing anything, no matter how silly, provided it is imprinted heavily enough. That is well known to all astute people—to those priests in particular who convert men and women into sheep by saying the same thing over and over again. In the end they have no judgment left. The incredibility of results is no evidence by itself of necessary error. The reasoning man may not believe till he sees it: that does not imply disbelief, but a reserved attitude, waiting for more light.

The electromagnetic wave from a straight line source when stationary I have considered before, *El – Pa.*, Vol. II., p. 456. It is wanted here, as a foundation for the theory of the same when moving; so for completeness I give what is necessary, in a somewhat different way, and with an addition. Let there be a straight line source of f or curl e. It generates induction at the rate f per second. That is how the wave originates. For the induction spreads all round at speed v, and along with it is electric force, according to the circuital laws. But it is not so simple a matter in the present case as with a plane source of f, already considered. There is a mixing up in the cylindrical wave.

By symmetry H is uniformly distributed round about the axis which is the straight line of f, so that the general characteristic $\nabla^2\mathrm{H} = q^2\mathrm{H}$, where $q = p/v = d/d(vt)$, reduces to the zeroth Bessel form

$$\left(\frac{d^2}{dr^2} + \frac{1}{r}\frac{d}{dr}\right)\mathrm{H} = q^2\mathrm{H}, \tag{1}$$

where H is the intensity of magnetic force at distance r from the axis.

The appropriate solution is

$$\mathrm{H} = \mathrm{K}_0(qr).\ \mathrm{A}, \tag{2}$$

where A is a time function to be found to suit f given as a function of the time. To find A, note that the second circuital law

$$-\operatorname{curl}(\mathbf{E} - \mathbf{e}) = \mu p\mathrm{H} \tag{3}$$

takes the special form

$$\frac{1}{r}\frac{d}{dr}(r\mathrm{E}) = f - \mu p\mathrm{H}. \tag{4}$$

This is proved at once by considering two adjacent circles of E. In this equation f is the density of curl e. But let all the f be concentrated at the axis to make a line source, of strength f_0, say, and then integrate (4) over a circle of infinitesimal area centred upon f_0. The integral of μpH vanishes, whilst that of f is f_0. This is the same as saying that the circuitation of E round f_0 tends to the value f_0 as r is reduced to 0. That is,

$$2\pi r\mathrm{E} = f_0, \qquad \text{when } r = 0. \tag{5}$$

* All rights are reserved.

Digitized by Google

But the first circuital law

$$\text{curl } \mathbf{H} = cp\mathbf{E},$$

reduces to

$$-\frac{d\mathrm{H}}{dr} = cp\mathrm{E}; \tag{6}$$

so, by (2) and (6), used in (5), we get

$$f_0 = -\frac{2\pi r}{cp}\frac{d}{dr}\mathrm{K}_0(qr)\mathrm{A} = -\frac{2\pi r}{cp}\frac{d}{dr}\left(-\frac{2}{\pi}\log\frac{qr}{2}\right) = \frac{4}{cp}\mathrm{A}. \tag{7}$$

See Vol. II., p. 226, equation (4), or p. 250, equation (48), for the full formula for $\mathrm{K}_0(qr)$, of which the only significant part at the axis is the log term here employed. So $\mathrm{A} = \frac{1}{4}cpf_0$, and therefore

$$\mathrm{H} = \tfrac{1}{4}cp\mathrm{K}_0(qr)f_0 = \frac{1}{4\mu v}\mathrm{K}_0(qr)q\,f_0 \tag{8}$$

is the operational solution for H, true for any varying f_0.

Let f_0 be steady, beginning at the moment $t=0$. The algebrisation was given in Vol. II., § 436, p. 456, equation (119) equivalently. But interchange r and vt in that investigation to suit the present case. The result is

$$\mathrm{H} = \frac{f_0}{2\pi\mu r(v^2t^2 - r^2)^{\frac{1}{2}}}, \tag{9}$$

and the corresponding E is

$$\mathrm{E} = -\frac{1}{cp}\frac{d\mathrm{H}}{dr} = \frac{vtf_0}{2\pi r(v^2t^2 - r^2)^{\frac{1}{2}}} \tag{10}$$

These are valid between the axis and the wave front at $r = vt$, beyond which E and H are zero. At the axis H varies as t^{-1}. If the value of H at the axis had been known the above investigation would have been unnecessary, because H at r is derivable from H_0 at the axis by

$$\mathrm{H} = \mathrm{I}_0(qr)\,\mathrm{H}_0 = \mathrm{I}_0(qr)\frac{cf_0}{2\pi t}, \tag{11}$$

which produces the formula (9). Compare with equation 118(e), §436, Vol. II., in which Δ and q, r and vt should be interchanged.

In the above the divergent K_0 function was employed to effect the algebrisation. But we may obtain the same result by the convergent Bessel function. Thus,

$$\mathrm{I}_n(qr)q\mathrm{1} = \frac{(\frac{1}{2}qr)^n q}{0\lfloor n} + \frac{(\frac{1}{2}qr)^{n+2}q}{1\lfloor n+1} + \ldots \tag{12}$$

$$= \frac{1}{vt}\left\{\frac{(r/2vt)^n}{\lfloor 0 \lfloor n \lfloor -(n+1)} + \frac{(r/2vt)^{n+2}}{\lfloor 1 \lfloor n+1 \lfloor -(n+3)} + \ldots\right\}, \tag{13}$$

the transition from (12) to (13) being made by turning $p^n\mathrm{1}$ to $t^{-n}/\lfloor -n$, according to the theory given in Vol. II., with numerous examples. Now

$$\mathrm{K}_0(qr) = -\frac{2}{\pi}\frac{d}{dn}\mathrm{I}_n(qr), \quad (n=0). \tag{14}$$

This applied to (13) makes

$$\mathrm{K}_0(qr)q\mathrm{1} = \frac{1}{vt}\frac{2}{\pi}\left\{g'(-1) + \frac{(r/2vt)^2 g'(-3)}{\lfloor 1 \lfloor 1} + \frac{(r/2vt)^4 g'(-5)}{\lfloor 2 \lfloor 2} + \ldots\right\} \tag{15}$$

$$= \frac{2}{\pi vt}\left\{1 + \tfrac{1}{2}\left(\frac{r}{vt}\right)^2 + \frac{1.3}{2.4}\left(\frac{r}{vt}\right)^4 + \ldots\right\} \tag{16}$$

$$= \frac{2}{\pi}\frac{1}{(v^2t^2 - r^2)^{\frac{1}{2}}}. \tag{17}$$

This corroborates equation (9). For the values of the g' functions used see Vol. II., p. 451, equations (78).

Being in the way of it, it is worth while giving the corresponding results when the medium is a conductor instead of a non-conductor, and its permittivity is ignorable. The operator cp in the first circuital law becomes k, the conductivity. This makes $q^2 = \mu kp$. Therefore

$$\mathrm{H} = \tfrac{1}{4}k\mathrm{K}_0(qr)f_0 \tag{18}$$

is the operational solution, instead of (8). To algebrise, proceed thus.

$$\mathrm{I}_n(qr)\mathrm{1} = \frac{(\frac{1}{4}\mu kpr^2)^{\frac{1}{2}n}}{\lfloor 0 \lfloor n} + \frac{(\frac{1}{4}\mu kpr^2)^{\frac{1}{2}n+1}}{\lfloor 1 \lfloor n+1} + \ldots$$

$$= \frac{(\mu kr^2/4t)^{\frac{1}{2}n}}{\lfloor 0 \lfloor n \lfloor -\frac{1}{2}n} + \frac{(\mu kr^2/4t)^{\frac{1}{2}n+1}}{\lfloor 1 \lfloor n+1 \lfloor -(\frac{1}{2}n+1)} + \ldots \tag{19}$$

To this apply (14), giving

$$\mathrm{K}_0(qr)\mathrm{1} = -\frac{2}{\pi}\left\{\log \mathrm{Z}^{\frac{1}{2}} + g'(0) - \tfrac{1}{2}g'(0) - \tfrac{1}{2}\mathrm{Z}g'(-1) - \tfrac{1}{2}\mathrm{Z}^2\frac{g'(-2)}{\lfloor 2 \lfloor 2} - \tfrac{1}{2}\mathrm{Z}^3\frac{g'(-3)}{\lfloor 3 \lfloor 3} - \ldots\right\}$$

$$= -\frac{1}{\pi}\left\{\log \mathrm{Z} + \gamma - \mathrm{Z} + \frac{\mathrm{Z}^2}{2\,2} - \frac{\mathrm{Z}^3}{3\,3} + \ldots\right\}, \tag{20}$$

where $\mathrm{Z} = \mu kr^2/4t$, and $\gamma = g'(0) = 0{\cdot}5772$. Therefore

$$\mathrm{H} = -\frac{kf_0}{4\pi}\left\{\log \mathrm{Z} + \gamma - \mathrm{Z} + \frac{\mathrm{Z}^2}{2\,2} - \frac{\mathrm{Z}^3}{3\,3} + \ldots\right\} \tag{21}$$

expresses H at r at time t due to the source f_0 at the axis beginning at $t=0$. The series is convergent, and is therefore suitable when Z is not large. To suit larger values of Z we may turn (21) to a divergent series. Use equation (93), p. 452, Vol. II. It produces

$$\mathrm{H} = \frac{kf_0}{4\pi\mathrm{Z}}\epsilon^{-\mathrm{Z}}\left\{1 - \frac{1}{\mathrm{Z}} + \frac{2}{\mathrm{Z}^2} - \frac{3}{\mathrm{Z}^3} + \ldots\right\}, \tag{22}$$

which is proper when Z is too large for the practical use of (21). It is curious to see that the series following $\epsilon^{-\mathrm{Z}}$ is that series itself with every term turned upside down. It is also curious to see that we cannot get away from the divergent series, either operationally or numerically. They seem to have come to stay, like other things before.

If f_0 is impulsive, we get the corresponding H by time-differentiation. Let the impulse be B_0, then we put $p\mathrm{B}_0$ for f_0 in (18). This makes

$$\mathrm{H} = \tfrac{1}{4}k\mathrm{K}_0(qr)p\mathrm{B}_0 = \frac{k\mathrm{B}_0}{4\pi t}\epsilon^{-\mathrm{Z}}, \tag{23}$$

by differentiating (21). This, observe, or test to corroborate, is the same as

$$\mathrm{H} = \mathrm{I}_0(qr)\frac{k\mathrm{B}_0}{4\pi t}, \tag{24}$$

where the operand is the value of H at the axis. But if you try to turn (23) to a divergent series by differentiating (22), you will come to the convergent solution (23) again.

Observe that (23) is the same as

$$2\pi r(\mathrm{B} = \mu\mathrm{H}) = -\mathrm{B}_0\frac{d}{dr}\epsilon^{-\mathrm{Z}}. \tag{25}$$

It follows that the total B over all space is B_0, constant. This is because we impulsively generate B_0, and it then simply diffuses outwards, but cannot be destroyed by the electric conductivity of the medium. It requires magnetic conductivity to destroy it. See Vol. I., §§ 194, 195.

Similarly, in case of the continued source f_0, the total B at time t amounts of f_0t. We must integrate over all space to find it, because in pure diffusion the speed v is infinite. On the other hand, in the nonconducting dielectric, the induction to the amount f_0t is to be found always between $r=0$ and vt. An easy integration of (10) will show that the induction between $r=0$ and mvt, where m is any fraction, is proportional to f_0t. Here the radius of the circle considered is always a constant fraction of the radius of the wave front. But within any circle of constant radius, the total induction falls to zero because B tends to zero, everywhere save at the wave front, where it is always infinite. This infinity, however, is of no consequence, being empty.

The electric field tended to is specified by

$$\mathrm{E} = \frac{f_0}{2\pi r}. \tag{26}$$

It is the electric field due to an electric shell of strength f_0 having a single straight edge at the axis, and therefore extending to an infinite distance. But if it is stopped by another straight edge parallel to the first at any distance, a second source is introduced, which is the negative of the first. There are then two waves produced, according to the above formulæ. The total induction (algebraically reckoned) is now always zero; although before the waves overlap the steady generation at a rate of +B by one source and −B by the other, and their existence in separate regions is evident.

Digitized by Google

Fig. 28 will give a general idea of the spread of the H wave from a line source. Distance from the axis at O is reckoned along the base line, and the two curves show the intensity of H in the wave at two moments of time, say $t=1$ and $t=2$, when the wave front has reached P and Q respectively. The scale is quite arbitrary, because one curve is a copy of the other. At the initial moment, there is just the solitary infinite value of H at the commencing wave front, at O. The infiniteness is merely because f_0 is assumed to start action with infinite suddenness.

Now consider the state of things due to a line source in motion, or to a plane source steadily extending itself by the continuous addition of line sources at its straight edge. To fix ideas and formulæ, refer to Fig. 29. Let z_1 be the actual

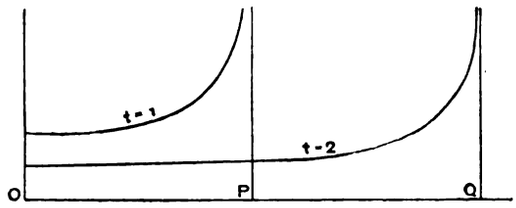

Fig. 28.

position of the edge of the plane source at time t, whilst z and r are the co-ordinates of the point P where H is to be determined. The directions of f and H are perpendicular to the paper. The origin of z may be conveniently situated at a distance to the left, to avoid negative values. Let the plane sheet be of density f per unit length along z, and start at z_3 at the moment t_3, and grow along z at speed u. The position z_2 indicates the limit of action at P. That is, P at time t receives H from the sheet between z_3 and z_2, but not from the part between z_2 and z_1, where its edge is situated. As for z_0, that is any intermediate position to be employed in the integral.

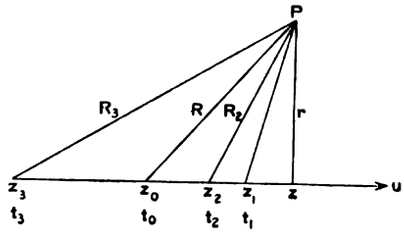

Fig. 29.

With the above conventions, the value of H at P is given by

$$H=\frac{fu}{2\pi\mu v}\int_{t_3}^{t_2}\frac{dt_0}{\{v^2(t-t_0)^2-r^2-[z-z_1+u(t-t_0)]^2\}^{\frac{1}{2}}}, \quad (27)$$

this being derived from (10) above by putting in the special distance concerned. The diagram is drawn for the case $v>u$, so that the time of going from z_2 to P at speed v equals the time of going from z_1 to z at speed u.

The above is the same as

$$H=\frac{fu}{2\pi\mu v}\int_{\tau_2}^{\tau_3}\frac{d\tau}{(v^2-u^2)^{\frac{1}{2}}\sqrt{\tau^2-a^2}}, \quad (28)$$

where

$$\tau=t-t_0-\frac{u(z-z_1)}{v^2-u^2}, \qquad a=\frac{\sqrt{v^2(z-z_1)^2+r^2(v^2-u^2)}}{v^2-u^2}. \quad (29)$$

Integrating (28), we get

$$H=\frac{fu}{2\pi\mu v(v^2-u^2)^{\frac{1}{2}}}\left[\log\left(\tau+\sqrt{\tau^2-a^2}\right)\right]_{\tau_2}^{\tau_3}, \quad (30)$$

provided $v>u$. But (28) may also be written

$$H=\frac{fu}{2\pi\mu v}\int_{\tau_2}^{\tau_3}\frac{d\tau}{(u^2-v^2)^{\frac{1}{2}}\sqrt{a^2-\tau^2}}; \quad (31)$$

so, when $u>v$, we have the result

$$H=\frac{fu}{2\pi\mu v(u^2-v^2)^{\frac{1}{2}}}\left[\sin^{-1}\frac{\tau}{a}\right]_{\tau_2}^{\tau_3}. \quad (32)$$

At present consider the case of $v>u$. Then the limits τ_2 and τ_3 are got by putting t_2 and t_3 for t_0 in the expression for τ in (29) above. At the lower limit in (28) the radical vanishes. So $\tau_2=a$. The upper limit depends upon the moment t_3 of starting action. So

$$H=\frac{fu}{2\pi\mu v(v^2-u^2)^{\frac{1}{2}}}\log\frac{\tau_3+(\tau_3^2-a^2)^{\frac{1}{2}}}{a} \quad (33)$$

is our solution. Note that H begins at P when $R_3=v(t-t_3)$. This makes $\tau_3=a$. So $H=0$ initially.

If we differentiate (33) with respect to t_3 we get a formula of the type (10), expressing the effect of the introduction of a stationary filament at z_3. But if we differentiate (33) to z_1, we obtain the formula for the H due to a filament of f introduced at z_3 at time t_3, and then moved at speed u to the right, being at z_1 at time t. In carrying out the differentiation, which is complicated, both τ_3 and a must be differentiated, because they both contain z_1. The result is

$$\frac{dH}{dz_1}=\frac{f}{2\pi\mu v}\left[\frac{v^2(v^2-u^2)^{-2}}{\{v^2(t-t_3)^2-R_3^2\}^{\frac{1}{2}}}+\frac{uv^2(z-z_1)(v^2-u^2)^{-\frac{3}{2}}}{\{v^2(t-t_3)^2-R_3^2\}^{\frac{1}{2}}\{\tau_3+(\tau_3^2-a^2)^{\frac{1}{2}}\}}+\frac{u(z-z_1)(v^2-u^2)^{-\frac{1}{2}}}{(z-z_1)^2+r^2(1-u^2/v^2)}\right]. \quad (34)$$

In this formula R_3 is defined in the last figure. It is connected with τ_3 by

$$(v^2-u^2)(\tau_3^2-a^2)=r^2(t-t_3)^2-R_3^2. \quad (35)$$

If f is understood to be the strength of the filament, then dH/dz_1 means the magnetic force to correspond. When $u=0$ we get the cylindrical wave from the stationary filament at z_3.

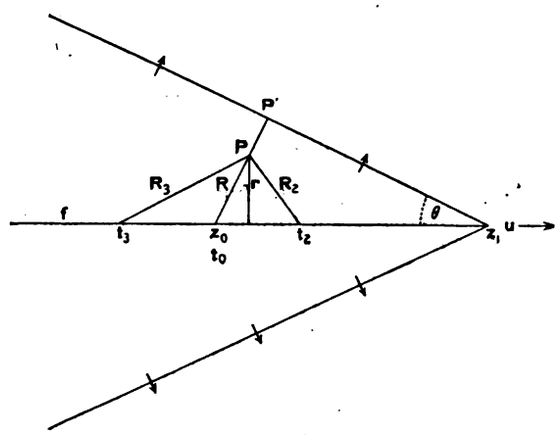

Fig. 30.

But when $t_3=-\infty$, we get the steady wave of H travelling with the filament when it has been in motion for a sufficiently long time. Calling this H′, it is expressed by

$$H'=\frac{f_0}{2\pi\mu v}\frac{u}{(v^2-u^2)^{\frac{1}{2}}}\frac{z-z_1}{\{(z-z_1)^2+r^2(1-u^2/v^2)\}}. \quad (36)$$

The eolotropic effect is now clearly visible.

When u/v is very small

$$H'=\frac{f_0}{2\pi\mu v}\frac{u}{v}\frac{z-z_1}{(z-z_1)^2+r^2}=\frac{f_0u}{2\pi\mu v^2}\frac{\cos\theta}{R} \quad (37)$$

where R and θ are the polar co-ordinates of P where H′ is reckoned with respect to the filament's position and line of motion. This formula may be readily checked by the static method.

There is always vanishing of H′ at the plane $\theta=\frac{1}{2}\pi$. At the same time, increasing u causes a concentration of H′ towards that plane. So, in the limit, when $u=v$, the result is two plane electromagnetic waves of reverse natures, both travelling the same way.

Now pass to the case $u>v$, equation (32) above, in which τ and a are known, whilst the limits have to be considered carefully. We require a separate figure. As the edge of the sheet advances the envelope of the cylindrical waves emitted by it make the wave front consist of two planes inclined to one another at the angle 2θ, the edge of the sheet being their meeting line. The angle θ is given by $\sin\theta=v/u$. Now if P is outside these planes, there is no H at all. When it is

Digitized by Google

just on the boundary, say at P', the cylinder from z_0 just reaches it, and $t_2 = t_3$. When it is inside the planes, as at P in Fig. 30, there are two limiting points, marked t_2 and t_3 whose distances from z_1 are u/v times the distance of the same points from P. In the figure $u/v = 2$. So the range of integration is from z_3 to z_2, or τ_2 to τ_3 determined by giving τ the corresponding values. That is to say, the H at P is entirely due to the filaments from z_3 to z_2. The waves coming from filaments to the left of z_3 have not reached P; nor have those coming from filaments between z_2 and z_1, which last is the position of the foremost filament at the moment in question. Here, of course, it is assumed that the sheet began to form before the time t_3. The range is, of course, less at the beginning. The important matter is the final result when the limits are full. Then we have

$$v^2(t-t_0)^2 - R^2 = v^2(t-t_0)^2 - r^2 - \{u(t-t_0) - (z_1 - z)\}^2, \quad (38)$$

and also

$$= (u^2 - v^2)(a^2 - \tau^2). \quad (39)$$

So the full limits are $\pm a$ for τ in equation (32). This makes

$$H = \frac{fu}{2\mu v(u^2 - v^2)^{\frac{1}{2}}}, \quad (40)$$

constant everywhere between the two planes.

(To be continued.)

ELECTRICITY WORKS FOR SMALL TOWNS.

Below we give an abstract of the discussion which followed the reading of a Paper on "Electricity Supply for Small Towns," by Mr. C. S. Vesey Brown, and a Paper on "The Lighting of Small Towns," by Mr. G. M. Harris, at the Municipal Electrical Association, at Huddersfield :—

Mr. J. E. EDGCOME (Kingston-on-Thames) said an important point was the choice of an engineer. How were small towns to find out the engineer they wanted at a fair salary? He thought the Municipal Electrical Association should be allowed to supply names of those engineers who could do the work for the smaller towns. The general procedure was to appoint a consulting engineer to put down the works and afterwards appoint an engineer to take charge of the works when completed. After a short time, however, it was generally found necessary to make extensions, and the expert was again called in. His advice, however, was often different from that of the resident engineer, but the latter of course knew better the needs of the particular neighbourhood, as he was continually on the spot. The result of this difference of opinion was often very serious, and impeded the progress of the undertaking. He thought that the Association should lay themselves out to suggest certain names to small corporations which had under 40,000 or 50,000 inhabitants, and he considered it would be best for the corporations to appoint at the beginning a resident engineer and pay him a fair salary for his work.

Mr. H. L. P. BOOT (Tunbridge Wells) said it was a very easy matter to put down works which would be remunerative from the first in such large towns as Manchester, Glasgow, and Edinburgh, but when they came to a small town where the revenue was small it was a more difficult task. He would like to lay stress upon the question of capital expenditure, which should be kept down. With reference to the question of site, it was important to bear in mind the smoke and vibration difficulties, and where possible to erect the generating works away from the centre of the town. Mr. Vesey Brown mentioned in his Paper that it was advantageous to have an economiser. He (Mr. Boot) thought, however, that where tubular boilers were in use the capital expenditure upon an economiser was too much for the little advantage which would be gained. He agreed that public lighting should be taken up from the very commencement of the works. He thought, from past experience, that gas engines should not be used in connection with the generation of electricity for public supply as they had not been a success at Belfast and Leyton.

Mr. R. C. QUIN (Blackpool) agreed with Mr. Brown that for small towns to engage a consulting engineer was better than appointing a resident engineer to design as well as superintend the construction of the works. In the first place a small town could not afford to pay a first-rate man, and it required a better man to design a station than to run one. He would prefer a system of Dowson gas generation and storage of the gas in place of electric storage or in place of thermal storage.

Mr. S. E. FEDDEN (Sheffield) thought local authorities should get expert advice. He could not agree with Mr. Brown respecting triple concentric cables because with the triple concentric the insulating material has to be usually of lead and trouble would probably arise through electrolysis. He would like to know from Mr. Harris what kind of pitch he used, as pitch had a bad effect upon lead.

Mr. E. TREMLETT CARTER said that Mr. Boot seemed to think from the experience of Belfast and Leyton gas-engine stations, as a prelude to larger steam-engine stations, were a failure. He considered, however, that the results at these two places were quite the reverse. It is possible to commence by using gas engines on a small scale very profitably, and then afterwards to build a large steam generating works for the more extended supply. That gas engine stations can be run satisfactorily and economically year by year is proved, for example, by the large gas-engine station at Leicester, worked by the Midland Railway Co., where there is a larger output than at many small electricity works. Dowson gas, however, could not well be stored; it has so much free hydrogen which diffuses through the metal plates, and the useful part of the gas gets away. Dowson gas is not adapted to storage.

Mr. A. G. COOPER (Colne) said he considered it was best to appoin at resident engineer to construct the works, as he was on the spot, and knew the local conditions much better.

Mr. H. C. BISHOP (Wigan) said he did not agree with the statement that gas engines might be used as the thin edge of the wedge. He thought it was necessary before beginning to erect the works to ascertain the probable demand. He considered the limit of a gas-engine station in size, to work economically, was 400 kw. Up to this size of works they were all right, but for larger than this he said it was better to have steam.

Mr. C. S. VESEY BROWN (Lincoln), in his reply, said that in order to run works successfully they must be put down on sound lines by a man who had had experience which enabled him to say at once if a thing was good or bad. If an Urban District Council advertise, they get a string of names with recommendations, and unless they take special precautions they have very little idea as to whether the man appointed is sound enough to carry out the work. The suggestion that the man living on the place is able to see more of the locality and know more about it was all very well from the point of view of treating with the consumers, but it did not cover the stability and the soundness of the plant, buildings, &c., put down. He thought it was better to have a consulting engineer; and if they tried to carry out the work under the assistance of the gas engineer, surveyor, &c., who had not had sufficient experience, then they might expect the undertaking to be a failure. In a small town he thought it was advisable to put down a small gas station, and afterwards replace this by a larger steam station as the works increased. He thought that the refuse destructor was not as good as a storage battery.

Mr. G. M. HARRIS (Bray), replying, said that he was glad the question of keeping down the capital outlay had been mentioned, as this was an important point. In reply to Mr. Fedden he said the pitch used was ordinary pitch, and he did not think it would affect lead. He thought they could do without the lead altogether; it was not necessary when they had pitch.

NATIONAL PHYSICAL LABORATORY.

We reported in our issue of June 22 that the Richmond Town Council had appointed a deputation to wait upon the authorities and protest against the erection of the National Physical Laboratory in the Old Deer Park, Richmond. This deputation duly had an interview with Mr. Hanbury, the Financial Secretary to the Treasury, and in order to dispose of their objections, an influential deputation of those interested in the scheme waited on Mr. Hanbury on Thursday last week. Amongst those present were Lord Kelvin, Lord Rayleigh, Lord Lister, Sir Courtenay Boyle, Sir John Wolfe Barry, Sir M. Foster, M.P., Sir E. Carbutt, Sir N. Barnaby, Sir Andrew Noble, and Profs. G. F. FitzGerald, Rücker, Schuster, Clifton and Elliott.

Lord LISTER explained the interest that the Royal Society and all the scientific bodies in the United Kingdom had in the new laboratory.

Lord RAYLEIGH, who is vice-chairman of the General Board and of the Executive Committee, referred to the valuable work already being done at the Kew Observatory in the Old Deer Park cognate to that proposed to be undertaken by the new institution. Besides, there were very few sites suitable to the new laboratory, owing to the character of the work to be carried out, which necessitated isolation from mechanical and electrical disturbances. Owing to the electrical disturbances that could be produced by tramways no private site would be suitable.

In reply to Mr. Hanbury, Lord RAYLEIGH said it was difficult to say at what distances such disturbances would do harm, and

Sir COURTENAY BOYLE added that there was a scientific committee now considering that very point, in order to advise the Board of Trade upon it.

Mr. HANBURY pointed out that the site of the National Physical Laboratory was within about one-third of a mile from the road.

Lord RAYLEIGH, continuing, said that the same principle was recognised by the Greenwich Observatory, which was placed in the middle of a park, as also was the case with the Potsdam University and the International Bureau of Weights and Measures at Sèvres. Comment had been made on the provisional arrangements with the Woods and Forests for 15 acres of ground. One of the reasons that such a large area was chosen was in order that the two buildings might be a considerable distance apart. It was proposed only to cover about a quarter of an acre with buildings. Other sites had been suggested and examined, but they were all open to the objection that there was no security against disturbance, and most of them were unsuitable on other grounds. Instead of the work to be done at Kew likely to constitute a nuisance, it was to get away from nuisances that the executive committee sought to go to Kew. Quiet was exactly what was wanted for their own purposes. Many of the investigations he himself proposed to carry out could not be done at the Royal Institution, but had to be done at his own residence in Essex, where there was freedom from vibration.

Mr. HANBURY pointed out that the Woods and Forests had only power to grant a yearly lease.

Sir J. WOLFE BARRY said he was the representative of a society interested in applied science numbering 9,000 members, and that it was extremely important to establish this laboratory from the point of view of the trade of this country and of the huge commercial interests at stake. Kew possessed advantages which could not be obtained at any other place within a reasonable distance of London. It was easily accessible and quiet.

Digitized by Google

Lord RAYLEIGH said that they were going to re-let part of the ground to the Mid-Surrey Golf Club. It would remain under the control of the committee of the laboratory, and the golfers would be on their good behaviour.

Lord KELVIN, Sir ANDREW NOBLE, and Prof. RÜCKER also spoke.

In reply, Mr. HANBURY said that he hoped the deputation were under no misapprehension whatever as to the strong desire of the Treasury to carry out the scheme for a physical laboratory. The money had been promised, and they were anxious to find a site. There was no doubt whatever as to the absolute importance to the country of having such a laboratory. That was not the question raised by the Treasury, or by any deputation. The real difficulty had been how far this undertaking would interfere with the amenities of Kew Gardens. It was desirable, so far as possible, to satisfy both the scientists and the lovers of nature. Undoubtedly there had been some alarm among a certain portion of the public that the laboratory might to a certain extent interfere with the amenities of Kew. He was bound to say that the impression gathered from the deputation to-day was that to a great extent that alarm was unnecessary. The previous deputation had represented to him the danger of the quiet being disturbed by the noise of the operations in the two proposed buildings, but from what had just been said he was satisfied that on that point, at any rate, there need not be any alarm. The most important point that had come out was whether, after all, on this site the laboratory itself was secured against electrical disturbance. He need not express any opinion upon that. They ought to wait for the report of the Board of Trade committee to see how far that would meet their requirements. He understood that if any extension of the buildings were required, it would be only to a little extent, and the public need not fear that the whole of the 15 acres would be built over.

PARLIAMENTARY INTELLIGENCE.

CHARING CROSS AND STRAND ELECTRICITY SUPPLY CORPORATION'S BILL.

On Friday the Select Committee of the House of Lords, of which the Earl of Roese is chairman, commenced the consideration of the bill promoted by the Charing Cross & Strand Electricity Supply Corporation (Ltd.), to enable them to construct a generating station in West Ham, and to lay mains connecting their generating stations, to acquire lands, to construct a short line of railway, &c.

Mr. PEMBER, Q.C., for the promoters, said they had power to supply in the districts of St. Martin-in-the-Fields, the Strand, Finsbury, and the City of London. In the latter order there was a special provision that the company were to erect a new generating station for the City within two years on a site to be approved by the Corporation, which was not necessarily to be within the City boundary. The West Ham site had been so approved. The main factors in choosing a site was to have facilities for both land and water, carriage of coal, enormous quantities of which were consumed by a large electric undertaking. During the last year or two very large powers had been given to electricity supply undertakers to take their mains through intervening districts to connect up their areas of supply, as in the case of the Metropolitan Electric Company and the Central Electric Supply Company. In these circumstances it did not lie in the mouths of local authorities to object to their streets being broken up. The site selected under this bill had an area of 7½ acres. The surrounding premises were all of a business character, so that there was likely to be little public inconvenience. Opposition to the scheme was presented by the local authorities of West Ham, Mile End Old Town, Poplar and Whitechapel (through whose districts the mains of the company would run), and the Corporation of the City of London. Each one dealt with the breaking up of streets, to which they took exception. The City did not oppose the scheme in the other House. They were informed of the intentions of the company to apply for the site, and they approved of it; but they now opposed on a petition, the gist of which appeared to be that they objected to the proposal of the company to lay in the City mains, not only for the supply of the City itself, but for supplying places beyond. It did seem a little unreasonable that the City should be perfectly willing the company should have a generating station in West Ham, from which the company should lay mains, through the territory of other authorities, for the benefit of the City, and should at the same time object to the company taking mains through the City for the benefit of other people beyond.

Mr. SHIRESS WILL, Q.C., here took up the argument for the bill. He said: The Corporation went on to allege that whereas the Order of 1899 intended that the supply of electric energy to the City should be a separate and distinct undertaking the proposals of the bill overrode that intention to their disadvantage; and further, the effect of the bill, if passed, would be to render the supply by the company of electrical energy to the City subsidiary to the company's other undertakings. The bill, they held, authorised the company to break up and otherwise interfere with the streets of the City for the purpose of connecting their generating stations outside of the City, but imposed no obligation to use the mains and works for City lighting. The company having broken up the streets of the City under this bill could not be compelled to supply electrical energy to the City as provided by the Order of 1899, but could use the mains and works solely for the purpose of connecting with the other areas of the company, and so be enabled to dispose of some or all of their existing generating stations and realise considerable pecuniary advantage thereby without fulfilling their obligations to the Corporation. The granting of the powers contained in the bill would create a mischievous precedent, involving probably many similar applications from commercial companies who, for pecuniary considerations, might wish to establish generating stations outside London. As to the question of precedent, counsel proceeded, Parliament had approved of authorities going outside their areas; and in this case the City itself had approved. Then it was said no provision was made for the transfer to the Corporation of the mains and works referred to in the present bill. The answer to that was that the undertaking of the company as it affected the City would be kept quite distinct from the company's other works and could be transferred in the ordinary way at any time. As to breaking up the streets, the Committee would suppose from the statements in the petition that the company had no power at present to break up streets in the City; but by the Order of 1899 they had such power, and the only extra power sought was as to connecting the new station with the company's existing area of supply outside the City, by laying in a trough or tube a couple of extra wires.

Mr. W. H. PATCHELL, engineer-in-chief to the promoting company, said he had large experience in laying electric light mains in London streets. The company, in accordance with the order of last year, examined a number of sites in the City, but owing to the enormous price and great inconvenience involved it was found impossible to acquire one. Then they fixed on an ideal site at West Ham. On that site they proposed to erect two generating stations, one for the supply of electricity to the City and one for the supply of electricity to the company's other districts. Each station was complete in itself, and quite apart from one another, so that if ever the City elected to buy their portion of the company's undertaking they would be able to acquire their generating station. There would be five different sub-stations in the City, each of which would require a cable. There would be seven cables from the generating stations at West Ham to the City, five for the use of the City, the two others being carried through the City for the use of the West End. By the time the new station at West Ham was built a further supply would be required for the western districts of the company, and this extra supply it was intended should come from the new works. The same trench into which the company could put the five cables to supply the City would also contain the other two for the supply of the districts beyond the City; there would be no more breaking up of streets to put down seven cables than there would be to put down five. There would be no difficulty in laying the mains along the scheduled thoroughfares. With regard to the power in the bill to supply the local authorities through whose districts the mains passed, he said power was only sought to be allowed to supply them in bulk when requested; no power to compete was asked for. The company were now supplying in the whole of their district 206,090 8 c.p. lamps. It would not be practicable to carry the cables for the whole route along the route of the Great Eastern Railway Company. The main objection to carrying the trunk mains along the Great Eastern Railway was the fear of some railway accident which might injure them. The London Electric Company originally brought their mains along the line of the South Eastern Railway, but found it advisable to move them.

By Mr. RIGG, representing Mile End Old Town: You have taken advantage in this bill to get powers to carry mains from the West Ham station to the West End?—Certainly.

And power to supply in bulk to outside authorities, which is a power you had not got in the original order?—That is a fresh thing in the bill, but they are not exactly outside authorities; they are authorities through whose area we pass, and they need not take it unless they like.

But those authorities have electric lighting orders of their own?—I do not know that.

The only use of this power to supply in bulk will be to supply to somebody outside the authorities through which you go?—No, that is not intended at all. The only power we take to supply electricity in bulk is to those local authorities if they desire it.

By the CHAIRMAN: The voltage to be used on this main was not absolutely settled; it would probably be about 10,000.

Mr. LITTLER, Q.C., at this point said the opposition of the City was satisfied. A clause had been agreed to as follows:—

"New clause 14*a*.—The mains for supplying electricity to the City shall "be defined and appropriated to such supply, and such mains shall be subject "to the terms of purchase set forth in section 62 of the City of London "Electric Lighting Order, 1899, but if the local authority under the order "shall exercise their option of purchasing the generating station under the "provisions of section 2 of the Electric Lighting Act, 1888, instead of under "section 62 of the said order then the said mains shall be purchasable on "the terms set out in section 2 of the Electric Lighting Act, 1888. In the "event of purchase by the said local authority of the said mains the powers "conferred on the company by the section of this act whereof the marginal "note is 'Power to lay connecting mains,' shall so far as they are directly "applicable for the purposes of the undertaking under the City of London "Electric Lighting Order, 1899, be exercisable by the said local authority. "None of the streets of the City mentioned within the second schedule shall "be broken up under the powers of this act without the previous consent in "writing of the Corporation, which consent shall not be unreasonably with-"held, and such consent shall be presumed if no dissent in writing be received "by the undertakers from the Corporation within one month from the "receipt by the Corporation of the application for such consent. Any dis-"pute as to the withholding of such consent shall be referred to and finally "determined by the Board of Trade or by an arbitrator to be appointed "by the Board of Trade as the Board may see fit."

Mr. E. W. MONKHOUSE, C.E., for the bill, said he had had large experience in laying down electric cables in the public streets of Edinburgh, Westminster, Broad-street, Piccadilly, Oxford-street, and other crowded thoroughfares. He knew the proposed route from West Ham to the City. The roads were peculiarly broad, save at one part, and there would be no difficulty in taking the cables through them.

Digitized by Google

Mr. READER HARRIS, Q.C., for the Poplar Board of Works, said all the local authorities were unanimous in opposing the measure, none of them deriving any benefit from the bill. He suggested that the promoters should go on with the construction of the generating station, but that for the cable route they should wait until next session. They would lose nothing by waiting, as the conduits would be laid in six months, and would be ready in time for the generating station. Next year they could come for power to carry the cables through the route the local authorities suggested in their petition, which would not be open to the charge of causing inconvenience.

Mr. O. E. WINTER, C.E., surveyor to the Poplar district, described the underground condition of the main road in Poplar, under which it was proposed to lay the cables. There were a large number of pipes beneath the surface, including trunk gas and water mains. To lay the cables along this route would cause great inconvenience. There was another route available through Poplar, running parallel to the proposed route, where the cable could be laid without interfering with trunk gas and water mains. He admitted that the Poplar local authority had themselves laid pipes for electric cables along Bow-road. It was said that the Poplar district would derive no benefit from the laying of these cables, but the cables would no doubt be rated, and the electrical supply of the promoters would, doubtless, be available to Poplar if their own supply went wrong.

Mr. J. KNIGHT, C.E., surveyor to the Mile End Old Town Vestry, said the County of London Company had given notice of intention to lay five lines along the main road, two on one side and three on the other, and in addition the local authority had an electrical undertaking of their own, and would have to lay down lines of pipes.

Mr. SHIRESS WILL: And do you propose to lay them down the main road?—We shall have to.

Mr. JAMESON, surveyor to the Whitechapel District Board of Works, said his Board did not object to the company's mains passing through the district to supply electricity in another district, but they did object to the pipes being laid in their main streets. It would not be physically impossible to lay the mains in the main thoroughfare as proposed, but it would occasion great inconvenience to the public.

Mr. LITTLER, for the Whitechapel Board, said two applications to lay mains in this main thoroughfare of Whitechapel on the part of two companys—one hydraulic and one electric—had been refused already. Moreover, Sir James Kitson's Committee, which had been sitting so long this session, dealt with this very point by deciding that where powers were given for the erection of a generating station outside the area of supply, the mains laid from the generating station to the area of supply should be laid in such a line of streets, and in such trenches and of such dimensions as might be agreed between the promoters and the road authorities through whose districts the mains were to be laid. His own clients and the other authorities concerned were willing that the generating station should be sanctioned, but asked that the other portion of the bill, as to laying mains in the intervening district, should not be authorised, in return for which the local authorities would undertake not to oppose an application by the company next session for a route other than that proposed. The local authorities would endeavour to agree with the company what this route should be, or, failing agreement, to submit to what the Board of Trade might direct.

Counsel for Poplar and Mile End assented.

Mr. PEMBER, in reply, said there was a growing tendency on the part of Parliament to treat electricity as one of the necessaries of life—as being on a par with water and gas—and that to do anything which would prevent electricity being easily and cheaply supplied to the people of London would be an extremely injudicious, unwise, and unstatesmanlike thing. These generating stations outside the area of supply saved an infinity of stations in the large and populous inner districts, and being much larger than they would be if constructed in each district, enabled the supply to be given much more cheaply. The essence of the present scheme was that the mains should be brought as straight as possible over the long distance between the generating station and the City because the principal expense attending the supply of electricity in this way was the length of cable laid. He must therefore decline to accept the arrangement proposed by Mr. Littler, because under it the company would be sent first up this street, down another, then back again, and so on, and by the time they had satisfied all these authorities they would have laid probably four or five times as much main as was now proposed, which would add enormously to the price at which electricity could be supplied.

The CHAIRMAN said: The Committee are of opinion that the preamble is proved.

The Committee then proceeded to the consideration of the clauses. On clause 8 Mr. READER HARRIS raised objection, alleging that, as submitted, it would give a perfectly unlimited right to the company to lay any number of pipes or mains through their districts, not merely for the supply of existing areas of supply, but for other districts which the company might in future obtain power to supply in.

Mr. SHIRESS WILL said he would limit the clause to the existing areas.

Mr. READER HARRIS then submitted a series of clauses for the protection of the local authorities, the chief of which was designed to restrict the amount of space which might be occupied in the roads by the company to not exceeding 2ft. 6in. square.

Mr. RIGG, for Mile End, contended that the general law could not apply to the local authorities outside the City, because "local authority" in the order clearly meant only the City.

Eventually the wording of the order was altered, with the consent of the promoters, so as to extend the protection of the general law to the outer authorities, the Committee declining to grant them anything further, or to give the clause asked for the purpose of restricting the space to be occupied.

The bill was ordered to be reported.

NORTH METROPOLITAN ELECTRIC POWER BILL.

The Committee of the House of Commons, of which Mr. A. H. Brown is chairman, met again on Monday to consider the clauses of this bill.

On clause 8, relating to the conditions of supply, by which it is provided among other things that authorised undertakers requiring a supply of electrical energy shall serve a notice on the company specifying the point at which the supply is required, the maximum power required to be supplied, and the purposes for which it is required to be supplied,

Mr. LEWIS COWARD (on behalf of the local authorities) asked the Committee to amend the clause by requiring the notice also to specify the form in which the supply is required.

The CHAIRMAN: The words of the clause are copied from the Durham bill.

Mr. MOON (for the promoters): It is not a notice to be given by the company at all but by the undertakers, who can give what notice they please to the company, If they like to state the form of the supply they can do so, but it would not impose any obligation on the company.

Mr. ROBERT HAMMOND, recalled, and asked by Mr. Lewis Coward why he attached importance to the insertion of the words "the form in which the supply is required," said his reasons had reference to the question of price. The price scheduled in the bill set forth what was to be paid for the energy, and it was an understood thing that the energy should be transformed from the high voltage at which it entered the district into the necessary voltage for use in the district at the expense of the undertakers. In order to make the clause perfectly clear, it should put on the undertakers the obligation to specify the form in which the supply is required for use.

Mr. TREVELYAN: Supposing that the authorised undertakers apply to this company for a supply of electricity at a certain voltage, will the company be bound to supply it at that voltage?—I think that obligation should be put on them. I was afraid that it was not quite clear.

By Mr. MOON: How will it assist you?—It would assist me in getting what I want, viz., the electricity at the voltage at which I can use it. I have read the clause carefully, and I think it would be improved by making it perfectly clear that it is the intention of the company to supply electricity at the required voltage.

Is it your view of the clause that it precludes the local authorities from asking for a supply of electricity at any particular voltage?—I am informed so.

Mr. MOON: That is a matter of construction on which the Board of Trade would be as capable of forming an opinion as you?—Perhaps so.

Mr. FORBES LANKESTER: Do the promoters, or do they not, intend to give the local authorities electrical energy transformed in the way they require? If their intention is to give it to us in that form, what objection is there to make it clear in the clause? If it is not their intention to give it in that form, we ought to know that.

The CHAIRMAN: Suppose a local authority want a voltage of, say, 200 volts, and they apply to this company to get it, and the company say "No, the voltage is 10,000," of course the authorities have no power, but simply to say: "You must transform it." It would be a question of terms.

Mr. FORBES LANKESTER: Then the question would arise, Who is to pay for the transformation? The intention of the promoters, as we understood, was to supply electricity to us in the transformed shape to any voltage we might require.

The CHAIRMAN: If the company supplied at 5,000 volts the Board of Trade would say that that must be transformed. It appears to me that the words are unnecessary. With the amendment we are satisfied with the clause.

Mr. Frere, on behalf of the Edmonton Local Board, and Mr. Forbes Lankester, on behalf of Wood Green, and Mr. Bartley Denniss, for Harrow, applied that a longer term should be granted than in the Durham case to enable the local authorities to have first choice to give a supply of electricity. It was asked that the act should not come into operation until Oct. 1, 1901, so that they might have time to apply to Parliament next session for powers, either alone or in conjunction with other authorities, to supply electricity in this district. It was pointed out that six of the local authorities had resolved to go for a joint scheme by provisional order, that the Tottenham bill had actually passed through the House of Commons, and that the Harrow Electric Lighting Order had been passed by the Board of Trade and received the assent of Parliament this session.

After the Committee had conferred the CHAIRMAN said they declined to grant the application.

On the clause prohibiting the company from supplying within the area of supply of any authorised distributors for use by the authorised users exclusively within that area, except with the consent of the distributors, Mr. Frere asked the Committee to strike out the word "exclusively," which he contended would defeat the object of the clause, which was to protect the local authorities and to enable them, if they were in a position to do so, to supply electricity to the tramways within their districts.

Mr. ROBERT HAMMOND, supporting the proposed amendment, said the tramways of the North Metropolitan Company passed through Edmonton, Tottenham, and Enfield, and the local authorities of those districts hoped to have the power of supplying the tramways with electricity, and thereby to improve the load factor. In the case under consideration the electricity would not be for the exclusive use of the districts of any of the three local authorities mentioned; of course it could not be stopped going somewhere else. By the retention of the word exclusively the whole object of the clause would be evaded.

The CHAIRMAN said the clause had been decided in the Durham case, and as there was no difference in this respect between the case of the North Metropolitan, the Committee could not accept the amendment.

Mr. HARPER asked for a special clause providing that the Middlesex County Council should have the same power of supervision as the local

Digitized by Google

authorities over the opening and breaking up of the roads by the Electric Power Co., on whose behalf Mr. Worsley Taylor, Q.C., expressed his willingness to come to the same arrangement with the Middlesex County Council as was come to with the Durham County Council.

The Committee refused to insert Mr. Harper's clause, but offered to put in the Durham clause on the understanding that it obviated opposition in the House of Lords.

Mr. HARPER declined the concession.

The remaining clauses having been adjusted in accordance with the Durham precedent, the bill was reported for third reading.

ELECTRIC POWER BILLS.

The Committee of the House of Commons on Electric Power Bills resumed its investigations on July 6, when a long discussion took place on the clauses of the South Wales, Lancashire, and Durham County bills. The Chairman placed before counsel for the promoters of the three bills a clause drafted by the Board of Trade, and providing that if within a year of the date of the passing of the bill a company had not substantially commenced to carry out their powers, and if within three years they had not erected generating stations an order might be made by the Board of Trade bringing such companies powers to an end. Counsel expressed their willingness to accept the clause if the one year were altered to two and the three years to five. Counsel for the Lancashire bill, however, suggested that a clause in that measure providing that a certain amount of capital should be subscribed before the works were commenced should, under the circumstances, be struck out.

Further points having been discussed, the Chairman announced the Committee's conclusions as follows:—

"The decision of the Committee as to the South Wales Bill is that the standard dividend be not subject to revision, and the relation between price and dividend will stand. With regard to the question of overhead wires, in Durham only, in the districts of urban authorities, the local authority will have an absolute veto. In the districts of rural authorities the rural authorities will have only a qualified veto. With regard to the cessor of powers, two years and four years will be substituted for one year and three years. The provision in the Lancashire bill as to the subscription of capital will be struck out. In the South Wales bill the maximum price will be reduced from 4d. to 3d., in accordance with the offer of the promoters. In the Lancashire bill the nature of the cable will be left subject to the Board of Trade. The local authority will not have any power over the nature of the cable. As to the question of disuser of mains, three years will be substituted for one year, and the words 'or any part thereof' will be inserted. With reference to the obligation to supply, there will possibly be some draft amendments, and the penalty will be £10 a day, with a limit of £500 cumulative. The other points raised are only points of drafting, which will be settled after discussion between the Government draughtsmen and the agents of the bill."

On Monday the Committee held its final sitting. The clauses of the three bills were adjusted in accordance with the various decisions of the Committee and the measures were ordered to be reported to the House for third reading.

WIRELESS TELEGRAPHY.

In the House of Commons on Friday last, in reply to a question on the subject, Mr. RITCHIE said the wireless telegraphy communication between the East Goodwin light vessel and the mainland was established for experimental purposes only, and had now been discontinued. He was not aware of the exact nature of the system in use on the Borkum light vessel. The question of using a system of wireless telegraphy for communication with lighthouses and light vessels was before an inter-departmental committee, who had very difficult questions of patent rights to consider.

In the House of Commons on Monday, Mr. RITCHIE stated, in reply to a question by Sir R. Penrose-Fitzgerald, that the inter-departmental committee on the question of wireless telegraphy for life-saving purposes was appointed to consider and report (*a*) with respect to the provision and maintenance of communication between outlying lighthouses and light-vessels and the shore, and whether any, and if so what, extension and improvement could be made therein, special regard being had to a system of wireless telegraphy; (*b*) how far and subject to what conditions the means of communication with such light stations could be made available for private messages without affecting the efficiency and safety of the light-house service; and (*c*) how far the connections between shore lighthouses and post offices or coastguard stations should be made available for private messages. This committee had superseded that appointed in consequence of the recommendation contained in the final report of the Royal Commission on Electric Communication with Lighthouses and Light Vessels, and comprises representatives of the Board of Trade, Admiralty, Treasury, Post Office, and Trinity House.

In reply to a further question Mr. RITCHIE said the committee would endeavour to ascertain from the German Government and the German lifeboat authorities the nature of the system of communications with the Borkum light vessel which had been recently adopted.

WEST BROMWICH CORPORATION BILL.

On Tuesday a Select Committee of the House of Lords considered this bill for powers (*inter alia*) in respect of tramways and electric lighting. The South Staffordshire Tramways Co. opposed the clauses by which the Corporation asked for working powers over portions of the tramways outside the borough.

For the promoters, Mr. GERALD FITZGERALD stated that, as West Bromwich was entirely surrounded by large boroughs and urban districts, it was of the greatest importance to the artisan population that there should be a good system of tramway communication, and the Corporation attached great importance to that portion of the bill. The South Staffordshire Co. owned 5 miles of tramways within the borough, and the Birmingham and Midland Tramways Co. 2 miles or 3 miles. The Corporation asked for powers to purchase the outlying portions of the tramways beyond their boundaries, which would form good connections with the tramways authorised within the borough. In 1902 the Corporation would buy up the 5 miles of the South Staffordshire Company's within the borough, and other boroughs, such as Handsworth, Tipton, and Wednesbury, would have similar opportunities of buying up the South Staffordshire. He thought the opposition really came from the British Electric Traction Co., who were seeking to work tramways in the district.

Mr. A. D. GREATOREX, borough surveyor of West Bromwich, gave evidence with regard to the tramways.

Mr. LITTLER, Q.C., for the South Staffordshire Company, said the Corporation were seeking to pick out all the plums of his company's line, and to pay only old iron prices.

The CHAIRMAN announced that the Committee had decided not to give the Corporation power to work the tramways outside the borough. They would only have power to work within the borough.

MUNICIPAL TRADING.

The Lords and Commons Joint Committee on Municipal Trading met again on Friday last, the Earl of Crewe presiding.

Ald. SOUTHERN, of Manchester, continuing, stated that the Manchester tramways had at the outset been the property of the Corporation, and were constructed by them. They had determined to work the tramways themselves, and to adopt electric traction on the expiration in 1901 of the present lease of the company now working them. They had also made arrangements to work the tramways of certain urban districts adjacent to the city. The arrangement was that Manchester should pay a rent to the outside local authorities for the use of the tramways.

The CHAIRMAN: You know the objection that is taken—that you are speculating with the money of the Manchester ratepayers for enterprises outside your own area?—WITNESS replied that it was necessary to provide housing for the population displaced by the demolition of insanitary dwellings, and one way of doing this was to erect cottage dwellings outside the city, where land was cheap. This involved the necessity of some means of cheap and fairly rapid communication, and in the arrangement of tram routes this point had been specially considered.

Asked as to the electric undertaking of the Corporation, WITNESS said that in 1890 they obtained power to supply electric current within the central part of the city, and in 1896 the power was extended, and was to embrace the whole of the city. The works were completed in 1893, and the supply of current had since been continuous. The expenditure on land and works had been £641,821. The mortgaged debt amounted to £556,278, and the mortgage redeemed by sinking fund to £49,232. The income for 1899-1900 was £86,297, expenditure £49,905, gross profit £36,392, equal to 6·41 per cent. on capital invested. The number of consumers in 1894 was 412, and is now 3,249. The price in 1893 was 8d. per unit, or 2d. per unit and £3 per quarter per unit of demand. In 1900 these prices had been reduced to 5d. per unit for lighting, or 1½d. per unit and £1. 15s. per quarter per unit of demand. In 1898-9 the amount paid in aid of rates was £12,000. The Corporation had been authorised by Parliament to extend their operations into neighbouring districts, and had already arranged with several district councils. There seemed to be an impression that electrical power was chiefly sought by large consumers, such as colliery companies. In Manchester the reverse was the case, as it was the small consumers who wanted and took the power. In conclusion, witness said he did not wish to see municipal enterprises largely increased, but he thought it desirable that any enterprise which interfered largely with the public roads should be in the hands of the local authority.

Mr. D. S. WARD, alderman of Harrogate, said the Corporation had charge of the electric supply of the town. Their electric works had only been completed for about three years. After about 14 months' working the Corporation decided to reduce the price by allowing a discount of 5 per cent. to all consumers who paid their accounts within 15 days, and of 2½ per cent. to those who paid within a month. They also decided to adopt the Brighton system. The Corporation were exceedingly satisfied at having undertaken electric lighting themselves instead of putting it in private hands.

Mr. DAVIES, secretary of the Chesterfield Chamber of Commerce, said that body had made a speciality of the subject of municipal trading, and as a general result it came to the conclusion that the greatest objection to municipal trading was that it was not so much to be depended on for the supply of the commercial necessities of the community as private trading.

The CHAIRMAN: Have you any instances to give?—WITNESS: There is the case of Cardiff. The Corporation of that town started supplying electric energy some years ago. The works were not quite up to date, and there were some failures—I believe frequent failures. The Corporation, after taking the best advice they could, determined to get authority to extend their plant very materially. They deposited a bill for the purpose, but on the bill being submitted to the ratepayers of Cardiff at a poll a very large majority refused to proceed in the matter. Witness added that if London were to carry on all the undertakings that, say, Huddersfield was carrying on it would have at once to increase its indebtedness by £200,000,000, which was equal to nearly one-third of the National Debt.

On Tuesday Lord Provost CHISHOLM, of Glasgow, denied that the various undertakings carried on by the Corporation of that city were conducted for trading purposes. He said the Corporation tried to make them all pay, but the profits were applied not to reduction of rates but to the improvement or reduction in the price charged for the commodities supplied. They carried on both the gas and water undertakings to the

Digitized by Google

great advantage of the citizens, and had reduced the fares on their tramways by from 30 per cent. to 50 per cent., besides providing a much better service of cars. They now carried 2,500,000 passengers a week on these lines, and the electric system of traction had been introduced. He did not believe that a company would have been as enterprising with reference to the tramways as the Corporation had been. The first aim of a company was undoubtedly to make profits, while the first aim of a corporation was to conduce to the comfort and convenience of the citizens. There was no disposition on the part of the Glasgow Corporation to apply any of the tramway profits to the reduction of rates.

The CHAIRMAN: What have you to say about electricity supply?—We obtained power to supply electricity within the city boundaries in 1890 and for some years the undertaking was carried on as the partner of the gas undertaking. Since it has been constituted a separate enterprise it has been carried on with much greater vigour. We have over 3,000 consumers. Our capital expenditure to May, 1899, was £3,888,589, and our revenue for the past year £44,000. The price charged for current averaged from 6d. to 2d. per unit, against 7d. per unit when the works were first opened in 1892. We have power to arrange with outside authorities but we have not yet completed arrangements with them.

Do you think that you have shown all reasonable enterprise in connection with your electric supply?—I think we might have gone ahead a little more vigorously at the beginning. A circumstance which, in my opinion, accounts for that dilatoriness was its being worked by a sub-committee of the Gas committee. Hydraulic power was supplied under the Corporation's Waterworks Act. They were pressed by manufacturers to supply it, and as the Corporation was extremely unwilling that there should be any interference with their streets by a private company they decided to supply it themselves. Their annual revenue on this account was £6,607, and their annual expenditure £7,715, showing a deficiency of £1,044. The loss was paid out of the surplus of the ordinary water enterprise.

On the question of telephones, WITNESS said the Corporation had obtained a licence to work a telephone system throughout the city, and were at present in course of establishing such a system. Their area would be identical with that of the National Telephone Co., with whose service they were dissatisfied. That was why they had obtained a licence of their own. The telephone had become a necessity of business life, and it was practically a monopoly, while to carry it out effectually required the use of the streets.

The CHAIRMAN: You propose to lay your wires underground?

WITNESS: Practically entirely. From exchange to exchange they will be underground, but to individual houses they will be along the roofs.

Did you give leave to the National Telephone Co. to break up the streets?—No. Witness went on to say that in his opinion when an undertaking met a necessity or had a monopoly, and required the use of the streets, as was the case with the telephones, a corporation was entitled to take it over and work it.

And you think you can undertake this better than an ordinary trading company?—Well, we have had proof for many years that the company cannot or will not do it, and we therefore intend to do it ourselves. The question never would have arisen but for the fact that there was the greatest dissatisfaction in the operations of the company. Glasgow employed 8,021 men, women, boys and girls in its various undertakings, including the police, the gasworks, and the tramways. He did not think there was any danger from having so many Corporation employés. They formed but an infinitesimal fraction of the whole body of voters. There were 132,000 electors in Glasgow, and he took it that only 6,500 of the Corporation employés were voters. There were always one or two close contests at the municipal elections.

Do you think that there is any danger of a combination between your employés, perhaps in conjunction with other workmen, to put pressure on candidates for municipal offices?—I do not think there is any real danger. I think that the other workmen would be quick to see that; as they contribute to the rates which support the police, and as they contribute to the success of the tramways and other undertakings, their interests are not the same as those of the Corporation employés.

Mr. R. H. SMITH, of Sheffield, general secretary of the Federation of Ironmongers' Associations, said several of the associations had considered the question of municipal trading. Owing to the sale of gas stoves and internal electrical fittings by municipalities, the retail trade had suffered very considerably, and prices had been very much affected.

The Committee adjourned till to-day (Friday).

BAKER-STREET & WATERLOO RAILWAY.

The Select Committee of the House of Lords, presided over by Lord Rosse, on Tuesday considered this bill, which has already received the sanction of the Lower House. The proceedings before the House of Commons Committee were reported in our issue of May 4, page 61.

Mr. WORSLEY TAYLOR, Q.C., for the bill, repeated his opening statement, and said the only opponent of the measure in their Lordships' House was the Metropolitan Railway Co., whose opposition was mainly based on fears of competition.

Mr. W. R. GALBRAITH, C.E., gave details of the scheme. He said in 1897 negotiations were entered into with the London & Globe Financial Corporation, and an agreement entered into by which that company were to receive the whole of the capital and to construct the line, equipping it and making it ready for traffic. A sum was also to be handed back to the company to meet contingencies in working. The Globe Company entered into agreements with Messrs. Perry to construct the line for £877,000, exclusive of land, equipment and engineering expenses, which, together with the £50,000 handed back to the Baker-street Company, had to be met out of the £889,000 remaining capital. The result would be that the Globe Company might or might not have in their pocket the sum of £152,000 on completion of the line. Every contractor reckoned to make 10 per cent. on large works, and he did not see why the London & Globe profit should be objected to as an extraordinary immoral procedure as it had been. An Act had been obtained last year for the deviation of the line at Waterloo, and for the construction of subways at Trafalgar-square, and capital powers of £80,000 granted for that purpose. The shaft had been driven more than half-way across the river, and the tunnels would be completed to Piccadilly-circus next month. Under the rejected scheme of last year they had proposed to pass under the Regent's-canal, and also to make an extension to Euston. They now only propose to go to Paddington, and to construct stations at Edgeware-road and at Bishops-road. The railway and subway had received the assent of the Great Western Railway Co. In order to connect the line with the proposed generating station, it was necessary to extend it from Waterloo towards the Elephant and Castle. The length of the southern extension with subway to meet the City and South London would be about three-quarters of a mile, and the cost, together with the short branch connecting with the generating station would be £263,000, and the total cost of the works under the bill £945,000. The Metropolitan Railway Co., as he understood it, did not fear the works so much as competition. Arrangements had been made to get the works carried out for the estimates in the same way as before. Witness was exhaustively cross-examined by Mr. Littler, Q.C., for the Metropolitan Railway Co. in regard to the agreements with the London & Globe Company.

Sir WILLIAM POLLITT, general manager of the Great Central Railway, said the railway was a good line to begin with, but the proposed extensions would considerably improve it and make it more advantageous to the public. It would connect the Great Central with the Great Western Railway, and enable people easily to reach the suburban districts. The extension on the south side would much improve the scheme, and any additional means of carrying the dense population cheaply and expeditiously was an enormous public advantage.

Mr. J. L. WILKINSON, general manager of the Great Western Railway spoke strongly in favour of the bill.

Mr. C. J. OWENS, general manager of the London & South-Western Railway, said the traffic from Waterloo was increasing more rapidly than from any other terminus. The western and northern extension were very necessary for the completion of the Baker-street Railway. The lack of communication between the great termini could only be remedied by underground electric railways.

For the opposition, Mr. JOHN BELL, secretary to the Metropolitan Railway Co. gave evidence. He said the line was a purely speculative one with ulterior objects. Future extensions were what were feared. He did not think the line would be financially successful, but would do a vast amount of harm to the Metropolitan Company without benefiting the promoters. He did not consider there was any necessity for the proposed extension to Paddington, and further extensions were probable if the present northern one was sanctioned. It was hard that the Metropolitan Company after having constructed their line at enormous expense, should now have their vested rights materially interfered with. The extension of the promoters' line to Paddington would establish competition at Bishop's-road, Praed-street, Queen's-road, and Royal Oak.

Sir J. WOLFE BARRY, C.E., corroborated generally the evidence of Mr. Bell.

Mr. PAGE, Q.C., for the promoters, said it had been put forward that the promoters were not a company, but they were incorporated under the Act of 1893, and further powers had been granted to them in 1896, and again last year, when Parliament had granted powers to the company to make a deviation at Waterloo, and to construct subways at Charing Cross, and to raise additional capital of £80,000.

On Wednesday, after hearing counsel, the Committee passed the preamble of the bill.

Yesterday the Committee considered the clauses of the Bill and rejected certain clauses put in by Mr. Freeman, Q.C., on behalf of the Metropolitan Railway Co.

LONDON UNITED TRAMWAYS BILL.

The Committee of the House of Lords, presided over by the Earl of Rosse, on Wednesday inquired into the merits of the tramway extension scheme of the London United Tramways Co. (Ltd.). The proceedings before the House of Commons Committee, when the preamble was declared proved with slight amendment, were reported in *The Electrician* for May 11, p. 106.

Mr. BALFOUR BROWNE, Q.C., for the promoters, said the length of tramways which the company had already constructed, and for which they had obtained Parliamentary sanction, was 21m. 7f. 9c., and the system connected Hammersmith and Uxbridge, Hammersmith and Hounslow, and Kew and Hanwell. The additions now proposed would be in length 17m. 3f. 9c., and would run from Acton to Hanwell—to complete the line from Shepherd's Bush to Uxbridge—and would form an extension from Hounslow to Baber Bridge, from the London-road near Kew, and from Richmond to Twickenham, Hampton, Hampton Wick and Teddington. Practically the whole of the system, except one small piece in Richmond-road, was unopposed. At present the system was worked by horses, but the promoters proposed to use electricity, and intended to construct a large generating station in the Chiswick-road. Before long 10 miles of the system would be worked by electricity, and it was intended eventually so to work the whole of the tramways. Ealing originally opposed the scheme, as well as certain frontagers subsidised by one of the great omnibus companies. But Ealing had so far changed its mind that in the beginning of the present session it had itself proposed a tramway along the very streets in which it had declared that the line of the company would be an obstruction. Thinking, however, that the company's scheme was better than its own, the Council had now withdrawn this bill and was supporting the present proposal, which it had formerly opposed and had been instrumental in getting rejected. It was also hard for the

Digitized by Google

promoters that a scheme which they had presented before the Light Railway Commissioners had been rejected, notwithstanding its approval by all the local authorities on the line of route, owing to the opposition of the London & South Western Railway Co., who were now, singular to say, favouring the proposal, having found out that the tramways contemplated would benefit them rather than the reverse. The nine local authorities affected by the present bill had cast on the promoters onerous responsibilities in the matter of carrying out improvements along the track of the tramway—improvements which would cost the promoters £120,000. The chief petitioners against the bill were the Middlesex County Council, who were, however, affected only in a few cases in which the local authorities had entrusted them with the maintenance of the main roads. He would therefore ask the Committee to allow the County Council to be heard only in respect of the sections of road under their control. One complaint made against the promoters of this bill was that they had bribed the clerks of the District Councils. This was simply not true, as he would prove up to the hilt.

Yesterday (Thursday) the CHAIRMAN said the question of alleged improper payments had first to be dealt with by the Committee. Attention had been drawn to the clause in the petition of the Middlesex County Council, in which it was said "and the promoters have made improper payments to the clerks of certain district councils and others." The Committee were anxious to know who the clerks in question were, and what were the particulars of the charge.

The charges were indignantly denied by the legal representatives of the District Council officials.

Lord R. CECIL, for the Middlesex County Council, said the measure before the Committee was an important one, and the charge made in their petition by the Middlesex Council was also serious and important. What surprised him was the apparent desire on the part of the promoters to avoid a full investigation. The clause of the petition ran :—

"The Company has, with a view to obtaining the consent of various District Boards through whose districts the proposed tramways will pass, taken an active part in the election of the District Councils, and in promoting the election of councillors favourable to the Company, and the Company has also, with a view to influence the inhabitants of the districts traversed by the tramways favourably towards the bill, published and circulated, or have been instrumental in publishing and circulating, a quantity of printed matter of a highly coloured character, calculated to create an extremely distorted and inaccurate view of the scheme and proposals embodied in the bill, and of the manner in which it will affect the districts concerned ; and the promoters have made improper payments to the clerks of certain District Councils and others."

The charge made was couched in general terms, as was usual in petitions. The district principally affected was the district of Teddington, the only other district implicated being Twickenham. The charge was that the promoters had made improper payments. In regard to Teddington an investigation had been made by the Chairman of the District Council, who had reported on the subject. In his report the correspondence between the tramway company and the Council and their officials was given, from which it appeared that, in addition to a sum of £70. 1s. 8d. paid by the promoters to the Council in respect of costs, 200 guineas had been given to the clerk of the Council without the Council's knowledge. This payment was made in respect of a light railway promoted last year by the tramway company, in effect the same scheme as that now before the Committee. The correspondence showed that an agreement had been drawn up between the promoters and the Teddington District Council, and that 200 guineas had been paid to Mr. G. H. Salmons, the Council's clerk, for the work he had performed ; that the chairman of the Council asked that the services so paid for should be specified, and whether it was the fact that a further sum of 100 guineas had been promised when the bill was got through ; and that the company were prepared to pay what was demanded. By request of Mr. Salmons a meeting between representatives of the District Council and the promoters was arranged to investigate the matter. It was stated at the meeting that Mr. Salmon's action had been misinterpreted, and the representatives of the Council held that it had been consistent with a resolution passed by the Council to the effect that the work of the clerk in connection with the agreement between themselves and the tramway company as to road widenings and improvements should be regarded as extra work, and should entitle him to remuneration such as was paid to the officials of other Councils.

The CHAIRMAN decided that the question raised was one to be fought out in a proper court.

Lord R. CECIL urged that the object of the promoters had been to secure the consent of the District Councils, which was as essential in the case of a light railway scheme as it was in the case of a tramway bill before Parliament. It was important, in his view, that the Committee should have an opportunity of ascertaining whether the promoters had conducted their scheme properly.

Mr. W. TAYLOR, Q.C., said this was one of the gravest matters which had ever come under his notice during a 30 years' practice before Parliamentary Committees. His learned friend could not give himself a *locus standi* by making a charge which might render certain district clerks liable to a criminal prosecution. The charges he made were not a ground of *locus*. He would ask what their lordships proposed to do. There was no shadow of doubt as to what the charge was.

Lord R. CECIL said that the Middlesex County Council claimed a general *locus* as being charged with the administration of the affairs of he county, and having before them a case in which it was sought to obtain tramway powers by improper means.

The CHAIRMAN : The Committee cannot go into the question of these libellous charges. I may say we do not see that the allegations made are borne out by the correspondence.

Lord R. CECIL : I regret very deeply that you should think so. He then addressed himself to the question of the *locus standi* of the County Council to be heard against the bill as the chief road authority in the county of Middlesex.

The CHAIRMAN said the Committee would only give the Middlesex County Council a limited *locus*.

Mr. CLIFTON ROBINSON, C.E. (managing director and engineer to the promoters), then gave evidence as to the enormous public advantage which would attend the proposed tramway extensions. He pointed out that the proposed generating station, which would be at Chiswick, would cover 3 acres of land, and would cost something like £150,000. He said that formerly the London County Council had imposed restrictions on the tramway company in favour of the conduit electric system, but they had had reason to change their views, and now favoured the overhead trolley system, as proposed in the bill. Parliament, the London County Council, and all the local authorities were in favour of the proposed system. The cost of the improvements which would be effected by the promoters would be £138,000. In Richmond-road alone the improvements would cost £40,000. The public, when the proposed lines were constructed, would be able to travel from Hammersmith to Uxbridge, a distance of 12 miles, for 6d., the workmen's fare being 3d. The fare from Hammersmith to Hampton Court, also 12 miles, would be 6d. The company had proved by experience at Middlesbrough, Bristol and elsewhere that these fares could be made remunerative. In the event of dispute as to the system of traction to be used, the settlement of the question would rest with the Board of Trade. The electric cars would be palatial, and would cost £1,000 each as against £200 spent on the horse car. The company proposed at once to spend £100,000 on cars. The speed of the cars would not be necessarily limited to 8 miles an hour. The speed would depend on the character of the road. At Middlesbrough they ran at 4, 6, 8, 10, and even 12 miles an hour. It would depend upon the Board of Trade what the speed should be along Richmond-road.

Other evidence in support of the bill having been given, the Committee adjourned

MERSEY RAILWAY BILL.

This bill, which authorises the Mersey Railway Company to adopt electric traction and which provides for the formation of a joint committee for working the Mersey and Wirral Railways, came before the unopposed Bill Committee in the House of Commons on Wednesday, and was ordered to be reported for third reading.

SOUTH LANCASHIRE TRAMWAYS.

The Bill of the South Lancashire Tramways Co., which has passed through all its stages in the Commons, came on Monday before a Select Committee of the House of Lords, presided over by Viscount Portman. The proceedings before the Commons Committee were reported in *The Electrician* for May 4, page 62.

Mr. WEDDERBURN, Q.C., said the promoters were all gentlemen largely connected with the commerce of the district, and there was no question of their ability to carry out the scheme. None of the local authorities opposed it, and they had settled with the London & North-Western Railway Co. and the other four railway companies in the district—the Great Central, the Lancashire & Yorkshire, the Wigan Junction Railway, and the Liverpool, St. Helens & South Lancashire. There was a petition of 30 ratepayers and inhabitants of Ashton-in-Makerfield, and he contended they had no *locus standi*. The local authority did not oppose, and there was a clear rule that individual ratepayers could not oppose against the decision of the local authority. The Wigan & District Tramways Co. also opposed. The petitioners objected to any authority whatever being given to the South Lancashire Company "to construct tramways in Wigan or the neighbourhood, or to the company interfering with the tramways of the petitioners or with the natural extensions of such tramways." That paragraph appeared to be founded on the misconception that the Wigan Tramways Company had some prescriptive right to get more than they had already got. Of course, they had no such right. They would apply for something, and get it if they could ; but when they went before Lord Jersey they would find themselves in a great difficulty if opposed by the local authority. Then another paragraph in the petition alleged that their scheme was not so laid out as to give to the public the facilities desired, and that it was so overburdened by the terms agreed with the various local authorities, that it must be over-capitalised, and could not be expected to make such a return as would enable the company to give a good and satisfactory service. But, he urged, the Wigan Company had nothing to do with this. So long as they opposed because they were promoting now a competitive scheme they had the right to be heard ; but they had no right to interfere with the terms that had been agreed. The only other petition was that of the Leeds & Liverpool Canal Co., which dealt with the reconstruction of bridges over the canal ; but this was simply a question of clauses.

The CHAIRMAN said the Committee could not alter the *locus* of the petitioners from Ashton-in-Makerfield.

Mr. WEDDERBURN then asked that the Wigan Company should be limited in their *locus*.

Mr. LEWIS COWARD, for the Wigan Company, contended they had the right to be heard against the preamble of the bill. When the bill entered the House of Commons there were no less than 61 clauses for the protection of the local authorities, and when it emerged these had been enormously increased. It was part of his objection that the promoters had burdened themselves with a sum of £70,000 to £100,000 so that there would be a very tight squeeze with the estimates. It should be able to show the onerous terms made with the authorities as to the lighting of the streets, the widening of the roads and so forth. It was difficult to say whether the promotors would ever be able to construct these tram-

Digitized by Google

ways over the enormous length of route; then the consent of the local authorities had been obtained by arrangements of the most unheard of description.

Mr. BALFOUR BROWNE, Q.C. (for the promoters), said the bill had not been modified in any way. The clauses were entirely for the protection of the local authorities, and if the terms were onerous it was they who had to bear them, and not the Wigan Company. They had promised to light the roads along which their tramway passed by electricity. How could that affect the Wigan Company? He admitted they should be heard as to railways affecting their system, but he did not know what they had to do with the other tramways.

The CHAIRMAN said the Committee considered the opposition could go into the details of the bill.

Evidence was then called.

Mr. J. E. WALLER (Messrs. Kincaid, Waller & Manville) said his firm, in conjunction with Messrs. Preece & Cardew, were engineers to the promoters of the bill, and he personally had laid out the system now under consideration. The original length of the system was 67½ miles, but it was now 63¼ miles. It passed through a very populous neighbourhood and joined up a number of considerable towns between St. Helens, Bolton, Wigan, Leigh and Manchester.

Mr. BALFOUR BROWNE at this point said he had agreed with Mr. Coward that they would give up their line No. 14 or take powers to construct it and by a clause in the bill transfer these powers to the Wigan Company. They both desired to get to Ashton-in-Makerfield, and they (the promoters) could get there by line No. 15 and the Wigan Company by No. 14, or by their own projected light railway if the Commissioners passed it.

Mr. WEDDERBURN said in that case there was no opposition to the preamble of the bill, as the petition of the Leeds & Liverpool Canal Co. only referred to clauses.

After evidence had been heard on behalf of the Canal Company as to the bridges,

Mr. PEMBER, Q.C., for the Wigan Tramways Company, said their case was finally settled. The arrangement was that one of their light railways, parallel to No. 15 in the present bill, which they were proposing before the Commissioners, would not be persevered with, and the promoters of the present bill on their part would not proceed with their tramway No. 14 or anything like it, until November, 1902. By that time the Wigan Company would make up its mind as to whether they would construct the tramway which was wired to No. 14.

The CHAIRMAN then stated the Committee were of opinion that the new clause as to the Leigh bridge was sufficient, with the proviso that the South Lancashire Tramways Co. should pay any additional cost of altering necessitated by the widening of the bridge.

The Committee agreed to insert new clauses giving further protection to the Canal Company, including a clause ensuring that the South Lancashire Tramways Co. should be liable for any subsidence in the widening of the bridge. The preamble having been agreed and the clauses considered, the bill was ordered to be reported as amended.

SOUTH-EAST METROPOLITAN TRAMWAYS BILL.

The South-Eastern Metropolitan bill, which provides for the electrical equipment and operating by electricity of the tramway running from Greenwich to Catford, came on Tuesday before the Unopposed Bill Committee of the House of Lords. There was some difficulty in operating this line by electricity owing to its proximity to the Royal Observatory, but the promoters succeeded in satisfying the requirements of the authorities in respect to insulation. The opposition of the County Council asking for a veto on the system to be employed having been withdrawn, the bill now passed with amendments, and was ordered for report.

The measure has already passed through the House of Commons for third reading.

SHEFFIELD TRAMWAYS BILL.

The preamble of the Various Powers Bill of the Sheffield Corporation (which has already passed the House of Lords, and which provides for a considerable extension of tramways, to be eventually operated throughout by electricity), was on Tuesday last, after hearing evidence, approved by the House of Commons Committee presided over by Lord E. Fitzmaurice.

PRESTON TRAMWAYS.

On Monday the Select Committee of the House of Commons on Police and Sanitary bills, presided over by Lord E. Fitzmaurice, considered the bill of the Preston Corporation, by which, among other matters, powers are asked to reconstruct for the purposes of electrical traction the existing tramways in the borough, and to make new tramways, 11½ miles in length, also wholly within the Corporation boundaries. The bill has already passed the Upper House. As originally introduced it was sought to obtain powers under the bill to construct tramways outside the borough to Walton and Fulford, but these outside tramways were struck out of the scheme by the House of Lords.

Counsel having introduced the bill,

Mr. C. M. MACEY, C.E., said he was consulting engineer to a number of corporations. The original estimate for tramways had been £140,000 odd, but, by the omission of the outside portion of the scheme, the estimate had now been reduced to £113,000. In addition to that sum, however, £50,000 would be required for the electricity generating station, rolling stock, and car depôts. The cost of the generating plant, with transforming apparatus, would be £23,320. The overhead system would be used.

The Committee decided to pass the preamble of the bill so far as it related to tramways.

HASTINGS TRAMWAYS BILL.

This bill, which provides for the incorporation of a company, with a capital of £300,000 and borrowing powers of £150,000, with power to construct some 10 miles of tramways in the borough of Hastings, to be worked by electricity on the overhead system, having been reported to the House of Lords, now stands for third reading. The bill has passed through the House of Commons. The proposed tramways will be worked in connection with the authorised Bexhill and St. Leonards light railway, which the company is empowered to take over and construct.

PROVISIONAL ORDER TRANSFERS.

In the House of Commons last evening Mr. LOUGH asked the President of the Board of Trade whether he would explain why the Board of Trade insist on all transfers of electric lighting orders to companies being in a standard form, and refuse to allow variations required by local conditions, also on what grounds they refuse to allow the insertion of agreed provisions for the reduction of the maximum price either for public or private lighting; and whether he would consider the desirability of relaxing these departmental rules.

Mr. RITCHIE: The Board of Trade do not consider that deeds of transfer under electric lighting orders should contain any provisions other than those which are consequential on the substitution of a company for a local authority as undertakers. To go beyond this is to provide, under the colour of a mere deed of transfer, for matters which really require the approval of Parliament. Transferees are accordingly placed in exactly the same position with regard to price as they would have been had they obtained the order originally. The price for public supply is left to agreement, or, failing agreement, to arbitration. The price for private supply is not specifically fixed, but is left (as in the order) subject to a maximum, which may be revised periodically by the Board of Trade on the representation of the local authority. I see no reason for altering the existing practice of the department.

THE PACIFIC CABLE.

Sir EDWARD SASSOON asked the Secretary of State for the Colonies whether the Pacific Board had now definitely decided to commence the laying of their cable.

Mr. CHAMBERLAIN: The various Governments interested have accepted the recommendations of the Pacific Cable Committee, and tenders for the establishment of the cable will be called for immediately.

CITY OF LONDON ELECTRIC LIGHTING CO.'S BILL.

Royal Assent was given to this bill on Tuesday.

LEGAL INTELLIGENCE.

Workmen's Compensation.

In the House of Lords on June 26, before the Lord Chancellor and Lords Morris, Shand, Davey, Brampton and Robertson, an appeal action, "Powell *v.* Main Colliery Co. (Ltd.)," raised an important question under the Workmen's Compensation Act, 1897. The appellant was a miner who had been injured in the course of his employment, and had sent a letter to his employers within a week or two of the accident saying that he would claim compensation, but did not actually file his claim in the county court until nine months after the accident. Respondents pleaded that the action was consequently barred under the act, the claim not having been made within six months as there stipulated. The county court judge declined to accept this plea, and awarded 13s. 11d. weekly as compensation during total or partial incapacity from work, but the Appeal Court reversed his decision, and held that the notice of claim was not the letter but the filing of the application in the county court nine months after the accident.

The LORD CHANCELLOR said that the accident, which was the basis of this action, occurred in December, and in May appellant gave notice of it and made a claim for compensation until he was able to resume work. This claim was clearly made within the six months specified by the act. The sole argument urged was that the claim must be a claim in some form of legal proceedings. He could not, however, agree, nor did he think that such was the intention of the legislature. There was nothing in the statute to lead to the conclusion that the words "claim for compensation" were used in the technical sense suggested. He therefore held that the judgment of the Court of Appeal was wrong, and that the county court judge's decision must be restored. The act contemplated that no lawyer should be employed at all, and that the man who was injured should himself make his claim and go to the county court if it were refused. If Parliament had intended anything like a technical application of the words employed it would have said "plaint," "suit," or "writ," but it had not done so. This was a very important case, but undoubtedly the county court judge was right, and he moved that his judgment be restored.

Lord MORRIS took a different view from that of the Lord Chancellor, and was of opinion that respondents were right in their contention that a claim for compensation meant the initiation of proceedings by a request for arbitration.

The other law lords agreed with the judgment of the Lord Chancellor, and the appeal was consequently allowed by five to one, with costs.

Machray v. P. C. Middleton & Co.

The record was closed in the Aberdeen Sheriff's Court last week in this action, which was brought by Mrs. Frances Machray or Cameron and the trustees of the late John Cameron against Messrs. P. C. Middleton & Co.

Digitized by Google

(Ltd.), Union-street, Aberdeen, to interdict defenders from carrying on the Cults electricity supply station in such manner as to create a nuisance. Pursuers aver that when the Cult works are in active operation at night the engines make an incessant throbbing noise, causing tenants and their families serious injuries consequent on the loss of sleep, disturbance, and otherwise. Defenders aver that there are other industrial works in the neighbourhood, and the operations complained of are not an excess of defenders' rights as contained in the titles of the feu, and that they do not create a noise amounting to a nuisance.

Acetylene Illuminating Co. (Ltd.) v. Midland Acetylene Patent Syndicate (Ltd.)

In the Chancery Division, on Wednesday, before Mr. Justice Farwell, this case was down for hearing.

Mr. MOULTON, Q.C., who appeared for the plaintiffs, said defendants had not put in an appearance. The action was one for infringement of patents for improvements relating to the manufacture of carbide of calcium for the production of acetylene gas under the influence of the tremendous heat of the electric arc. The defendants had undoubtedly infringed, but as soon as they were detected they promptly died. As defendants did not appear he asked for judgment against them, and for a certificate that the patent had been called in question in this action.

Mr. JAMES SWINBURNE said he had studied plaintiffs' patents relating to the manufacture of carbide of calcium. The invention was both novel and useful.

Mr. MOULTON then put in answers to interrogatories as to the infringement, and his LORDSHIP gave judgment for plaintiffs, with costs. He granted a certificate as asked, and directed an inquiry as to damages.

Joseph v. Williamson & Joseph (Ltd.).

An application on behalf of the second debenture holders in this failure came before Mr. Justice Cozens-Hardy on Saturday for judgment. Plaintiff was holder of second mortgage debentures, and was suing on behalf of himself and other debenture holders of the same issue. The defendants were trustees of a trust deed for securing the first mortgage debentures.

Mr. Justice Cozens-Hardy made the order as asked, which was for an inquiry into the amount of the liability of the company to the second debenture holders.

River Plate Electric Light & Traction Co. (Ltd).

Mr. Justice Cozens-Hardy on Tuesday allowed the petition of Messrs. Glyn Mills, Currie & Co. for the winding-up of this company to stand over until next sittings.

Re Isle of Man Tramways & Electric Power Co. (Ltd).

In the Manx Chancery Court on Wednesday an order was made for the compulsory liquidation of the Isle of Man Tramways & Electric Power Co. (Ltd.). The order was not opposed by the new board of directors, who had been unable to make arrangements to place the company in a satisfactory financial position. Mr. W. H. Walker was appointed liquidator.

Gutta-Percha Corporation (Ltd.).

In the Chancery Division on Wednesday an order to wind up the Gutta-Percha Corporation (Ltd.) compulsorily was made by Mr. Justice Cozens-Hardy on a shareholders' petition. A resolution to wind up voluntarily had already been passed for reconstruction, which proved abortive. The granting of the order by Mr. Justice Cozens-Hardy was accompanied by some severe remarks upon the management of the company since its incorporation.

MUNICIPAL, FOREIGN & GENERAL NOTES.

Aberdeen.—A lengthy and lucid report on the system of charging for electric current has been prepared by the city electrical engineer (Mr. J. Alex. Bell). At present the maximum demand system of charging is in operation (6d. per unit for the first hour's maximum demand and 3d. after for lighting, and 3d. and 1d. for power), and Mr. Bell favours its retention. It had been urged (he reports) that the present initial price of 6d. per unit was unduly hard on those shopkeepers who were short-hour consumers, but it was on account of those short-hour consumers that the Council had been forced to expend a large amount of capital on new plant. All future reduction of charges for some time to come Mr. Bell considers should be on the lower scale, and the initial price of 6d. should be retained. Mr. Bell considers the adoption of the maximum demand system has tended largely to the present flourishing condition of the undertaking; 62 per cent. of the consumers benefited by the rebate system during the year. In 1899 the units generated amounted to 655,479, of which about 600,925 were sold to consumers.

Asylum Lighting.—The managers of the Poplar and Stepney Sick Asylum have invited Mr. F. J. Warden-Stevens to state his terms for preparing an electric lighting scheme for the asylum.

The report of Mr. D. Mackenzie, chairman of the Edinburgh Electric Lighting committee, as to the proposed cost of an electric lighting installation at the Fife and Kinross Asylum, Springfield, has been issued. The capital expenditure is estimated at £3,150, and an annual income of £350 for 30 years would meet interest, working expenses, and total cost. The present cost of gas lighting is about £400 per annum. Acting upon this report, the Lunacy Board have decided to obtain estimates.

Barking.—The question of altering the charges for electric current was discussed at the last meeting of the Council. Mr. Marriott moved that the resolution passed in April to abandon the maximum demand system of charging be rescinded, and, as the voting was equal, the chairman gave his casting vote against the motion, and the April decision stands.

Bath.—The Works committee have reported that they are not in a position to suggest any alteration that would appreciably diminish the cost of the electricity works, but recognise that if the four old engines are replaced by new ones, a considerable saving in the cost of fuel would be effected. At the meeting of the Electricity committee last week, it was stated that the laying of new mains had made considerable progress. A discussion followed as to the best means of increasing the number of private customers. It was resolved that local wiring contractors be required to have their business premises or private houses wired and connected to the mains; any wiring contractor so connected, who engages a canvasser to be employed for canvassing for electric lighting, to be allowed a commission of 1s. for every 16 candle-power lamp wired, according to the Corporation regulations, by such contractor, and connected by the authority in private houses during each quarter. On the motion of Mr. Bush, it was agreed that a report be presented on the possibility of the committee arranging to put in fittings on the understanding that they should be paid for at so much per quarter, or a certain sum added to the charge per unit.

Batley.—Sanction to a loan of £22,231 for electric lighting and traction has been applied for.

Beckenham.—Sanction to a loan of £7,000, re-payable in 10 years, has been obtained by the Council for wiring premises in the district. A provisional agreement has been entered into with the British Insulated Wire Co., and the consulting engineer (Mr. R. P. Wilson) has been retained to supervise the work at a fee of 2½ per cent. on the actual amount expended.

Belfast.—The electrical and gas undertakings are in future to be under the control of one committee—the Lighting committee. The relations between the old electric and gas committees were always of the most harmonious character, but all the same the amalgamation seems a retrograde step.

Bethnal Green (London).—An electric lighting scheme, estimated to cost £96,000, is at present under consideration by the Vestry. Mr. R. Hammond is consulting engineer.

Bexhill.—The Council have unanimously decided to apply for sanction to borrow £7,772 for electricity supply extensions as recommended by their consulting engineer, Mr. A. H. Preece.

Broughty Ferry.—The scheme for the erection of electricity works has been dropped by the Burgh Commissioners for the present.

Bury (Lancs.).—The accounts of the electricity department for the year to March 31 have been issued. The revenue, including £3,033. 5s. for the supply of current for private consumption and £473. 19s. 10d. for public lighting, amounted to £3,582. Generation expenses came to £901. 5s. 5d., and with distribution charges, management expenses, &c., the total annual expenditure was £1,753. 3s. 4d., leaving a gross profit of £1,981. 19s. 11d. After paying interest (£900. 11s. 1d.) and sinking fund instalment (£807. 14s. 2d.) there was a net profit of £183s. 14s. 8d., which has been transferred to the general rate account. Last year there was a deficit of £336. The total capital expenditure to date is £34,395, and borrowing powers of £15,605 have not yet been exercised. There were 228,546 units of current generated, 161,469 units were supplied to private consumers, 45,505 units to public lamps, 6,421 units to contract, and 6,939 units used on the works. There are 193 consumers, representing an equivalent of 14,733 8 c.p. lamps connected, an increase of 54 consumers and 4,458 lamps during the year. The number of public arc lamps is 31, an increase of 13 over 1899, and the total maximum supply demanded was 197kw.

Cardiff.—The report of the expert (Mr. H. R. J. Burstall) on the 300kw. Ferranti alternator, which was the subject of the recent action between the Corporation and Messrs. Ferranti, has been presented. Mr. Burstall states that the alternator has now been finished and adjusted to his entire satisfaction, and as the whole of the work decided to be done under the terms of settlement had been carried out, the machine was ready to be taken over by the Corporation. The resident engineer (Mr. N. Applebee) also reported that the engine worked well and satisfactorily, and could be taken over now. The Lighting committee consider the reports satisfactory, and have decided to take over the alternator.

Carlisle.—The electric tramways were officially inspected by Mr. A. P. Trotter, on behalf of the Board of Trades last week, and the lines were opened for traffic on Saturday.

Chambley (Quebec).—The Chambley Water Power Co. are stated to be about to add very largely to their present plant, in order to develop additional power at the St. Terres Rapids. The Chambley

Digitized by Google

works have at present 7,800 H.P. available, and the extensions now contemplated will increase this to 20,000 H.P. A portion of the extensions are nearing completion, and the whole will be finished at the end of next year.

Charges for Electric Current in London.—The County of London Company have issued an opportune notice relating to charges for electric current in their districts (St. Luke's, Clerkenwell, Eastern and Western Holborn, Putney, Roehampton, Wandsworth, Clapham, Streatham, and Tooting). The circular states that, notwithstanding the heavy increase in the costs of production due to the rise in the price of fuel, the company are not advancing their charges for electricity supply—viz., 3d. per unit for all current in excess of 1½ hours' average daily consumption of the maximum demand, the first 1½ hours being charged at 7d. per unit. Current for power is supplied from the company's continuous-current or two-phase mains at a uniform rate of 2½d. per unit.

Chesterfield.—Owing to the brisk demand for electric current for private lighting, the Electric Light committee have decided to let the question of public arc lighting stand over for the present as the capacity of the existing plant is only equal to the demand for private consumption.

Companies to be struck off Register.—Notice is given that the following joint-stock companies will be struck off the register unless cause is shown to the contrary within three months:—

Battery & Motor Co.	Gravier Dynamo Syndicate.
Brit. Assoc. of Medical Electricians.	Highgate & Finchley Tramways Co.
Canton (Waipori) Mining & Electric Power Co.	Improved Incandescent Electric Lamp Co.
Capital & Counties Elec. Supply Co.	Kerbey Bowen.
Colbridge Electric Lighting Co.	Light Railway Contract Co.
Cruto Incandescent Lamp Agency.	Llandudno Electric Supply Co.
Electric Free Wiring Syndicate.	London Electrical Carriage Co.
Electric Meter Co.	London Electrical Coupé Co.
Electric Racing Horse Maze (Pioneer) Syndicate.	London Electrical Van Co.
Electrolytic Separation Syndicate.	London Health Electrical Institute.
Eliéson Lamina Accumulator Co.	Maxim Motor Co.
European Electric Finance Co.	North London Electric Supply Co.
	Peerless Accumulator Syndicate.

Cork.—An inquiry has been held here into the application of the Corporation to borrow £20,000 for electric lighting. The Cork Electric Tramways & Lighting Co. has been authorised by the County Council to extend their mains to Douglas and Ballintemple.

Crewe.—The Council on Tuesday considered a recommendation from the Electric Lighting committee to apply for sanction to borrow £10,000 further for extending the electric lighting area. Mr. Jervis objected to further expenditure until they had some results from their present outlay of £27,000. "If electric lighting was going to be a loss in Crewe he did not see why they should increase that loss by extending their area"—not very conclusive reasoning, but it determined the Council to refer the report back with a recommendation that the extension scheme be not proceeded with.

Crieff.—The Council is to consider at it next meeting an application by the North British Electricity Supply Co. for consent to a provisional order.

Croydon.—The salary of the Borough electrical engineer (Mr. T. H. Minshall) has been increased to £450 per annum, rising by annual increments of £25 to £600.

Darlington.—The Council and the Imperial Tramways Co. are at loggerheads over the proposed scheme of light railways of the latter. The Council have notified the Light Railway Commissioners that if the company are not prepared to carry out the scheme in its entirety as proposed by the company and supported by the Corporation at the inquiry before the Commissioners in August last (with the modifications subsequently agreed to), the Council will themselves consider the expediency of making an application for a new order at an early date.

Dorking.—Offers are to be invited for the Council's provisional order.

Dublin.—Readers of the *Daily Nation*, a leading Dublin print, were alarmed on Tuesday to learn that the city on the Liffey was in "Cimmerian gloom." What is described as an utter collapse of the Corporation's electric light undertaking proves, however, to be a very small affair indeed, and gives us wonder how the newspaper man came in possession of his "facts." Shorn of all its journalistic trimming, what really occurred was that through a fault in one of the old rubber arc cables the public lighting of one side of a street was affected. This fault has not yet been remedied, and one side of the street is accordingly still in "Cimmerian gloom." No private lighting was in any way affected.

Dundee.—A hitch occurred early in the week in connection with the delivery of the cars for the Perth-road route of electric tramways. Five cars were despatched from Preston by Messrs. Dick, Kerr & Co. on Saturday last and were due to reach Dundee on Sunday, or, at latest, on Monday. On reaching Hellifield, a junction on the Midland Railway 60 miles south of Carlisle, the cars were detained. The cause of delay was that the height gauge of the English railways is somewhat higher than that of the Scotch lines, and the cars could not, resting on the trucks on which they were loaded at Preston, get beyond Carlisle. When the cause of delay was ascertained, some fear was felt that the cars could not arrive in time for the Board of Trade inspection which was due to take place yesterday (Thursday). Mr. Tittensor, burgh electrical engineer, of Dundee, and Mr. Dean, Messrs. Dick, Kerr & Co.'s representative, at once came south and were able to extricate the cars and get them to Dundee, where they arrived safely yesterday morning in time for the Board of Trade inspection, and the line was duly passed.

Eccles.—Messrs. Medhurst, Kitchin & Page have been appointed consulting electrical engineers in connection with the Corporation electric tramway scheme.

Electric v. Gas Lighting.—The following communication from Mr. Bernard M. Drake appeared in the *Daily Express* of 29th inst.:—

My attention has been called to an article in your paper of June 29, which has evidently emanated from someone who has a rival axe to grind. Now that gas has been raised in price and electric current is being produced on a larger scale, those interested in gas are finding the competition more serious, but they may rest assured that electric light, like everything else, will advance on its merits, and that no misleading statements such as those contained in your recent issue are likely to retard its progress. As a matter of fact an ordinary incandescent lamp, if of good quality and made with a good vacuum, can be grasped with the naked hand for any length of time. There are doubtless bad electric lamps as there are bad petroleum lamps, and, I might add, bad gas incandescent mantles, and surely it is not fair on this account to condemn the whole industry. Although I will not go so far as to say it is impossible to produce a fire by electric light, the fire insurance statistics show that it is infinitely safer than any other form of illuminant.

"Faraday House Journal."—The June issue of the Faraday House *Journal* is to hand. In addition to the usual notes several articles by Faradians are contributed. A gossipy article, entitled "Faradians at the Front," gives an interesting record of a number of the young men now serving with the troops in South Africa.

Glasgow.—The accounts of the tramway department, which were abstracted in our last issue, were approved by the Corporation last week. The recommendation in favour of increasing the salary of the tramways manager (Mr. John Young) from £1,250 to £1,400 per anuum, and that of the chief engineer (Mr. Wm. Clark) from £450 to £500 per annum were approved.

The agreement between the Corporation and the Burgh of Govan with reference to the conversion to the overhead trolley system of the Govan tramways, which are to be worked in conjunction with the Glasgow tramway system, was approved at the Corporation meeting last week. The lease is for 21 years after termination of existing lease in 1914. The Corporation of Glasgow are to carry out the work of converting the lines (including renewal of permanent way, laying ducts and cables, erection of overhead work, &c.), finding the capital therefor, and to undertake to maintain the whole lines, cables, and overhead construction, and leave them in good working order at the termination of the extended lease; but the lines and all overhead electrical construction in the streets to remain the property of the Govan Commissioners during the whole period of the extended lease. The Corporation to continue to pay interest and sinking fund upon the capital are expended by the Commissioners under the existing lease till the termination of the extended lease, and the Corporation are also to pay all owners' assessments on the Govan lines as from the date when these are worked electrically.

Gloucester.—Mr. A. Dickinson has been appointed consulting engineer to advise the Streets committee in its negotiations with the tramways company for the introduction of electric traction.

Halifax.—The accounts of the electricity department for the year to March 31 have been issued and show a total income of £16,069. 6s. 10d., compared with £8,957. 8s. 6d. for the previous year. Expenditure reached £7,067. 15s. 1d. (compared with £4,330. 1s. 5d.), leaving £9,001. 11s. 9d. (against £4,627. 7s. 1d. last year) to meet interest, sinking fund instalment, &c., amounting to £3,512. 10s. 3d. The net profit was £5,489. 1s. 6d., of which £2,000 has been transferred to the district fund and the balance (£3,489. 1s. 6d.) to renewal account. The total capital expenditure was £91,085. 18s. 1d., an increase of £18,616. 5s. 8d. during the year. There were 515 customers, representing an equivalent of 45,403·8 c.p. lamps connected, compared with 381 customers and 32,020 last year. The number of units sold amounted to 1,371,333, and of this number 1,289,210 units were supplied to private consumers by meter, 82,123 for public lighting, and 20,131 were used in the works. The total number of public lamps is 42, an increase of 10. Electric current was supplied at 5d. per unit for lighting and 2d. for power, subject to discounts. Current for tramway working (895,024 units) was supplied at 2d. per uuit.

Havana (Cuba).—Notwithstanding the occupation of Cuba by the United States, the country continues in an undeveloped state. The only public works of importance which show any marked degree of progress are the tramways of the city of Havana, which are now being considerably extended and converted to electrical lines.

Digitized by Google

Hastings—The accounts of the Electricity department for the year ended Dec. 31 were presented to the Council last week. The profit on the year's working was £537. 11s., and the capital expenditure £78,916. 2s. 4d. The report was considered satisfactory, especially as it was anticipated that a loss would be made on the first year's working by the Council. The Waterworks-road electricity station is to be discontinued. Extensions of the lighting mains, estimated to cost £1,232, have been authorised.

Hereford.—The accounts of the first year's working of the electricity department were presented and approved at the meeting of the Council last week. The gross profit was £268, but after allowing for interest and sinking fund there was a deficit of £532.

Heston and Isleworth.—Edmundson's Electricity Corporation, who are erecting electricity works at Twickenham, have offered to supply electric current in these districts.

Ilkeston.—An application of the Council to borrow £18,271 for electric lighting has been deferred by the Local Government Board until a site for a generating station has been acquired. The Board of Trade have consented to the application of the Council to postpone for twelve months work in connection with their proposed tramway scheme.

Imports of Electrical Goods into the United Kingdom.—The accounts relating to the trade and navigation of the United Kingdom show that the value of electrical goods and apparatus imported during June was £86,171, against £78,350 in preceding month. The total for the six months ended June 30 was £420,253.

Inverness.—The Council have decided to abandon their electric lighting scheme. The matter has been before the Council for about 18 months and was originally taken up in order to keep out private companies. An electric lighting scheme was drawn up by the Council's consulting engineer (Mr. E. G. Craven), late of the Brush Company, whose tender for the supply and erection of plant was recommended for acceptance. Various disputes arose in connection with these tenders with the result that the Council have recently indulged in several acrimonious debates. However, matters were brought to a head on Monday when a ratepayers' petition was presented, asking the Council to abandon the whole scheme and allow a private company to supply what demands there might be for electric current. The payments to date on account of the project amount to over £1,100.

Leamington.—The directors of the Midland Electric Light & Power Co. have refused the offer of £17,000 made by the Corporation for the purchase of the company's undertaking. The position in regard to electric lighting matters in this town is complicated, as both the Corporation and the company are in possession of provisional orders, but the Corporation order lapsed if terms of purchase were not arranged by 12th inst. We are informed that the Corporation will not take any further action in the matter.

Leyton.—An inquiry has been held into the application of the Council to borrow £7,388 for electric lighting extensions. The application was supported by the clerk (Mr. R. Vincent) and the electrical engineer (Mr. F. Harman Lewis). There was no opposition.

Light Railway Orders.—The Board of Trade have, after modification, confirmed the Highbridge, Wedmore and Cheddar Light Railway order.

The Light Railway Commissioners have submitted the Nuneaton and District Light Railway Order to the Board of Trade for confirmation. Objections by Aug. 3.

The Rhyl and Prestatyn Light Railway Co. have notified Rhyl Council that they hope to have their light (electric) railway scheme complete by April 1 next.

Strenuous opposition is to be offered to the Swansea Corporation light (electric) railway scheme by the Swansea Improvements and Tramways committee.

The Board of Trade on Wednesday considered the order for the construction of light (electric) railways from Colne to Trawdon and from Colne to Nelson and Barrowford. Clause 13 empowered the Corporation to supply electricity to the promoters of the railway, but Sir Courtenay Boyle said he did not consider that any Light Railway order could give such a power, and the clause was struck out. Another question arose on the clause giving the Corporation of Burnley power to work and maintain the light railways granted by any of the three orders, but it was agreed to postpone consideration of the clause till the town clerk of Burnley had the opportunity of appearing. For the promoters, Mr. Wedderburn applied to increase the authorised capital of the company to £103,000, with borrowing powers of £36,000, as the price of labour and material had increased since the estimates were framed. The chairman sanctioned the increase, and Sir Courtenay Boyle said he would report on all the orders to the Board of Trade.

London County Council.—At Tuesday's meeting £53,837 was loaned to Fulham and £8,580 to Islington for electricity supply works. Shoreditch have applied for £26,000, but the Finance committee reported that sufficient information had not been supplied to justify the borrowing of £4,095 of this amount, and therefore recommended that a loan of £21,905 be granted. This was agreed.

Lyndhurst.—The Parish Council have expressed approval of a scheme for the erection of electricity works, and also for the construction of an electric tramway from Lyndhurst to the railway station. The consulting engineer for the scheme is Mr. C. J. Wharton.

Malton.—*Correction.*—In our issue of July 6 we stated that an agreement had been entered into between the Malton Council and "the Northern Electric Supply Association." This should have been "the Northern Counties Electricity Supply Co. of Newcastle-on-Tyne," who have obtained a provisional order for Malton.

Manaos (Amazonas).—The Manáos Railway Co., an American syndicate, has recently constructed an electric railway here, of a total length of about 14 miles, at an outlay of from £120,000 to £150,000. The rolling stock consists of 22 passenger cars and 15 waggons for sand, luggage, &c. There is a good and frequent service of cars. The company's concession is for 99 years, and includes similar enterprises within the city during that time. On the lapse of the concession the property reverts to the Government. The company receives an annual subsidy of 200 contos of reis (about £6,500) from the State Government.

Manáos is extremely well lighted by arc lamps, and many of the private houses have electric light. This plant was first installed by an American syndicate, and subsequently purchased by the State Government, to whom it now belongs.

The telephone is making progress. The Empresa Telephonica Manáos has a capital of 220,000 milreis. The number of subscribers is: Public offices, 47; private houses, 168.

Middleton.—An agreement has been entered into with the British Electric Traction Co. for the supply of electric current for the electric tramway which is being constructed from Oldham through Middleton to Manchester. The Council have received sanction to a loan for the erection of electricity works.

Motherwell.—Sanction to borrow £30,000 for electric lighting has been received by the Burgh Commissioners.

Newington (London).—The salary of the resident electrical engineer (Mr. J. R. Blaikie) has been increased from £250 to £300 per annum.

Newport (Mon.).—The Corporation have authorised the Tramways Committee to accept tenders for rails and fish-plates for the Corporation-road electric tramway route, and Ald. Moses and two other members of the Electricity committee have been added to the Tramways committee to assist in deciding as to the most suitable form of electric traction.

Norway.—A report on the trade of Norway for 1899, from Mr Consul-General Dundas states that at Arendel a German company had subscribed £50,000 capital for electrical and other engineering developments including calcium carbide works. A calium carbide factory has also been established at Kragerö, and other industrial enterprises are utilizing water-power-generated electric power. A great development in this utilization of the waters of the country is a feature of the moment, a miscellaneous array of industrial undertakings seeking the advantages which this cheap motive power offers. The electricity supply works of Fredrikshald are now completed and current is available for light and power. In the Frederikstad district the Kellner-Partington Paper Pulp Co. has erected two extensive power stations at the river side, a carbide factory, an electric railway, and other mechanical works. The two stations are equipped for an output of 2,000 H.P. and 5,000 H.P. respectively, these units being employed in the manufacture of calcium carbide; 1,200 H.P. is utilised in the generation of current for electric light and power, and so great is the demand for current that the larger of the two stations is already being extended, so that it may house a plant of double the present capacity, room being even then available for a further extension up to 24,000 H.P. Messrs. Schuckert & Co., of Nuremberg, are large shareholders in this undertaking. Extensive calcium carbide works are being erected at Skiensfjord, where this new industry will be carried on on a very extensive scale. The municipal authorities of Stavanger have recently acquired waterfalls within a short distance where plant will be installed for generating current for light and power to the extent of about 1,700 H.P.

Nottingham.—The accounts of the Electricity department for the year ended March 31 have been issued. The total receipts amounted to £18,419. 17s. 5d., and the annual expenditure to £8,746. 5s. 3d., leaving a gross profit of £9,673. 12s. 2d. After paying interest on loans, sinking fund instalment, and applying £2,000 in aid of general district rate, the balance (£151. 15s) has been carried forward. The total expenditure to 31st March was £161,097. 15s. 2d., an increase of £38,704. 16s. 3d. during the year. The number of units generated is estimated at 1,603,579, and of this number 1,470,280 were supplied to private consumers, 20,904 for public lighting, and 16,180 were used on the works. The number of public lamps is 15, and the total maximum supply demanded was 1,578kw.

Oran (Algeria).—This town is now in possession of an excellent service of electric tramways, which is made the most of by the inhabitants. The country is excessively hilly, and the tramways have proved a boon.

Digitized by Google

Plymouth.—The National Telephone Co. has obtained the consent of the Council to put their wires underground.

Porto Rico.—Excellent opportunities prevail in this newly-acquired territory of the United States for the establishment of electric railways in the interior towns, water power being abundant and easily available. Many plans are already being prepared for the construction and equipment of these inland lines, the working in all cases to be by electricity. A mountain range traverses the island from end to end, and the numerous streams which abound in these mountains present no engineering difficulty in their concentration. There is only one railway on the island consisting of four sections. The concession which was originally granted to establish the railway throughout the island has lapsed, and the United States authorities have refused to recognise its further validity. New roads are being built and a good field for electrical enterprise will shortly present itself. There is already a successfully working electrical lighting installation in the city of Ponce, the capital of the company working the project being £10,000, all locally subscribed. The cash dividend for 1899 was 22½ per cent.

Presentation.—On Monday the staff of the Brush Co., at Loughborough, made a presentation of a recording barometer and a travelling clock to Mr. F. S. Ransome on the occasion of his marriage. The presentation was made by Mr. F. E. Andrews, the works secretary.

Richmond (Surrey).—The Council have granted permission to the National Telephone Co. to place their wires underground. This permission gives the company the last link of a complete underground route from Twickenham to London, via Barnes and Mortlake. Consent has been given on the following terms:—

The company to pay the Corporation an annual sum of £50 in respect of the main route, and to pay for all other underground distributing routes in the district at £15 per mile. The company also to pay an annual rent of 10s. for each large and 5s. for each small junction-box placed by them. The arrangement to be determinable on 12 months' notice.

Sheffield.—The Electric Light committee have appointed Mr. S. E. Fedden chief engineer and manager of the electric supply department. The wiring and fittings and trading departments and factory are to remain under the commercial manager, who is to be head of the clerical staff under the direction of the chief engineer and manager.

Shoreditch (London).—An interesting report from the Finance committee was presented to the Vestry last week. The chairman (Mr. Kershaw) stated that in view of the heavy rate of interest now charged by the London County Council the committee had considered a suggestion submitted by the clerk (Dr. H. Mansfield Robinson) of raising the £50,000 required for electric lighting extensions by the issue of small bonds or mortgages to ratepayers and others, and they recommended the Vestry to approve of the proposal and refer it to them to consider the best means of issuing the loan. After discussion, and with the assent of Mr. Kershaw, the report was referred back by 27 votes 12.

Sleaford.—The Council have applied for sanction to borrow £7,000 for carrying out the electric lighting scheme proposed by Mr. E. Bremner Smith. The bill confirming the Council's provisional has received Royal Assent.

Smethwick.—The Midland Electric Corporation for Power Distribution have offered to give a supply of electricity in bulk in the district, and to pay the Council 10 per cent. of the gross receipts, provided the company obtain a supply concession for 15 years. The Corporation will have the power to take over the undertaking at the end of that period at cost price less depreciation. No decision has yet been given, as the Council propose to purchase the local tramways, and have not settled whether to lease the lines or themselves work the undertaking.

Smyrna (Turkey).—Latest reports from this district confirm a statement that anything connected with electrical working is taboo in the Turkish Empire. The import of any article is prohibited even to the dry cells used for electric bells. In one case elaborate electro-medical appliances for one of the chief hospitals were rendered useless, as after the passing by the Customs authorities no cells or coils were allowed to enter. In another case, a contractor wished to erect a lightning conductor over a large factory. As, however, the wires were similar to those in use for telegraphic work, they were not allowed to be erected and had to be reshipped.

Southport.—The accounts of the electricity department were presented and approved by the Corporation on Tuesday. The net profit amounted to £1,779, against £2.027 last year. The decrease is ascribed to the increase in the price of coal. £1,500 of the surplus has been applied in aid of the rates, and £279 carried forward. There were 607,002 units sold to private consumers, against 501,005 last year. Large extensions of the plant were carried out during the year, and extensions of the buildings are now being made. In the report of the borough electrical engineer (Mr. Charles D. Taite) it is well pointed out that although the profit for the year has fallen short of what was anticipated, and while the price of coal will necessarily cause a heavy increase in expenditure during the current year, these are only temporary checks. Current will be required for the Corporation electric tramways, and an appreciable reduction in the cost of generation will consequently ensue.

Stafford.—The total receipts of the electricity department for the year ended March 31 were £1,772. 15s. 7., and the expenditure £983. 0s. 8d., leaving £789. 14s. 11d. to meet interest (£560. 9s. 2d) and sinking fund instalment (£604. 6s. 2d.), so that there was a deficit of £375. 0s. 5d. on the year's working, compared with £81. 13s. 3d. The total revenue per kilowatt capacity of plant was £8s. 19s. 1d., and the working expenses £1. 19s. 4d. The revenue per 8 c.p. lamp connected was 4s. 2d. The charge for current for lighting is 7d. per unit for the first hour's maximum demand and 3d. after, or, alternatively, a uniform rate of 5d. per unit. Supply for power purposes is given at 3d. per unit. There are only four public arc lamps. There were 118,341 units generated during the year, 83,311 units sold to private consumers, 3,469 units for public lighting and 6,477 units were used on the works.

Stimulating Demand for Electricity Supply.—Mr. Henry Lyon, of Glasgow, writes:—

In the Papers read before the Municipal Electrical Association, at Huddersfield, there is much truth, but I am surprised that Ald. Potter and Mr. H. Collings Bishop should have omitted in their Papers to point out certain lines on which a day load can be created in summer time to balance the heavy winter load.

There are several ways of increasing the demand for electricity which would benefit electricity supply and the general consumer. Mr. Bishop urges that the following are amongst the means which promise well: (1) Low price; (2) Sliding scale giving long hour consumers a lower rate; (3) Free use of meters; (4) Free connections; (5) A "free" wiring system; (6) A system of wiring on the instalment plan; (7) Special low rates for current used for motive power, heating, and manufacturing purposes; (8) The hiring out of motors, arc lamps, heating and cooking apparatus (including inspection and repairs); (9) To enable short-hour consumers with a large number of lamps connected to obtain current at a lower rate than the maximum, and to reduce at the same time the load demanded from the station.

All the above, if carried out with careful thought and explained to the public clearly, would be effective, but I regret to say that up to the present few central station engineers have thought out what this means. They seldom point out how the motor can be applied by small tradesmen, or give him an idea of what the cost will be for his individual requirements. There are many applications of electricity that have never been brought before the public, and if corporations and the supply companies do not deal with these matters how are the tradespeople to learn the advantages of electric working?

I wish particularly to point out that in No. (7) Mr. Bishop omits the supply of electricity for refrigeration and cooling purposes. Now why omit cooling apparatus for the summer load, and refrigerating machinery for food stuffs, for the making of ice cream, cooled drinks, &c., &c? These all mean something in their separate uses to the small tradespeople, including the butcher, fishmonger, poulterer, hotel keeper, publican, restaurateur, dairyman, confectioner, fruiterer, &c. These tradesmen pay heavy rents, have to make use of every atom of space, and to guard against nuisance from vibration, black smoke, smell, &c.

Refrigerating by electricity means a six months' run of practically 24 hours, equal to 12 hours continually throughout the year. Now if the price per unit can be reduced to a sufficiently low rate (say 1d. per unit for refrigerating) the way is clear. Perfectly satisfactory refrigerating machines are now on the market, of various sizes, making from 1 cwt. of ice upwards, and these can be used also to cool a chamber to any degree suitable for any of the trades mentioned. These electric refrigerators have no motor, but use the current direct.

After two years' continual experimenting with both electric and gas refrigerators for small retail tradesmen, I find that with gas at 3s. per 1,000 c.f. feet, and electricity at 1d. per 1,000 watt hours, the cost of running either machine is just about equal. For example, a No. 3 machine making 3 cwt. of ice in 24 hours will consume 90 cu. ft. of gas per hour = 2,160 cu. ft. in 24 hours (at 3s. per 1,000 = say, 6s. 6d.). A No. 3 electric machine doing equal work in 24 hours would require about 78 units and not exceeding 80 units; this, at a summer day and night load of 1d., would cost at most 6s. 8d. for a 24-hour run. A machine that will make 3 cwt. of ice in 24 hours will give a cooling effect of 6 cwt. of melting ice, therefore to cool a room, using ice at the rate of 6 cwt. in 24-hours (ice at 2s. per cwt.), would cost 12s. per 24 hours, showing a saving of 6s. per 24 hours. But the great advantage of a refrigerator is, of course, that a room can be kept at any degree within the compass of the apparatus, which cannot be effected by the use of ice.

Swindon.—An enquiry has been held into the application of the Swindon New Town Council for power to borrow, among other sums, £3,100 for purchase of a site for an electricity generating station.

Venice (Italy).—The harbour authorities have placed an order for six electric cranes, ranging from 1½ tons to 3 tons, with the Schuckert Co. of Nuremburg.

Walsall.—On the application of Messrs. John Russell & Co. (Ltd.) it has been decided to extend the electric lighting mains and to provide two transformers at an estimated cost of £5,178, subject to the firm becoming responsible for an annual payment for electric current of £300 for 10 years. The Local Government Board proposed to defer sanctioning the borrowing of £15,000 until the sites of the transformer stations had been chosen, but the town clerk

Digitized by Google

has been instructed to point out that such a course would seriously delay the proposed extensions.

Water-Power Utilisation.—The British Consul at Bilbao states that in the province of Guipuzcoa a large development of the "hydro-electric industry" is a feature of the time. There are in all 34 factories actually working with water power; 57 additional concessions have been applied for, representing about 11,525 H.P.

Whitechapel (London).—The scheme for the extension of the electricity undertaking drawn up by the consulting engineer (Mr. Arthur Wright) in April last has been adopted and arrangements are being made to carry out the work at an estimated cost of £44,670. £20,500, balance of £60,500 originally applied for, is to be borrowed from the London County Council.

Whitefield (Manchester).—An agreement has been entered into with the Manchester Corporation for the transfer of the Whitefield provisional electric lighting order.

Willesden.—The scheme for a combined lighting and tramway electricity works, drawn up by the electrical engineer, Mr. E. T. Ruthven Murray, in view of the large size of the works and the capital involved, was submitted to Mr. E. Manville for an opinion. He has now reported, endorsing Mr. Ruthven Murray's proposals. On Monday the scheme, with certain alterations embodied in a supplementary report by Mr. Ruthven-Murray, was unanimously recommended by the Electricity committee for acceptance, and will come up for consideration at the next meeting of the Council. The system proposed is a high-pressure three-phase one with motor generators in sub-stations, where the current will be converted to continuous. An interesting feature is the employment of double-current generators at the power house, which can be used either to generate continuous current for the distributing circuits near the station, or three-phase current to be transformed to high pressure, or to supply current for both purposes at the same time. The estimate approved by the committee for the electricity works is as follows :—

Land, railway sidings and buildings	£55,080
Works and sub-station equipment	42,667
Mains and street work	34,517
Public lighting	2,838
Meters and house connections (1st year)	3,000
Total	£138,102
Add for bills of quantity, surveyor's charges, and contingencies	5,522
	£143,624

It is proposed that application be made for sanction to borrow this sum, and that repayment of any portion of the capital outlay may be postponed until the supply of electrical energy is available. The committee also recommend that Parliamentary powers be obtained for the construction of tramways over two routes, whose aggregate length is about 4 miles of single track. The estimated cost of these lines is £53,247. Assuming the two schemes to be carried out in combination, and taking account of the profits from the tramways, the committee estimates a deficiency of £2,658 at the end of the first year's working and £304 at the end of the second year's working, irrespective of sinking fund on the loan between the actual borrowing and the commencement of supply and exclusive of the additional cost of street lighting.

Whitby.—Messrs. Preece & Cardew have been appointed consulting electrical engineers in connection with the proposed municipal electricity scheme.

Worksop.—An inquiry will be held on Tuesday into the application of the Council to borrow money for electric lighting.

NEW BOOKS AND EDITIONS.

"THE ELECTRICIAN" READING CASE.—To hold four numbers of the journal. Strongly bound, 1s. net; post free, 1s. 4d.

"LOCALISATION OF FAULTS IN ELECTRIC LIGHT MAINS."—By F. C. Raphael. Price 5s., post free. The book deals with the important subject of localising faults in electric light and power cables; and the various methods of insulation testing are here collected and discussed.

"WIRELESS TELEGRAPHY: SIGNALLING ACROSS SPACE WITHOUT WIRES BY ELECTRIC WAVES." A Review of the Work of Hertz and his Successors.—By Dr. O. J. Lodge, with a large number of illustrations, bringing this latest application of electrical science quite up to date. New and Enlarged Edition, 5s. nett. *Now ready.*

"THE CENTENARY OF THE ELECTRIC CURRENT, 1799-1899."—By Dr. J. A. Fleming. Price, paper covers, 1s. net, post free 1s. 3d.; strong cloth, s. 6d., post free.

"MOTIVE POWER AND GEARING FOR ELECTRICAL MACHINERY."—By E. Tremlett Carter, C.E., M.I.E.E. Price 12s. 6d., post free. In this comprehensive work an account is given of the scientific principles and modern practice in the use of engines for dynamo driving, not only for isolated power plants, but also for public electric lighting and power stations. The various forms of gearing in the power station and for electric motors are also dealt with; and the book contains, in addition, numerous tables giving exact data of the equipment and working of electric power stations.

"MAGNETIC INDUCTION IN IRON AND OTHER METALS."—By Prof. J. A. Ewing. Price 10s. 6d. net. *New Edition (Third) now ready.*

"ELECTRIC LAMPS AND ELECTRIC LIGHTING," by Prof. J. A. Fleming, M.A., D.Sc., F.R.S., is handsomely bound, and full of original illustrations, designs, initials, &c. *New and Cheaper Edition*, 6s., post free.

"THE STUDENTS' GUIDE TO SUBMARINE CABLE TESTING."—A new edition of this book, by Messrs. H. K. C. Fisher and J. C. H. Darby, is now ready, price 6s. net; abroad, 6s. 3d. This work is intended to serve as a guide to operators already in the telegraph service, and to those who desire to enter that service. The great cable companies now insist that their operators and probationers shall pass certain examinations in electrical subjects. The book is very fully illustrated.

"ELECTRO-CHEMISTRY."—By Dr. G. Gore. Third Edition. Price 2s., post free.

TRADE NOTES AND NOTICES.

[*Notices for insertion under the above heading must reach the Office not later than first post Thursday morning. New Catalogues, Price Lists, and similar matter should be sent early in the week.*]

TENDERS INVITED.

The Electric Lighting committee of the Vestry of *St. Mary, Islington* (London) require tenders for relaying York and other stone, and providing new York and other stone where necessary, over the electric conduits and mains which may be required during the ensuing three years. Further particulars are set out in an advertisement, and specifications may be obtained at the electricity department, 50, Eden-grove, Holloway, N. Tenders to the vestry clerk (Mr. Wm. F. Dewey), Vestry Hall, Upper-street, N., by noon of 25th inst.

Darlington Corporation require tenders for arc lamp posts and brackets. Specification may be obtained from the town clerk (Mr. Henry Steavenson), and specification can also be seen at (but not obtained from) the offices of Prof. Alex. B. W. Kennedy, 17, Victoria-street, Westminster, London, S.W. Further particulars are set out in an advertisement, and tenders must be delivered at Mr. Steavenson's offices before 28th inst.

Sunderland Corporation invite tenders for coal-conveying plant for their electricity station. Specification may be obtained from the borough electrical engineer (Mr. J. F. C. Snell), and tenders (addressed chairman of Lighting committee) must be delivered at the office of the town clerk (Mr. Fras. M. Bowey), Town Hall, Sunderland, by noon of 27th inst. An advertisement contains further particulars.

Aston Manor District Council require tenders for the supply and erection of electricity generating plant, particulars of which are set out in an advertisement. Specification, &c., may be obtained at the offices of the consulting engineer (Mr. Reginald P. Wilson), 66, Victoria-street, Westminster, and tenders (addressed to Chairman of Health committee) must be delivered at the Council offices, Aston Manor, not later than noon of 24th inst. Mr. Joseph Ansell is clerk to the Council.

Halifax Corporation invite tenders for combined steam engine and alternator, alternators, static transformers, induction motors, rotary converters, and three-phase extra high-tension switchboards. Specification may be obtained from the borough electrical engineer (Mr. H. F. Street), Foundry-street, Halifax, and tenders must reach the town clerk (Mr. Keighley Walton) by noon of Tuesday, 31st inst. An advertisement contains further particulars.

Hull Corporation invite tenders for an electric lighting installation at the Springhead pumping station. Forms of tender may be obtained from the water and gas engineer (Mr. F. J. Bancroft), Broadley-street, Hull, and tenders should be delivered to the chairman of the Water and Gas committee, Town Hall, Hull, before 10 a.m. of 23rd inst. An advertisement contains further particulars.

Hull Corporation require tenders for five high-tension continuous-current rotary transformers, with switch gear and accessories. Further particulars are set out in an advertisement, and specifications may be obtained at the city treasurer's office. Tenders to chairman of Electric Lighting committee, Town Hall, Hull, by noon of July 26.

Salford Electric Light committee invite tenders for nine transformers and 4½ miles of low-tension concentric cable. Specification may be obtained from the borough engineer (pro tem), Mr. F. A. Wilkinson, Walness-road, Broughton, and tenders (addressed to chairman of committee) must be delivered to the office of the town clerk (Mr. L. C. Evans) before 10 a.m. 27th inst. Further particulars are set out in an advertisement.

Salford Corporation invite tenders for laying cables, tramway feeders, and street lighting. Specifications may be seen or obtained at the offices of the consulting engineers (Messrs. Lacey, Clirehugh & Sillar), 2, Queen Anne's-gate, Westminster, and 78, King-street, Manchester, but can only be seen at the latter offices. An advertisement contains further particulars, and tenders must be delivered to the town clerk (Mr. L. C. Evans) by Aug. 13.

Salford Corporation also require tenders for overhead equipment for tramways, exclusive of steel poles. Tenders to town clerk by July 16,

Digitized by Google

Manchester Tramways committee invite tenders for the electrical equipment of 150 cars. Specifications may be obtained from general manager, Tramways department (Mr. J. M. M'Elroy), Town Hall, Manchester, and tenders to chairman of committee, by Saturday, 21st inst. An advertisement contains further particulars.

Sheffield Corporation invite tenders for twelve months' supply of transformers for their electricity department. An advertisement contains additional particulars, and specifications can be obtained from the chief engineer and manager (Mr. S E. Fedden), to whom tenders should be delivered before 21st inst.

Rugby District Council invite tenders for taking a lease of their provisional electric lighting order (1898). Applications to Mr. T. M. Wratislaw, clerk and solicitor, Council offices, Rugby, by Aug. 1. See advertisement.

Tenders are required for electricity generating plant at the *Mullingar* (Ireland) Lunatic Asylum. Forms of tender from Mr. J. W. Edmundson, 35, Capel-street, Dublin, and tenders to the Board by 23rd inst.

Blackpool Corporation invite tenders for trolley poles, cables, and trolley wire, boosters, switchboards and storage battery. Tenders to chairman Electric Lighting and Tramways committee by July 23.

Wimbledon District Council require tenders for supplying and fixing telephones at the isolation hospital. Tenders to clerk by 18th inst.

Southend Council invite tenders for electric traction plant, about 1,180 tons of steel rails, 46 tons of steel fish-plates, &c. Tenders to town clerk by July 25.

Beckenham District Council invite tenders for "free" wiring. Tenders to clerk (Mr. F. Stevens) by 4 p.m. of July 16.

Grays Thurrock District Council require tenders for electricity generating plant. Tenders to clerk by noon of Aug. 9.

Trimdon (Co. Durham) Parish Council invite tenders for public lighting by electricity or acetylene gas. Tenders by July 17.

London County Council require a 2-ton overhead traveller. Tenders to clerk by 19th inst.

Tenders are invited for the electric lighting of *Hapton* from Sept. 1 to April 30 next. Tenders to clerk, 16, Hammond-terrace, Padiham, by 31st inst.

Bradford Corporation invite tenders for steel girder and steel trough rails and fishplates. Tenders to town clerk by 28th inst.

Stockport Tramways committee invite tenders for 20 double-deck tramcars with electrical equipment for overhead traction. Tenders to town clerk by Aug. 31.

Tenders are invited by the *Liverpool* Select Vestry for an electric light installation of about 100 lights at the Parish offices, Brownlow Hill. Tenders to clerk by 19th inst.

The Director of Contracts, *Valetta* (Malta), invites tenders for dynamo and engine oil by July 28.

Tenders are invited for the electric lighting of *San Martin de Valdeiglesias* (Spain) for 20 years at the upset price of 3,500 pesetas (about £110) for the supply of lights equivalent to 2,400 candles. Tenders were invited in February last, but no offers were received. Some alterations have now been made in the terms.

Application has been made, accompanied by particulars of project and pledge of security, for the concession of an electric tramway in *Barcelona* (Spain), from the Plaza de Cataluña to the suburb of Vallcarca, with one branch. Further applications will be received up to 28th inst.

The *Russian* Government are inviting tenders until 28th prox. for the public telephone service of Warsaw, St. Petersburg, Moscow, Odessa, and Riga.

TENDERS RECEIVED AND ACCEPTED.

The following tenders have been received by the Brighton Corporation for the supply of incandescent electric lamps for one year from July 1. The prices given are per lamp of either 8 c.p. or 16 c.p. in their respective voltages :—

	115 volt.		230 volt.	
	s.	d.	s.	d.
Zurich Incandescence Lamp Co. (*accepted*)...	1	3¾	1	3¾
(less 2½ per cent. discount.)				
Berrenberg Electric Lamp Syndicate	1	0½	1	5
Edison & Swan Co.	1	0	1	0
Sunbeam Lamp Co.	0	9½	1	1
General Electric Co.	0	8½	1	0
Crystal Electric Lamp and Rose & Bird	0	8	1	0
Krupka & Jacoby	0	7	0	10
Brush Co.	0	7	0	9½
A. Hunt & Co.	0	6	0	9
English Industrials	0	7	0	9½
Polland & Co.	0	6	0	9

Derby Sanitary Authority has accepted the tender of Messrs. Newton Bros. for an electric lighting installation at the Infectious Diseases Hospital, at £165. 7s. 4d. Four tenders, ranging in amount from that of the accepted to £236, were received.

London County Council have received the following tenders for the supply of plant, &c., for the electric lighting of Farmfield Reformatory :—

Oil Engine.—Bilbie, Hobson & Co. (Hornsby-Akroyd engine), £257; Priestman Bros., £312. 5s.; Crossley Bros., £324.

Wiring.—Tamplin & Makovski, £309. 14s. 6d. (for wood casing, and £360 steel tubing; Strode & Co., £349 and £373; Concentric & General Contract Co., £360 and £440; F. A. Glover & Co., £407 and £450; A. H. Wood, £484 and £530; E. P. Dickson, £678 and £700.

Dynamo.—Thomas Parker (Ltd.), 700 revs. unfixed, £165, 900 revs., £143; Electric Construction Co., 620 revs., fixed, £139; India Rubber Co., 600 revs., unfixed, £130, fixed, £136; Siemens Bros. & Co., 720 revs., £182.

Battery.—Chloride Co., 25 amp., £159; 70 amp. short, £183; 60 amp. long, £327. Electrical Power Storage Co., £144, £158 and £278 respectively.

In all cases the lowest tender was accepted.

The Council also accepted a quotation of £174 per mile from the British Insulated Wire Co. for certain cable, of which a small quantity was likely to be required.

The tender of Messrs. R. Dawson & Son (Ltd.) has been accepted for wiring the new cottage homes at Penkhull, for the Stoke-on-Trent Guardians, at £470.

The following tenders have been received by the Bradford School Board for an electric lighting installation at the Carlton School :—

G. A. Steinthal (*accepted*)	£265	Collinson Bros.	£315
Rhodes & Webster	365	G. F. Cook & Co.	196
Alfred Sykes	316		

Cheltenham Town Council have accepted the tender of Messrs. Collins & Godfrey for extensions to the electricity buildings at £1,875.

The tender of the British Insulated Wire Co. has been accepted by the Newington (London) Vestry, for supplying and laying mains in the side streets in the district, at £9,026. 5s. 6d. A full list of tenders appeared in our issue of June 22, p. 346.

Lambeth (London) Vestry have considered the undernoted tenders for additional electric lighting work at the Kennington-road baths :—

Walter Mossop & Co. ..... (*accepted*)	£48	15	6
Geipel & Lange	90	10	0
Woods & Co.	67	0	0

The tender of Messrs. Rosser & Russell (£81. 5s.) has been accepted by the Middlesex County Council for the supply of radiators and an electric fan for the record room at the Westminster Guildhall.

Southport Corporation have accepted the tender of Messrs. S. Z. de Ferranti (Ltd.), for the supply of five 30kw. transformers at £82. 15s. each.

Plymouth Corporation have accepted the tender of Messrs. Wakeham Bros. for the erection of a sub-station in Armada-street, for £1,858.

Newport (Mon.) Corporation have accepted the tender of Messrs. A. Krauss & Son for constructing the Corporation-road tramway route at £13,362. The tender is exclusive of rails. Messrs. A. S. Morgan & Co. also tendered at £14,162. The borough engineer's estimate was £13,993.

Hastings Corporation have accepted the tender of Messrs. Babcock & Wilcox for the supply of a new 250 H.P. boiler, with superheater, for £150, the firm taking back two 40 H.P. boilers at the Waterworks-road station and two boilers (140 H.P. and 160 H.P. respectively) at the Earl-street station.

APPOINTMENTS VACANT AND FILLED.

Bolton Corporation invite applications for the post of electrical engineer to take charge of their electric lighting and tramway undertakings. Further particulars are set out in an advertisement, and applications must be delivered to the town clerk (Mr. R. G. Hinnell) not later than 30th inst. The Corporation are offering a salary of £500 per annum, with annual increments of £50 to a maximum of £700. As stated in our last issue the Electric Lighting committee unsuccessfully endeavoured at the last moment to retain Mr. Ellis's services by offering him an immediate increase of £150 per annum.

Fulham (London) Vestry invite applications for the following appointments in connection with their electric lighting and refuse destructor works :—Destructor superintendent, chief clerk and three shift engineers. Further particulars are set out in an advertisement, and applications must reach the clerk (Mr. W. J. H. Denselow), Town Hall, Walham-green, London, S.W., before 25th inst.

Ilford Urban District Council are prepared to receive applications for the post of clerk of works for their electric light station and cable laying. Salary £3. 3s. per week. Applications must be sent in by Monday, 10th inst to Mr. John W. Benton, clerk to the Council offices, Ilford. See advertisement.

The Governors of the Birkbeck Institution invite applications for the position of head of the physics department. Further particulars are given in an advertisement, and applications must be sent to the principal, Bream's-buildings, Chancery-lane, E.C.

A chief lecturer in electrical engineering is required for the Salford Royal Technical Institute. An advertisement contains additional

Digitized by Google

particulars, and forms of application may be obtained from the secretary (Mr. Richard Martin) up to 24th inst.

A junior demonstrator in physics is required for the South Western Polytechnic, Manresa-road, Chelsea, S.W. An advertisement contains further particulars, and forms of application may be obtained from the secretary.

An assistant is required in the engineering department of the Merchant Venturers' Technical College, Bristol. Applications to registrar by Aug. 13. See advertisement.

The governors of the Technical Institute, Wandsworth, London, S.W., require a qualified teacher to take classes in electric testing and wiring. Applications by July 19.

A demonstrator and assistant lecturer in physics is required for the University College of South Wales and Monmouthshire, Cardiff. Applications to secretary, by Sept. 9.

Darlington Corporation require a borough electrical engineer. Applications to town clerk by July 21.

Mr. D. Robertson, of Glasgow, has been appointed lecturer in electrical engineering at the Bradford Municipal Technical College.

Mr. G. L. Andrews, B.Sc., assistant engineer to the Hull Corporation tramways, has been appointed chief engineering assistant to the Sunderland Corporation tramways.

Mr. Hubert Pooley, of the Dunfermline gas works, has been appointed manager of the gas and electricity works at Stafford in succession to Mr. J. F. Bell, resigned.

Mr. A. E. Cramb, of Huddersfield, has been appointed assistant electrical engineer at the Hampstead Vestry's electricity works.

BUSINESS NOTICES.

Messrs. W. Probert & Son, brass founders and electric fittings makers to the trade, have removed from Tower-road, Aston, to more extensive premises at the Crescent, Sorith-road, Hockley Brook, Birmingham.

Mr. George Hatch, of. 5, Upper Thames-street, London, E.C., informs us that for family reasons his business has been registered as a private limited company under the title of George Hatch (Ltd.). The management continues as heretofore.

BANKRUPTCIES, LIQUIDATIONS, &c.

A report just issued by the committee of inspection appointed on June 14 by the principal creditors of Messrs. Laing, Wharton & Down (Ltd.) (in liquidation) states that an inspection of the stock, plant, and machinery, with a view to realising same to the best advantage, has led the committee to the unanimous opinion that the assets should be sold by public auction, "as the present condition of the trade is such that better prices than usual will probably be realised, firms being glad to avail themselves of the opportunities offered by auctions to obtain certain of their requirements without delay." It is pointed out that the whole of the assets of the company are in the possession of the receiver for the debenture holders, who is entitled to sell the same subject to the approval of the High Court. The receiver has, however, accepted suggestions from the committee, who have recommended that the stock, plant, and machinery should be sold by auction.

Claims against the Midland Electrical & General Engineering Co. (Ltd.) must be sent by Aug. 13 to Mr. W. B. Winnicott, 20, Fletcher-gate, Nottingham.

The Electric Automobile Syndicate (Ltd.) is to be wound up voluntarily. Mr. A. Brown, 28, Great Eastern-street, London, E.C., is liquidator.

In the bankruptcy of J. E. Stott (trading as James E. Stott & Co.), electrician, 10, Wood-street, Byram-arcade, and 9, Westfield-road, Huddersfield, the trustee, Mr. T. H. Kaye, has been released.

In the failure of C. H. Kitching, electrical engineer, &c., 20, St. Hilda-street, 172, Beverley-road, and 42, Chariot-street, Hull, the trustee, Mr. J. H. Fox, has been released.

The following are the principal creditors in the sequestration of the estate of Wm. Ramsay & Co., electrical and gas engineers, 195½, Argyle-street, and 11, Jamaica-street, Glasgow :—

Edison & Swan Co.	£206	Guest & Chrimes	£25
Brownlie & Co.	151	W. T. Henley's Telegraph Works Co.	23
Falk, Stadelman & Co.	147	International Electric Co.	23
J. Barwell	34	C. Schultze & Sohn	18
Edwards Bros.	28	Sun Electric Co.	17
Wright-Butler Lamp Manufacturing Co.	28	Wm. McGeoch & Co.	16
Dobbie, Forbes & Co.	26	I. Frankenburg	15

Sales by Tender.—Leeds Corporation are open to receive tenders for two horizontal Fowler engines of 400 I.H.P., two sets of Greenwood and Batley dynamos, one spare armature to fit any dynamo, and a switchboard and instruments. The plant at present in use in connection with the Corporation's system of electric tramways. Will be available for removal about February next. Further information can be obtained from Messrs. Hopkinsons and Talbot, 26, Victoria-street, London, S.W.

The premises and plant of a long-established engineering business in Edinburgh are advertised for sale in an advertisement in another column, or partnership might be arranged. Applications to 550, Messrs. Keith & Co., advertising agents, Edinburgh.

Fire—A small fire occurred at the Prescot works of the British Insulated Wire Co. late on Monday night. A drum of cable in a drying-oven caught fire but the fire was promptly extinguished by the company's own brigade. Little damage was done to the premises but a good many drums of cable in course of manufacture were spoilt by smoke and water. This will involve a few days' delay in the delivery of this particular order, otherwise no inconvenience or delay will arise.

Mather & Platt Plant.—A third edition of a useful pocket catalogue relating to the electrical engineering machinery manufactured by Messrs. Mather & Platt (Ltd.) of Manchester, is just published. The book has been carefully revised and some additions made.

Condensers for Steam Engines—A very complete catalogue of condensers for steam engines, comprising the ejector and evaporative types made and supplied by Messrs. T. Ledward & Co., 25, Queen Victoria-street, London, E.C., is just issued, and, besides giving illustrations of the apparatus, is accompanied by notes and instructions for fixing and working, which steam users will find of service. Among the list of firms to whom these ejector condensers have been supplied are many leading electrical engineers and contractors and municipal electricity supply stations of the kingdom. Some useful tables are also given.

E.P.S. Small Storage Batteries.—Mr. J. W. Barnard notifies us that the increased demand for E.P.S. small storage batteries has necessitated his taking additional premises at No. 6, Great Winchester-street, London, E.C., where he will have increased facilities for keeping an adequate stock ready at all times for immediate delivery.

Exports of Electrical Apparatus and Material.—The following list gives official particulars of the exports of British manufactured electrical apparatus and material (including telegraph and telephone wire and material, but not including electrical instruments or machines, which are not separately specified) from July 4 to July 10, with the ports of destination :—

Africa—Alexandria, £51; Cape Town, £297; Durban, £375; East London, £207; Port Elizabeth, £329. *Argentina*—Buenos Ayres, £93. *Australasia*—Christchurch, £44; Melbourne, £770 (including £408 telegraph cable); Sydney, £464. *Belgium*—Ostend, £11. *British Guiana*—Demerara, £150 (telegraph material). *Ceylon*—Colombo, £35 (telegraph material). *Chili*—Valparaiso, £50. *China*—Shanghai, £167 (including £126 telegraph material). *Denmark*—Copenhagen, £478 (telegraph wire). *Germany*—Hamburg, £320 (telegraph material). *Holland*—Amsterdam, £51. *Hong Kong*, £5. *India*—Bombay, £68; Calcutta, £706; Madras, £14. *Japan*—Hiogo, £1,466; Yokohama, £449. *Malta*, £66. *Russia*—Libau, £10; St. Petersburg, £250. *Siam*—Bangkok, £180. *Sweden*—Gothenburg, £25; Stockholm, £225 (telegraph material). Total £7,356, against £18,854 in the corresponding week last year (July 5 to July 11).

PATENT RECORD.

The following list of Applications for Patents and Specifications published has been compiled for this journal by Messrs. J. C. Chapman and Co, *Chartered Patent Agents, of 70, Chancery-lane, W.C., from whom any available information in connection with Patents, Designs, and Trade Marks may be obtained.*

APPLICATIONS FOR PATENTS.

Note.—*The undermentioned Applications are not open to public inspection until after the acceptance of the complete Specification. The names within parentheses are those of communicators of inventions. When complete specification accompanies application, an asterisk is affixed.*

April 25, 1900.

7,737. A. Tribelhorn. London. Improvements in and relating to arc lamps.

7,753. R. Thompson and J. Dunphy. London. Coupling for electric or other wires.

7,759. L. Pauer and J. de Kutschera. London. Improvements in electrically-operated submarine working devices.*

7,768. E. W. Junguer. London. An improved negative accumulator electrode.*

7,777. G. Marconi and Marconi's Wireless Telegraph Co. (Ltd.). London. Improvements in apparatus for wireless telegraphy.

7,781. C. G. Robinson. London. Improvements in apparatus for wireless telegraphy.*

7,782. C. G. Robinson. London. Transmitting and receiving switch for wireless telegraphy.*

April 27, 1900.

7,784. G. Davis. London. Improved system of distribution and collection of current for electric traction.

10,536. Accles. Electrical contact devices for explosion engines fired by electricity.
11,244. Blumenberg. Compounds for battery solutions.
11,446. Heyl-Dia. Electric cables.
11,693. Callender's Cable & Construction Co. (Ltd.) and Callender. Apparatus for connecting branch circuits to electric mains.
11,843. British Thomson-Houston Co. (Ltd.) (Union Elektricitäts-Gesellschaft and Zani). Devices for starting electric induction motors.
11,901. Poole. Electrical brush-holders.
11,983. Smith. Attachments for collectors in electric tramways with slotted conduits.
11,984. Smith. Poles for supporting overhead wires in electric tramways.
12,235. Rankin (Ludington). Machine for filling cases or packets with cigarettes or the like.
12,274. Oppenheimer (Actien-Gesellschaft, Mix & Genest). Magneto-generators.
12,420. Braun. Wireless telegraphy.
12,667. Johnson (firm of Hartmann & Braun). Earthed coverings or electrical tubular conductors.
12,788. Hertel. Method and means for increasing the conductivity of carbon to be used in electric cells and dynamo-electric generators and motors.
12,874. Applegarth. Glass globes, screens, covers or the like for electrical incandescence and other lamps, and in means for manufacturing the same.
13,074. Schoop. Apparatus for electrolysis.
13,105. Jandus Arc Lamp & Electric Co. (Ltd.) and Jones. Electric arc lamps.
13,226. Rose and Hall. Construction or arrangement of appliances for underground or conduit traction by electricity.
13,230. Söderlund and Ekvall. Apparatus for supporting pendent globes applicable to the globes of enclosed arc lamps.
13,233. Gehre. Apparatus for periodically producing electric current by wind power.
13,256. Smith. Means of lessening the danger attendant upon the employment of overhead conductors in electric tramways.
13,270. Sinclair and Aitken. Telephone exchange systems.

COMPANIES' MEETINGS AND REPORTS.

Electric Construction Co. (Ltd.).

The seventh annual general meeting of this Company took place yesterday under the presidency of Mr. James W. Barclay (deputy chairman of the Company) in the unavoidable absence of Sir Daniel Cooper, Bart., G.C.M.G.

The SECRETARY (Mr. James Gray) having read the notice convening the meeting,

The CHAIRMAN said: Gentlemen, the accounts and report require few remarks of mine to recommend them for your adoption. The results on the whole are very similar to those of last year. The general outcome is that we have to deal with a profit of £21,729. 1s. 9d., and this we propose to do by paying the fixed preferential dividend and distributing 6 per cent. to the ordinary shareholders, carrying the balance of £4,777. 1s. 9d. to the credit of next year's profit and loss account. The cost of maintaining the works, renewing and upholding the plant, adequate provision for bad debts, and other liabilities, and adding £5,000 to the general depreciation account, come all out of profits as usual. You will observe that for the past seven years we have applied £33,000 of our profits in reducing the capital account, while the works, I am sure, have now more capacity for earning dividends than ever before. The figures in the profit and loss account are very much the same as last year. The expenditure has always a tendency to grow, and it is our business to limit the increase to what is necessary for maintaining due efficiency. The balance-sheet shows the expenditure, so far, on the extensions. Of the additions to plant and furniture during the year, £5,798 has been for additional tools in the old works, and the balance of £9,785 is made up by payments to account of plant for the extensions. If explanations respecting any other accounts are required, I shall be happy to give them. At our last general meeting you were informed that we had contracted for additions to our workshops, including, of course, plant to equip them, which costs a good deal more than the buildings. The structure of the additional shops has been finished, and is now being filled with tools and appliances of the latest improved description for facilitating the outturn of work and for reducing the amount of hand labour in the process of construction. When the shops are finished I do not hesitate to say they will be in every respect the best in the United Kingdom for manufacturing large electrical machines. During the last seven years the size of the machines we are required to produce has very largely increased, but while it is unsafe to predict the developments which may take place in electrical machinery, practical considerations lead to the conclusion that the limit of size has nearly been ascertained, and we are of opinion that our works will be able to cope with the largest machines that will be demanded. As mentioned in the report, we have, during the past year, successfully completed the equipment of the City and South London Railway extensions with plant and appliances of exclusively British manufacture. This seems to be a sufficient answer to those who assert that British manufacturers cannot produce the best machinery for electric traction. The system adopted on the City and South London Railway to meet the condition of distributing power over a considerable length of line from one generating station has not been borrowed from the United States, and it was indeed, I believe, prophesied by some of our Transatlantic competitors that the system would prove a failure, but those prophets seem to have forgotten that the Electric Construction Corporation equipped the Liverpool Overhead Electric Railway before there were any overhead electric railways in America. We have never failed in any work we have undertaken yet. These facts should encourage British corporations to have more confidence in their own countrymen and not accept implicitly the assertions of interested rivals. You have no doubt also observed in our report with much satisfaction that the relations between the Board and employés of all classes are thoroughly harmonious. While anxious to do our best for our shareholders we do not forget the interests of those on whose cordial co-operation so much of our success depends. Confidence between employers and employed is a plant of slow growth, but we believe that seven years' experience has taught our employés that their Directors have their interests also at heart, and, in consequence, a feeling of *esprit de corps* has grown up, and each man feels an individual interest in, and is proud of, his connection with the Company. As to the future, we are full of orders, so much indeed that we are pressing forward the completion of our new shops to enable us to execute them without undue delay. The prices at which we are booking orders give promise of fair profit, although we may, of course, complain that competition does not allow us the profits we would like, and that we think we ought to have, but our new extensions will after a time give us an increased output larger than the proportion of increased standing charges they involve, and the saving thus effected will probably be divided between ourselves and customers. Gentlemen, I think you will recognise that your Directors are endeavouring to keep abreast of the times, and I have no doubt that the skill and capacity of our establishment will give us results at least as good as our neighbours. On the whole, then, I believe that our position in the manufacturing world is becoming more and more firmly established, and that we may regard the future with confidence. In illustration of what the Board are doing and the spirit in which they manage the works, I may tell you that we have sent to Paris at a moderate expense some 20 or 30 of our leading men in order that they may see in the exhibition there what is being done in the electric machinery world abroad. This will give them an opportunity of comparing what we turn out with what is produced on the Continent. Our insular position, perhaps, induces us to believe that in the Midlands they turn out a good deal better machinery than is made in any other part of the world. I am inclined to believe that the experience which these men will have in Paris will open their eyes to the keen

Digitized by Google

competition we have to meet from our competitors abroad not only in regard to manufacture, but also in regard to prices. Our manager, Mr. Blackburn, assures us that he thinks the company will get very good value for their expenditure in having sent these men to Paris. I now move the adoption of the report and accounts.

Sir HENRY C. MANCE, C.I.E., seconded the motion.

In answer to Colonel BUTTANSHAW,

The CHAIRMAN stated that the Madras Electric Tramways came into the Company's hands in the course of business. The company which employed this Company to carry out the contract was unable to complete it, and the property passed into the hands of trustees for the debenture holders. The Tramways Company had ample opportunity of retaking possession, but the directors of that company lost the confidence of their shareholders in Madras, and the undertaking, therefore, passed into the hands of this Company. The price of these tramways per mile was, perhaps, less than half the cost of any other electric tramway in the world. The Directors believed that the traffic, which was steadily developing, would yield a profitable return to the Company. At the same time they would not lose an opportunity of passing the concern over to some other parties, because it was not in this Company's line of business.

Dr. DRYSDALE inquired whether there were any orders for electric tramways in this country.

The CHAIRMAN replied that the Company made a large amount of generating plant for tramways, but they did not make the tramway cars, which formed a separate part of the business. The Company had their fair share of the construction of the heavy machinery.

The motion was carried unanimously.

Sir Daniel Cooper and Sir James Pender were re-elected directors, and the retiring auditors were re-appointed. A cordial vote of thanks to the Chairman and Directors terminated the proceedings.

City of London Electric Lighting Co. (Ltd.).

At an extraordinary general meeting of this company, held on Wednesday, a resolution authorising the directors to borrow any sums not exceeding in the whole £400,000 in excess of the amount of the debenture stock of the company outstanding and the premium payable thereon on redemption was approved.

The chair was taken by Sir DAVID L. SALOMONS, who reviewed the recent history of the company, and explained that the present issue was necessitated by the large amount of capital expenditure involved in the extension of the company's business. He said that it was absolutely essential that more capital should be found to pay off outstanding liabilities on capital account, and to provide for their increasing business, otherwise the company could not continue its operations. With regard to the position of the shares on the market, the chairman said that, notwithstanding the course of recent events, the company had a good property; but the directors recognised the present position of the market, and that it was not possible to issue their remaining 10,000 £10 shares at par. As they could not issue them at a discount, they had sought another form of raising the necessary money, and recommended the shareholders to increase the borrowing powers of the board in the manner suggested in the resolution. In reply to an amendment that the question of raising additional moneys should be postponed for a fortnight, the chairman said that by the end of the year a large sum of money would be required to meet liabilities accruing. They were under Parliamentary obligation to supply electric current, and if they were to fail, or if their contractors came forward and they could not pay them, the position of the company would be a serious one. The whole point was that their business had expanded. The unfair treatment they had received on the part of the Corporation of the City of London had no doubt seriously affected the value of their shares. That was not the fault of the directors. They had fought tooth and nail and were still fighting to get a just recognition of their rights. They were face to face with serious competition and it was their duty, and it was necessary, that they should get their new works pushed forward. He asked the shareholders to have confidence in the directors and leave it to them to raise the money in the best way possible. All the directors required was to be in a position to pay existing liabilities and to meet all actual requirements for continuing the supply of current next winter. They had asked for a sum which would keep them going for some time. Every year they had something like 60,000 extra lamps to provide for. In fact, since the issue of their last circular a few days ago, 3,000 further lamps had been applied for. This meant continuous capital expenditure, and he took it that the point to be insured was that the capital should be expended in a manner that would eventually bring them an adequate return as far as ordinary man could forsee.

Mr. G. HERRING said the money was not required to settle up past matters. It was required because the business was expanding, and there was, consequently, no necessity for any doleful talking. He would point out that their original idea was to provide for a total of 350,000 8 c.p. lights, whereas they had now connected 483,000, and applications for a further 3,251. They could not continue to make provision for this large number of connections without capital expenditure.

The amendment was negatived and the original resolution agreed to.

A SHAREHOLDER asked if any information could be given as to the position of the litigation now going on between the company and the City of London Corporation.

The CHAIRMAN said, strictly, such a question was not in order, but he would point to the fact that they had a judgment in their favour by Mr. Justice Farwell. The City authorities had, however, appealed and that was just how the matter stood. The appeal would not be heard until the autumn, he expected.

A vote of thanks to the chairman and directors terminated the proceedings

Electrical Power Storage Co. (Ltd.).

The eleventh ordinary general meeting of this Company was held yesterday (Thursday), Mr. J. IRVING COURTENAY presiding.

The SECRETARY (Mr. David Smith) having read the notice convening the meeting,

The CHAIRMAN said: You will see from the report, that after paying debenture interest and adding about £1,250 to our reserve and contingent funds—which now amount to the substantial sum of £13,000—a balance of £4,620. 16s. 1d. remains available for distribution. Out of this sum the Directors recommend a similar dividend to that which has been paid for the last seven years—namely, 5 per cent.—which will absorb £4,362. 8s. 5d., leaving £258. 7s. 8d. to be carried forward. The new buildings are now being utilised to their full extent, and indeed so much has the business increased that even these additions are found hardly sufficient. As stated in the report, the development of the business has necessitated the introduction of further working capital, and a call of £1 per share has been made during the year on 3,132 ordinary shares, on which only £3 per share had been previously paid. The works are in good condition, and the increase in their capacity has resulted in considerable economies in production. The average price which we paid for our staple article—lead—during the financial year under review was 22 per cent. in excess of that paid in the previous year. I may add that the persistent rise in the prices of raw materials has necessitated our adding a further 5 per cent to our list prices for manufactured goods. This increase came into force on the 1st of the present month. The rise in prices of raw materials is a condition which at the present time has to be faced by nearly every commercial manufacturing company and firm. There has been no falling off in the severe competition which exists in the storage battery industry. We think, therefore, that we have reason to be satisfied with the result of the year's trading, especially when it is remembered that, besides increasing our reserves, as already mentioned, we have thoroughly maintained the buildings, plant, and tools of the Company at a cost of £1,646. 6s. 5d., and have written off £748. 3s. 9d. for depreciation, both of which sums have been provided out of the year's revenue. I intimated at the last meeting the intention of the Directors to send an exhibit to the Paris Exhibition. This has been done, and though the exhibit is not a large one, we have endeavoured to make it as effective as possible. We hope thus to direct special attention to the Company's traction types of cells, and, as a consequence, to increase our market for these goods. The cost of this exhibit has also been debited to the revenue of the year. The special type of battery which we have introduced for power and tramway stations has proved a great success. The battery, which we installed now two years ago in Liverpool for the first experimental tramway line of the Corporation, has proved so satisfactory that during the present year we have obtained contracts for six additional batteries for use in various parts of the city in connection with the different tramway routes. These contracts were obtained by us at a figure in excess of that quoted by our competitors, owing to the satisfactory working of the first battery installed. A battery of a similar type has been installed for the Bradford Corporation during the present year, and we have also obtained an order from them for a duplicate battery, in addition to which, amongst many others, we have installed batteries for the Corporations of Birkenhead, Bury St. Edmunds, Doncaster, Gloucester, and Wigan, the Metropolitan Electric Supply Co., and the Royal Mint. The works were never busier than they are at present, and among the more important contracts which we have now in hand are two large batteries for the Liverpool Overhead Railway; also batteries for the Corporations or Urban District Councils of Barnes, Birkenhead, Doncaster, Horsham, Ilford, Motherwell, Rotherham, and Walsall. As you are no doubt aware, since the last meeting, the London Electrical Cab Co. has ceased operations, and has been put into the hands of a receiver for the debenture holders. This is unfortunate in the interests of electric traction, but I can state emphatically that the non-success of the cab company was in no way due to any failure of the Faure-King batteries to do their stipulated work, and resulted from causes entirely unconnected with the accumulators. I am glad to say, however, that I have been informed that arrangements are now in progress by which electrical broughams, fitted with the latest improvements and E.P.S. batteries, will shortly be available in London. I cannot conclude without referring to the death of our esteemed colleague, Mr. Frank King, and paying a tribute to the work carried out by him during the many years he was manager of the Company. To his organising ability, and his skill as an electrical engineer, eapecially in connection with accumulators, I consider the Company in large measure owes its present prosperous condition. He has left an impress of his energy and industry on the accumulator business generally, which I feel certain will preserve his memory for many years to come. In some respects the year just closed has been an anxious one for the Directors and the staff, but I trust that with the return of peace, prices will settle somewhat. Electric lighting and traction are being taken up all over the country on an ever-increasing scale, and as accumulators are now recognised as an essential element for economical working I think the future of the Company looks bright. I now move the adoption of the report and accounts.

The resolution was carried unanimously.

Mr. F. Green was re-elected a director, and the auditors having been re-appointed, a vote of thanks to the Chairman and Directors terminated the proceedings.

Eastern Telegraph Co. (Ltd.)

The report of the directors of this company for the half-year ended March 31st states that the revenue for the period amounted to £543,683. 18s. 2d., from which are deducted £128,072. 1s. 4d. for

Digitized by Google

ordinary expenses and £27,939. 17s. 9d. for expenditure relating to repairs and renewals of cables, &c. After providing £6,075. 7s. 1d. for depreciation of spare cable and £7,794. 8s. 1d. for income tax, there remains £373,802. 6s. 11d., to which is added £33,660. 3s. 4d. brought forward, making £407,462. 10s. 3d. From this there has been paid: Interest on mortgage debenture stock, £27,590. 16s. 1d.; dividends on preference stock, £30,946. 16s. 8d.; interim dividend of 1½ per cent. on ordinary stock, £50,000; leaving £298,924. 17s. 6d., out of which the directors have placed £10,000 to reserve for maintenance ships, £5.000 to reserve in connection with removal of head office, £2,000 to reserve fund for insurance of goods in transit, and £150,000 to general reserve. The directors now recommend a final dividend on the ordinary stock for the year ended March 31st of 1½ per cent. and a bonus of 2 per cent., amounting together to £130,000, payable 19th instant, tax free, and making, with the three previous payments on account, a total distribution of 7 per cent. for the year. The balance of £1,924. 17s. 6d. is to be carried forward. The revenue includes £26,039. 10s. dividends for the half-year on the company's shares in other telegraph companies.

The section of cable between Ascension and St. Vincent was completed on Feb. 22nd, providing, with the existing lines of the Western Telegraph Co. and this company, a third route to the Cape. Landing rights having now been granted, arrangements have been made for improving this route by laying a direct cable between St. Vincent and Porthcurnow, Cornwall, viâ Madeira.

An agreement has been concluded between the Eastern Extension Telegraph Co. and the Governments of South Australia, Western Australia and Tasmania for establishing, in conjunction with this company, direct cables between South Africa and Australia, viâ the islands of Mauritius, Rodrigues and Cocos to Perth, with an extension to Adelaide. The section between Durban and Mauritius will be laid by this company. It has also been arranged to lay a cable between Ascension and Sierra Leone under a subsidy from Her Majesty's Government. The order for the whole of these cables has been given, and they are in the process of manufacture.

In connection with these important extensions the tariff between the Colonies of South and Western Australia and Tasmania and Europe was reduced from 4s. 9d. to 4s. per word on May 1st, with proportionate reductions for Government and press telegrams. The agreement with the above Australasian Colonies also provides for future reductions under certain conditions to a minimum of 2s. 6d. per word. There will also be substantial reductions in the tariff between the contracting Colonies and South Africa when the new cables between Durban and Perth are completed.

The company's new cable-repairing steamer "John Pender" has been completed and placed in commission.

The company has subscribed £500 to the Mansion House Fund for the City Imperial Volunteers, £500 to the Indian Famine Relief Fund, and £500 to the Transvaal War Fund.

EDMUNDSON'S ELECTRICITY CORPORATION (LTD.)—A meeting of this company was held on Friday last. The chairman (Mr. John R. Wigham, J.P.) said: The profit for the year has been £17,260, against £11,267 last year. During the year the capital has been increased to £200,000, the full amount at present authorised. There has been also a further issue of debentures, making the total £75,000. A large item of £121,000, sundry debtors and advances to subsidiary companies, appears among our assets. The advance to subsidiary companies, which forms a large proportion of this item, represents money spent in connection with our various companies, in exchange for which we are entitled to get shares or debentures. There is another large item—investments at cost, £111,000. This represents shares and debentures in our various companies, taken at actual cost. The directors recommend a dividend of 6 per cent. on the ordinary and on the deferred shares, to write £5,000 off goodwill, and to carry forward £4,152. The progress which our various stations have been making during the year is, in nearly every case, beyond our expectations. This rapid increase has necessitated large extensions, and most of our work during the past year has been in the direction of such extensions, only a few new works having been commenced. We have, however, been able to secure powers for Grantham, Stamford, Twickenham, Bishop Auckland, Weybridge, and Redruth, and have practically secured a concession for an electric tramway between Redruth and Camborne, which will be worked in connection with their Redruth electricity station. Additional capital is required to meet our extending business, and it is proposed that the capital of the company be increased from £200,000 to £400,000, and that £100,000 be issued at once, as 6 per cent. preference capital. The directors' report was adopted, and resolutions approving the increase of capital afterwards approved.

GREENWOOD & BATLEY (LTD.)—The annual meeting was held on Tuesday. The chairman (Mr. Arthur Greenwood) moved the adoption of the report (an abstract of which appeared in our last issue). He expressed regret that the results of the year's working were not more favourable. Their business was a special one, and success was dependent upon its various branches being fully occupied. Their general engineering tool trade had been well employed. Other departments had not, however, been fully occupied. They had tried to find not only new markets, but new manufactures to offer in these markets, and considered that the electrical branch was that to which they must now look to make up the loss of work in other departments. This branch was making sound and steady progress, and had increased year by year. He felt that to this branch they must look for their future success, both in obtaining orders and in realising profits. At the last meeting he spoke of the De Laval steam turbine, in which the company had taken a large interest, and he was glad to report a successful development of this branch. Dividends at the rate of 7 per cent. per annum on the preference and of 2½ per cent. on the ordinary shares were declared.

NEW COMPANIES, STATUTORY RETURNS, &c.

ANTI-COLLISION ALARM TELEGRAPH CO. (LTD.)—This company was registered on June 28, with a capital of £1,500, in £1 shares, to adopt an agreement with Thomas Bell, and to acquire and develop any inventions, patents, &c. The subscribers are A. W. Higgs, R. White, I. Bridge (engineer), C. Geddes (engineer), C. J. Copeland (consulting engineer), G. A. Harradon, and J. Taylor (engineer).

DOE PORTABLE ELECTRIC LIGHT AND POWER SYNDICATE (LTD.)—This company was registered on July 3, with a capital of £40,000, in £1 shares, to a quire certain inventions relating to galvanic batteries, to enter into an agreement with a company of the same name, and to carry on the business of electrical engineers, electricians, suppliers of electric light and power, &c.

IMPROVED ELECTRIC GLOW LAMP CO. (LTD.)—This company was registered on July 2, with a capital of £40,000, in £1 shares, to acquire the business carried on by a company of the same name, and to carry on the business of electrical and general engineers, electro-platers, lamp and electrical plant and fittings manufacturers, &c. The first directors are, F. L. Gardner, F. H. Bowman, H. N. Tennant and, A. Gaskell.

MIDDLESEX AND HERTFORD ELECTRIC LIGHTING & POWER CO. (LTD.)—This company was registered on June 30, with a capital of £100, in £1 shares, to carry on the business of electricians, electrical and mechanical engineers, suppliers of electricity for light, power and other purposes, &c. The subscribers are, D. J. Robertson, V. B. D. Cooper (civil and electrical engineer), Lieut. F. H. E. Shipton, R.N., M. N. Ridley (civil engineer), F. O. Smith, M.R.C.S., C. Crawshaw, and A. Toch.

NEW GENERAL TRACTION CO. (LTD.)—According to the annual return to May 30 the capital is £370,000, in 50,000 preference and 24,000 ordinary shares of £5 each, all of which have been taken up. £5 per share has been called up and paid on the preference shares. The ordinary shares are considered as fully paid.

ORIENTAL TELEPHONE AND ELECTRIC CO. (LTD.)—The annual return to May 9 gives the capital as £200,000, in £1 shares, 171,504 of which have been taken up. £1 per share has been called up and paid on seven shares, and £171,497 is considered as paid on the remainder.

WEST COAST OF AMERICA TELEGRAPH CO. (LTD.)—The annual return to May 22 has been filed. The capital is £132,520, in 53,008 shares of £2. 10s. each, 45,008 of which have been taken up. £2. 10s. has been called up on each of eight shares. £112,500 is considered as paid on 45,000 shares.

WESTERN TELEGRAPH CO. (LTD.)—The annual return to May 23 has been filed. The capital is £2,500,000, in 250,000 shares of £10 each, 207,930 of which have been taken up. £10 has been called up and paid on each of 130,000 shares, and 77,930 shares are considered as fully paid.

WYCOMBE BOROUGH ELECTRIC LIGHT & POWER CO. (LTD.)—The annual return to May 9 gives the capital as £30,000, in 6,000 shares of £5 each, 2,020 of which have been taken up.

CITY NOTES.

MEMORANDA.—Bank rate 3 per cent. (since June 14, 1900). Price of silver 28 1/16d. per oz. (July 12). Consols (2½ per cent.) 99½—99⅝ for money, 99 15/16—99 31/32 for account; 2½ per cent. 98½—99½ (July 12). Stock Exchange Settling Day: Consols, Aug. 2; Stocks and Shares Continuation Days, July 25 and Aug. 13; Ticket Days, July 26 and Aug. 14; Pay Day, July 27; Mining Share Carry-over Days, July 24 and Aug. 11.

W. H. ALLEN, SON & CO. (LTD.)—The business of the well known engineering firm of Messrs. W. H. Allen, Son & Co., Queen's Engineering Works, Bedford, has been converted into a limited liability company. Particulars of the registration were given in our last issue (p. 424), but the title of the company was incorrectly given as W. H. Allen & Sons (Ltd.). The correct title is as above.

BROMLEY (KENT) ELECTRIC LIGHT & POWER CO. (LTD.)—An extraordinary meeting was held last week authorising the increase of the capital of the company to £50,000.

CALCUTTA TRAMWAYS CO. (LTD.)—The report of the directors for the year ended Dec. 31 states that the contract for the electrical equipment of the lines has been concluded with Messrs. Dick, Kerr & Co. for a sum not to exceed £170,000, to include the whole of the electrical requirements, but not the buildings. The subscriptions to the issue of £250,000 4½ per cent. debenture stock offered for public subscription on March 26 last were satisfactory, and the company is now in possession of ample funds for its present needs. Since active measures have been taken for the conversion of the lines to electric traction numerous applications have been made for extensions in various directions, and these applications are receiving careful consideration.

CAPE ELECTRIC TRAMWAYS (LTD.)—An interim dividend of 5 per cent., tax free, has been declared.

CROMPTON & CO. (LTD.)—A dividend at the rate of 9 per cent. per annum for the half-year (tax free) will be proposed at the forthcoming general meeting of this company, making, with the interim paid in January, 7½ per cent. for the year. £12,000 is added to reserve.

DIRECT UNITED STATES CABLE CO. (LTD.)—A final dividend of 5s. per share and a bonus of 2s. per share (both tax free) is recommended payable 31st inst., making, with the three interim dividends already paid,

Digitized by Google

a total distribution of 3½ per cent. for the year to June 30. £10,000 is placed to reserve and about £3,700 carried forward. The transfer books will be closed from 10th to 24th inst. inclusive.

GLOBE TELEGRAPH & TRUST CO. (LTD.)—The financial papers announce that the directors of this company have declared a dividend of 4s. 6d. per share on the ordinary shares, making, with previous distributions, 5½ per cent. for the year.

NATIONAL TELEPHONE CO.—The transfer books of the preference and ordinary shares will be closed from 16th to 26th inst. inclusive, preparatory to the payment of dividend for the half-year to June 30.

ST. JAMES' & PALL MALL ELECTRIC LIGHT CO. (LTD.)—The directors have declared an interim dividend on the preference shares at the rate of 7 per cent. per annum, and on the ordinary shares at the rate of 10 per cent. per annum for the half-year ended June 30. The share transfer books are closed from July 18 to Aug. 1 inclusive. The amount of electricity sold during the quarter ended Midsummer, 1900, is returned at 1,035,927 units, estimated to produce £18,474, against 817,642 units, which produced £14,751, for the corresponding period of last year.

SOCIETE ANONYME BELGE D'ELECTRICITE.—This company has just been formed to take over the Brussels branch of the Allgemeine Elektricitäts Gesellschaft of Berlin.

SOUTH STAFFORDSHIRE TRAMWAYS CO. (LTD.)—A dividend of 2s. 5d. per share on the preference shares has been declared.

STOCK EXCHANGE NOTICES.—The Stock Exchange committee has ordered the provisional certificates for £100,000 5 per cent. second debenture stock of the *Edison & Swan United Electric Light Co. (Ltd.)* to be quoted in the Official List. Application has been made to the committee to appoint a special settling day in and to grant a quotation to the further issue of £125,000 3½ per cent. mortgage debenture stock of the *Metropolitan Electric Supply Co. (Ltd.)*, and to allow 20,000 £10 fully-paid 7 per cent. cumulative preference shares (Nos. 1 to 20,000) of the *British Aluminium Co. (Ltd.)* to be quoted in the Official List. The latter is a renewed application.

TELEGRAPH CONSTRUCTION AND MAINTENANCE CO. (LTD.)—The transfer books of this company will be closed from 9th to 17th inst. inclusive preparatory to the payment of an interim dividend of 12s. per share.

UNITED RIVER PLATE TELEPHONE CO. (LTD.)—Subscriptions were this week invited for 23,361 £5 5 per cent. cumulative preference shares at par (balance of 40,000 shares), to provide capital for putting the company's cables at Buenos Ayres underground.

NOTES.

MORE than usual interest attaches to the statement of the Marquis of TWEEDDALE at yesterday's meeting of the stockholders of the Eastern Telegraph Co. His graphic *résumé* of the progress of the company since the amalgamation in 1872 showed the uniformly comprehensive grasp of the telegraphic situation by the directorate. Without resulting in undue profits, the policy maintained has enabled the stockholders to reap a moderate reward for their confidence. No small measure of the success of the Eastern and associated Telegraph Companies is due to the personality of the chairman, the Marquis of TWEEDDALE, who has been associated with submarine telegraphy for over 30 years, and the announcement of his resignation must have come almost as a shock. The full report, which appears on another page, gives his lordship's reasons for this step, and it only remains to be said that all acquainted with the noble Marquis will be gratified that, by his retention of a seat on the Board of Directors, his connection with submarine telegraphy has not been wholly severed. It says much for Sir JOHN WOLFE BARRY that, after only a short association with the directorate, he should have been unanimously selected to succeed the Marquis of TWEEDDALE as chairman of this great undertaking.

THE action of light on magnetism is the natural corollary of the action of magnetism on light, as disclosed in the Faraday and Zeeman effects. But converse Faraday or Zeeman effects have not yet been obtained, and the only experiments hitherto described which show some influence of light upon magnetisation are those of BIDWELL. These were made in 1889. He brought iron bars into a peculiarly sensitive state by heating, magnetising, and demagnetising them in such a manner that their susceptibility in one direction was greater than their susceptibility in the opposite direction. He then found that their magnetisation in a magnetic field was facilitated by the action of light, and also their demagnetisation on the cessation of the field. But the same effects were produced by mechanical action, and it is doubtful whether we have here the case of a pure action of light at all. We have certainly not to deal with any magnetic action such as would follow from the electromagnetic theory of light. In the current number of the *American Journal of Science*, however, Mr. J. H. HART announces that he has obtained a distinct effect of light on the demagnetisation of thin iron films deposited upon glass by a cathode discharge. These, as we know, are extremely difficult to demagnetise or reverse. Light polarised in a plane containing the magnetic axis had, however, a strongly demagnetising effect, and light polarised in a direction normal to it a distinctly feebler effect.

AT the recent convention of the Municipal Electrical Association, during one of the discussions, the question was debated as to the suitability of the gas engine as a means for pioneering electricity supply in areas of small or moderately large size. The question was raised in Mr. VESEY BROWN'S Paper on "Electricity Supply for Small Towns," the author recommending local authorities who own gasworks "to lay down a network of distributing mains and instal a gas engine plant to the extent of, probably, 150 kilowatts as a pioneer undertaking, and, if the demand requires, then to put up a steam generating station." This recommendation was dissented from totally by Mr. BOOT, of Tunbridge Wells, who considered gas-engine stations a failure, and partially by Mr. COLLINGS BISHOP, of Wigan, whose experience at the Leyton gas-driven electricity station, he said, had taught him that a station of this type should only be erected where the demand was not only initially small but was likely to remain small. At Leyton, steam plant has been adopted for the larger works necessitated by the increased demand for current. The practice at Belfast has been in a similar direction. Coatbridge long ago exchanged its gas engines for steam plant; while out of its many vicissitudes Morecambe has also emerged with a steam-driven station. Can any good, then, be said for the gas engine as the mainstay of any small electricity works?

SOME years ago, when the practice of using gas engines was newer and less understood than at present, we published a series of descriptions of the few stations of this

Digitized by Google

type then in existence (see *The Electrician*, Vol. XXXV.) Although at that time the gas-driven station was under a depressing cloud, chiefly owing to the ill-luck with gas plant at Morecambe and Coatbridge, we were able to produce evidence fully supporting the view we expressed, that the gas-engine station was not essentially a failure. In each and every case the want of success arose from contingencies which had a purely local character. There appeared nothing whatever to condemn the gas-driven station as an engineering mistake or a financial failure; and besides accounting in every instance for the individual failures, we were able to point to actual examples of really successful gas-driven electricity works. The admirably equipped station belonging to the Midland Railway Co., which supplies current for lighting the railway stations and yards at Leicester, was one of the instances cited; and the uniformly successful career of this station since that date is further proof of the correctness of our conclusions. Indeed, it is not possible for any competent engineer to go carefully into this question without being greatly impressed with the numerous advantages gas-driving possesses over steam-driving in certain combinations of circumstances which are of by no means rare occurrence. Mr. Vesey Brown is certainly justified in pressing its claims upon the attention of local authorities who are the owners of gasworks. It is probable that it may also safely be recommended to local authorities who do not own and supply gas; for one of the cheapest methods of running a gas-driven station, where the necessary fuel can be obtained at a moderate price, is to use the Dowson gas generator.

The question that is uppermost in our mind at present, however, is not the practicability of running a gas-driven station, but the local conditions which justify this practice. Is the gas-driven station, in fact, only to be used where the demand for electricity must always be within the somewhat narrow limits of good gas-station practice; or, may not the gas engine be used as the "thin edge of the wedge"—the pioneer, in small beginnings, of great things to come? In other words, does it pay to lay down gas engines first, and later, when the load has grown large, to replace these with steam plant? Opinions differ, but we are disposed to believe that in many cases it would pay to do so. It is contended, in opposition to this view, that the replacement of gas plant by steam plant would overload the capital account of the works. This ignores the fact that there is always a ready market for second-hand gas plant that has been well cared for; moreover, in steam-driven stations, where very small beginnings are made, the steam plant is often too small in size to be of real use when the works require to be greatly extended. In either case, therefore, a certain amount of plant usually must be got rid of. But the chief recommendation of the gas engine over the steam engine, for small pioneer work, is the simplicity and comparative insignificance of the experiment. Little capital is risked in putting down a gas engine and dynamo on the gas works, or on any cheap convenient site; much more elaborate, however, and costly is the experiment of erecting a steam-engine station. Moreover, on the almost toy scale of pioneer work in villages and small towns the works costs with gas-driving can be kept down to a much lower figure than with a steam engine, especially where a storage battery is erected so that the station need be run only a few hours daily.

Questions of law are continually arising as to the relative rights of the Post Office, National Telephone Co., and local authorities as telephone caterers to the general public. The dispute as to underground wires in the metropolis must be held responsible for a great part of the £25,000 referred to in another column as having been spent by the National Telephone Co. in repairing their wires after the disastrous snowstorm last February. At a recent discussion on municipal telephony at Huddersfield, in which the Council decided to apply for a telephone licence, Ald. Calvert is reported to have said, "there could be no doubt that Huddersfield or any other municipality would be able to use the National Telephone Co's wires in other towns if their messages went over the trunk lines," this statement being supported by the town clerk. We are by no means certain that the views of these two gentlemen are correct. The company has a right to charge terminal fees for effecting a connection between a trunk wire and one of their own subscribers; and if, for instance, the company raised to a prohibitive figure the terminal fee charged to callers attached to municipal exchanges, at the same time absolving their own subscribers from such fees, they would hardly, we think, be exceeding their legal rights. After all, it would be only fair that the supporters of a movement which has prevented the metropolitan system from being perfected by the use of underground wires throughout should be made to contribute, if only in the form of high terminal fees, to the costly repairs inseparable from an overhead system in a large town.

Personal.—Lord Kelvin has been elected Master of the Worshipful Company of Clothworkers for the year 1900-1901.

Institution of Junior Engineers.—A visit will be paid to the generating station and depôt of the Central London Railway at Shepherd's Bush, on Friday next, the 27th inst., at 6 30 p.m.

Electrical Engineers (R.E.) Volunteers.—Among the prisoners of war unconditionally released, and now at Ladysmith, are Sappers D. F. Colson, R. Peart, C. E. Landon and E. M. Sellon.

University College, London.—The 1900-1901 session will commence on Oct. 2. Some particulars of the course of instruction given in electrical and mechanical engineering, &c., are given in an advertisement.

Durham College of Science.—Complete courses in instruction are provided at this college for science students. Special facilities are offered for the study of applied chemistry, mining and all branches of engineering. The course of lectures begin on Oct. 8.

Civil List Pensions.—Among the Civil List pensions granted during the year ended June 20, 1900, are the following: Mr. C. J. Wollaston (£100), in recognition of his services in connection with the introduction of submarine telegraphy; and Mr. R. Tucker (£40), in consideration of his services in promoting the study of mathematics.

Cable Interruptions:—

	Date of Interruption.
Latakia—Cyprus	June 21, 1899
Cayenne—Pinhieros	Oct. 11, 1899
Tangier—Tarifa	Jan. 3, 1900
Paramaribo—Cayenne	Feb. 16, 1900
Ceara—Maranham	Feb. 20, 1900
Pará—Maranham	Mar. 2, 1900
Môle-St. Nicolas—Cap Haitien	Mar. 7, 1900

Central London Railway.—In the description of the exciter sets on page 433 of our last issue, it should have been stated

Digitized by Google

that each exciter set consists of a vertical enclosed tandem compound engine directly coupled to a multipolar continuous-current generator, both engine and generator being of the "Thomson-Houston" standard type. Also, in the first line of column 2 of the same page read "Thomson-Houston" instead of "Westinghouse."

Society of Model Engineers.—The fourth monthly meeting of the Liverpool Branch of the Society of Model Engineers was held at the Balfour Institute, on July 4th, when a very fine collection of models was on view, and Mr. Hastings gave an interesting description of the engine of his new model torpedo boat. The next meeting will be held in the recreation room at the Balfour Institute, Smithdown-road, Liverpool, on August 1st., at 7·45 p.m., when another exhibition of models will be held, and a general discussion will take place on any difficulties experienced by members in connection with their work.

University of Birmingham.—At a meeting of the Council of the University of Birmingham on Wednesday, under the presidency of the Vice-Chancellor, the offer of 25 acres of land by Lord Calthorpe and his son as a site for the new scientific department which it is proposed to establish, was announced by the reading of letters from the Right Hon. J. Chamberlain and Lord Calthorpe. Mr. Chamberlain said he sincerely trusted that Lord Calthorpe's example would find many imitators, and pointed out, as especially worthy of the consideration of generous donors, the desirability of establishing schools of mining, railway and engineering, metallurgy, and technical instruction in pottery and glass manufacture. A resolution was then passed expressing the Council's high appreciation of the gift. The chief condition attached to the gift is that the University shall pay a share of the cost of building a new road, which will be rendered necessary in order to facilitate communication with Birmingham.

Society of Chemical Industry.—The annual general meeting of the Society of Chemical Industry took place on Wednesday in the lecture theatre of the Royal Institution. Prof. Chandler, of New York, who is president for the year, devoted his address chiefly to the subject of technical education. The most striking feature of the American system of technical education was that most of the technical colleges had been founded and were maintained by gifts of money from wealthy citizens In 1899 in that country there were 9,784 students pursuing professional courses in the schools of engineering, and 1,487 of these graduated during the year, receiving the degree of civil, mechanical, electrical, or mining engineer. In his address Prof. Chandler also referred to the progress made in electro-chemistry, alluding to the methods adopted for the reduction of aluminium in the manufacture of carborundum and artificial graphite. Mr. J. W. Swan has been elected President of the Society for next year, and Glasgow has been chosen as the place for the annual general meeting.

Southport Corporation Tramways.—A system of 6 miles of electric tramways was formally opened at Southport on Wednesday, the ceremony being followed by a luncheon to which the chairman and members of the Tramways committee had invited a large number of ladies and gentlemen. The lines are chiefly single track and are operated on the overhead trolley system, current being supplied by a continuous-current generating set, which has been added to the corporation electricity works. On the previous day the lines had been inspected by Mr. A. P. Trotter for the Board of Trade, and Mr. Trotter expressed his satisfaction with them generally, except with regard to some details in the overhead equipment, which he directed to be altered, chiefly in the disposition of some of the guard wires and anchor wires. Mr. Trotter also held an enquiry on behalf of the Board of Trade as to the application of the Southport Corporation to borrow £40,000 for the extension of their tramway system. There was no opposition to the proposal, and the evidence obtained at the enquiry will be reported to the Board of Trade in the usual manner.

Institution of Electrical Engineers—Students' Section.—A circular-letter has this week been addressed to the students of the Institution of Electrical Engineers informing them that the Council of the Institution proposes to grant £5 to each of 20 selected students to assist them to visit the electrical exhibits in the Paris Exhibition. Intending candidates must fill up and return an application form (issued with the circular) before 10 a.m. on Saturday, July 28. In the selection, the Council will give preference, other things being equal, to those who being still students of the Institution have either, or both, read Papers before the Students' Section, or been members of the committee of that section. The conditions of the grant are as follows :—

1. The selected student shall spend at least six days in Paris, the visit to commence not earlier than Aug. 27.

2. He shall write an essay or a Paper on the exhibits in a special section allotted to him, and shall send the Paper to the secretary of the Institution before Nov. 15, 1900.

The Paper submitted shall, like all other Papers presented to the Institution, become the property of the Institution. If approved by the Council it may be read at a meeting of the students' section, and, if so read, will be eligible for the usual Institution premiums offered for such Papers.

Visit of the American Institute of Electrical Engineers to England.—Mr. W. G. McMillan, the Secretary of the Institution of Electrical Engineers, is sending out the following circular to members :—

VISIT OF AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS, AUG. 12 TO 14.

It is expected that many members of the American Institute of Electrical Engineers will accept the invitation of this Institution to spend a few days in London on their way to our joint meeting in Paris on Aug. 16. Arrangements are in progress for: (*a.*) A trip up the Thames in electric launches from a starting point to be reached by railway, with a luncheon at a riverside hotel, on Sunday, Aug. 12. The price of tickets will depend upon arrangements now in progress, but will not exceed £2. 2s. each, it is hoped that it will be considerably less. (*b.*) A Dinner in London on the evening of Monday, Aug. 13. Price of tickets about 25s., inclusive of wine. (*c.*) Visits to works in and around London on Monday and Tuesday, Aug. 13 and 14. It is hoped that ladies will accompany members both on the river trip and at the dinner. In order that a true British welcome may be given to our guests, the Council hopes that a large number of members and of ladies may take part in the river trip and in the dinner. Before they can complete arrangements it is necessary, however, to know how many to provide for.

We have also been notified that the subject for discussion at the joint meeting of the Institution of Electrical Engineers and the American Institute of Electrical Engineers, to be held in the American Pavilion in the Paris Exhibition on the morning of Thursday, Aug. 15, is : "The Relative Advantages of Alternate and Continuous Current for a General Supply of Electricity, Especially with Regard to Interference with Other Interests." We understand it is specially desired to discuss how far interference with other undertakings, rather than ordinary commercial and industrial conditions, will come to be a determining factor in the selection between continuous and alternating currents.

The Northampton Institute.—A prospectus just received discloses a new departure at this technical institute. Engineering day courses are to be instituted, divided into three departments—viz., mechanical engineering, electrical engineering, and horological engineering. In each of these departments the work consists of lectures, exercise classes, laboratory work, and drawing office and workshop practice, and each department is divided into two sections, fairly elementary and more advanced. Thus in the mechanical department the aim is to give all-round training in the fundamental principles of modern mechanical engineering practice, and in the second part of the course special attention is to be devoted to the design and application of automatic machinery. In the electrical engineering department the first part of the course will train students in the ordinary work of electric lighting and power distribution, whereas in the more advanced course special attention will be devoted to electric traction and electro-chemistry. In the horological engineering a larger proportion of time than in the other departments will be given to workshop practice, and the students will be specially trained in the details of automatic tools. The courses are intended for students who desire a good technical training either before or after their apprenticeship in an engineering works, and also as a preparatory to higher technical instruction. The entrance examination will be held on September 26th and 27th, the results being made known on September 29th. The session will open on October 1st. Dr. R. M. Walmsley, the principal, will be pleased to give further information to intending students.

THE PARIS EXHIBITION.—I.

(BY OUR SPECIAL CORRESPONDENT.)

Electricity plays undoubtedly the most important part in the Paris Exhibition of 1900; and this would be the case even without the large display of electrical apparatus and machinery on view from all countries. The exhibition is lighted by electricity; electric power is freely supplied to all exhibitors who desire it for motive power; the inclined elevators, the moving platform and the railways, which convey visitors from one part of the exhibition to another, are all electrically driven; and the great attraction of the evening is the electrical illumination of the grounds, the façades of some of the buildings and the "Porte Monumentale," the outline of the Eiffel tower, and the "Château d'Eau" with its fountains. This last item, the illuminations, is by no means unimportant, and is one of the finest features of the exhibition. It is no mere vulgar blaze of light, nor is it a combination of praiseworthy individual efforts, each made without regard to harmony or contrast; the whole is carried out on an enormous scale, and at the same time so artistically that the result surpasses in beauty anything of its kind ever attempted before. It is useless to try to give an idea of this work of art by stating the number of lamps employed or by photographic records, for it is one of those things that must be seen to be appreciated at its full value.

It will be as well to commence this series of articles with an indication of the configuration of the exhibition, and the positions of those portions of greatest interest to the electrical engineer. Then will follow descriptions of the supply system of the exhibition, and an enumeration of the prominent features of the various systems of transportation. The account of the individual exhibits (and, in fact, the whole of these articles more or less) must be regarded as nothing but notes, for it would be obviously impossible, for reasons of space, even if it were likely to be of general interest, to enter minutely into every detail or to mention by name every exhibit and every exhibitor.

Fig. 1 is a map showing the general arrangement of the exhibition, and how the various sections are disposed. It omits, however, the section at Vincennes which is by itself at a distance of 5 or 6 miles from the Champ de Mars and includes railway and tramway material and rolling stock, automobiles and plant for manufacturing and utilising acetylene gas. The electrically-driven moving platform and the third-rail electric railway run round what may be termed the inner boundary of the exhibition. They both follow the same route, but run in inverse directions. Figs. 2 and 3 are views taken at different parts of the moving platform, the latter also giving a good view of the third-rail railway and an idea of the architectural beauties of the Italian pavilion in the Rue des Nations. A technical description of the platform will follow in a future article. For the present it will suffice to point out that it is in reality a combination of three platforms, clearly seen in Fig. 2. The part on the extreme left is stationary, that next to it is moving along at a speed corresponding to a slow walking pace, and the wider platform on the right moves at about twice the speed of the intermediate one. Access to the platform is obtained in some cases by an ordinary stairway, in others by an "inclined elevator"—that is to say, a kind of

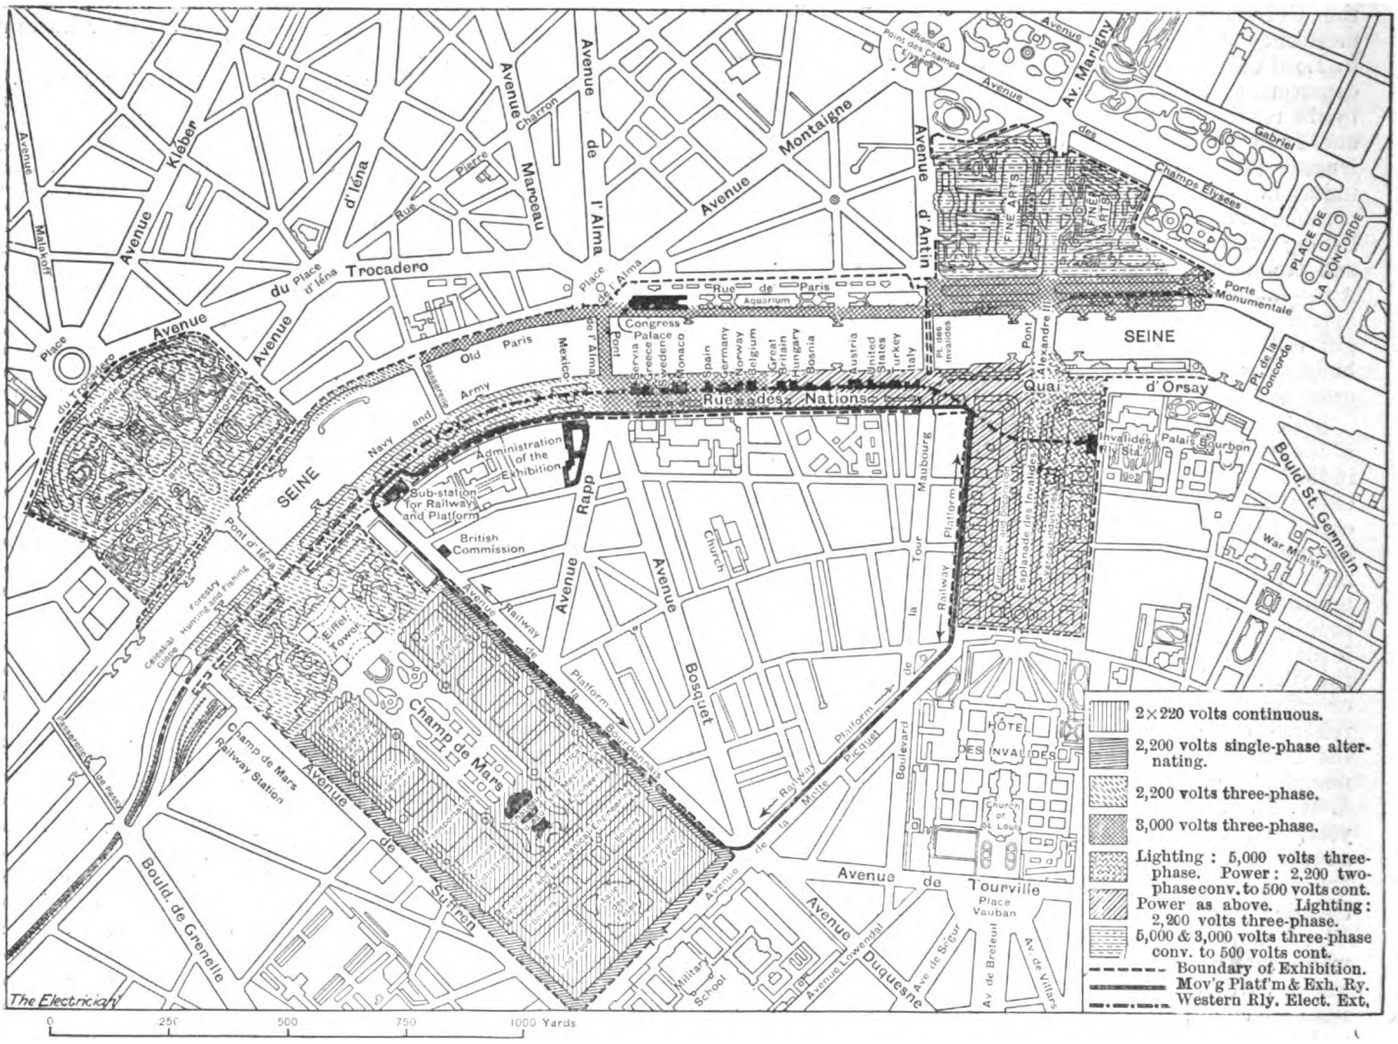

FIG. 1.—MAP OF PARIS EXHIBITION, SHOWING MOVING PLATFORM AND RAILWAYS, POSITION OF THE VARIOUS SECTIONS AND DISTRIBUTION OF SYSTEMS OF ELECTRIC SUPPLY.

Digitized by Google

narrow moving carpet, inclined at a fairly wide angle to the horizontal. Several examples of these elevators are to be seen in different parts of the exhibition. An under-

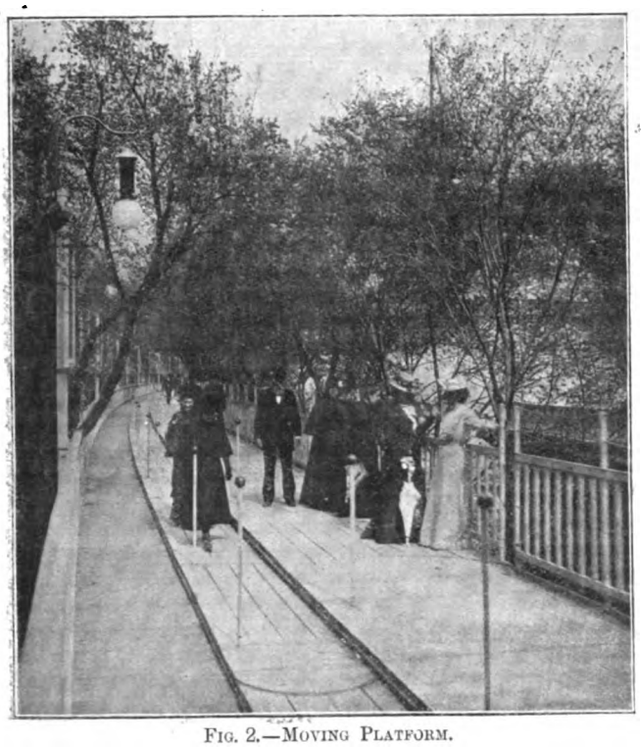

Fig. 2.—Moving Platform.

ground electric railway, which is to be permanent and to serve ultimately as an extension of the Western Railway of France to that part of Paris on the left bank of the Seine, at present runs only from the station in the Champs de Mars to the Invalides station at the other end of the exhibition. It is marked by a chain-dotted line in the map. A steam railway forming a branch line from the "Ceinture" railway runs to the same Champs de Mars station, and there is also railway communication with the intermediate station by the Pont de l'Alma from the St. Lazare railway station. The moving platform and the two electric railways obtain their current from a substation in the exhibition, the generating station being at Moulineaux 3 miles lower down the Seine.

The boundaries of the exhibition itself are indicated in the map by a dotted line. Just as in 1889, the main portion of the exhibition is in the Champs de Mars, in the middle of which is the Eiffel tower (which has for the occasion changed its dull red tint for a festive golden or gingerbread colour), and it is in this part that the electricity section is located. The Fine Arts section in the neighbourhood of the Champs Elysées and the Place de la Concorde, the various treasures on the Esplanade des Invalides, the already famous Rue des Nations in which are the "pavilions of the foreign powers," the lively Rue des Paris, in which those attending the Palais des Congrès in the daytime will seek a less intellectual if equally interesting entertainment in the evening, the fine military and naval exhibition on the bank of the Seine opposite to "Old Paris," and a picturesque solution of the Eastern question in the gardens of the Trocadero, all these must be visited; but it is only the electrical features of the exhibition that can be dealt with in these articles.

The front of the Palais de l'Electricité, shown in Fig. 6, is imposing, with the fine Château d'Eau, or water castle, in the centre. Although the two buildings are the work of different architects (M. Hénard and M. Paulin), they are in perfect harmony. The Château d'Eau may be described as Louis XV. style, and is rather heavier in its lines than the electricity building. It forms a series of basins, out of which cascades

Fig. 3.—Exhibition Railway and Moving Platform.

of water fall, and, from the miniature lake below, its fountains throw up jets of water to meet the floods pouring down from above. Unfortunately, the whole of this water display is not always offered to the public in the daytime; but at night, when the cascades and fountains are illuminated in constantly

Digitized by Google

changing colours, the effect is magnificent. The lace-like façade of the Palais de l'Electricité is well represented in our illustration. At night-time it is picked out with electric lamps, and then, as well as in the daytime, is one of the most pleasing

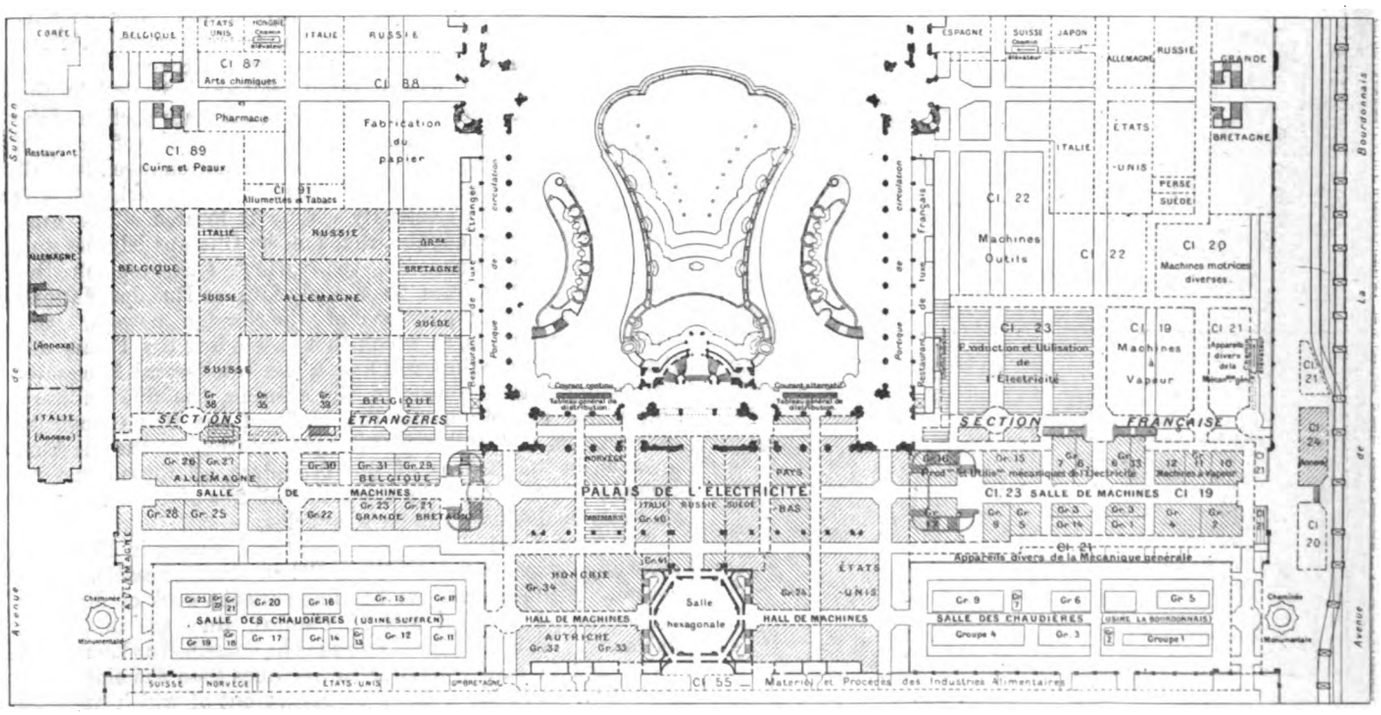

FIG. 4.—GROUND PLAN OF THE ELECTRICAL AND MECHANICAL ENGINEERING SECTION.

pieces of architecture in the exhibition. The Château d'Eau is surmounted by an allegorical figure representing "Humanity conducted by Progress advancing towards the Future and treading underfoot Routine and Hatred," and on the highest point of the electricity building is symbolised the genius of electricity standing erect in a car and brandishing the torch of progress.

being either by doors under the galleries facing the Château d'Eau on either side, when one first reaches a low dark corner of the large hall, beneath the gallery, or else at the top of an incline leading round the Château, giving access to the gallery at a part where no immediate view is afforded of the fine collection of machinery beneath. From other parts of the gallery, however, an excellent idea of the *ensemble* of the heavier electrical machinery can be obtained, for in this building the

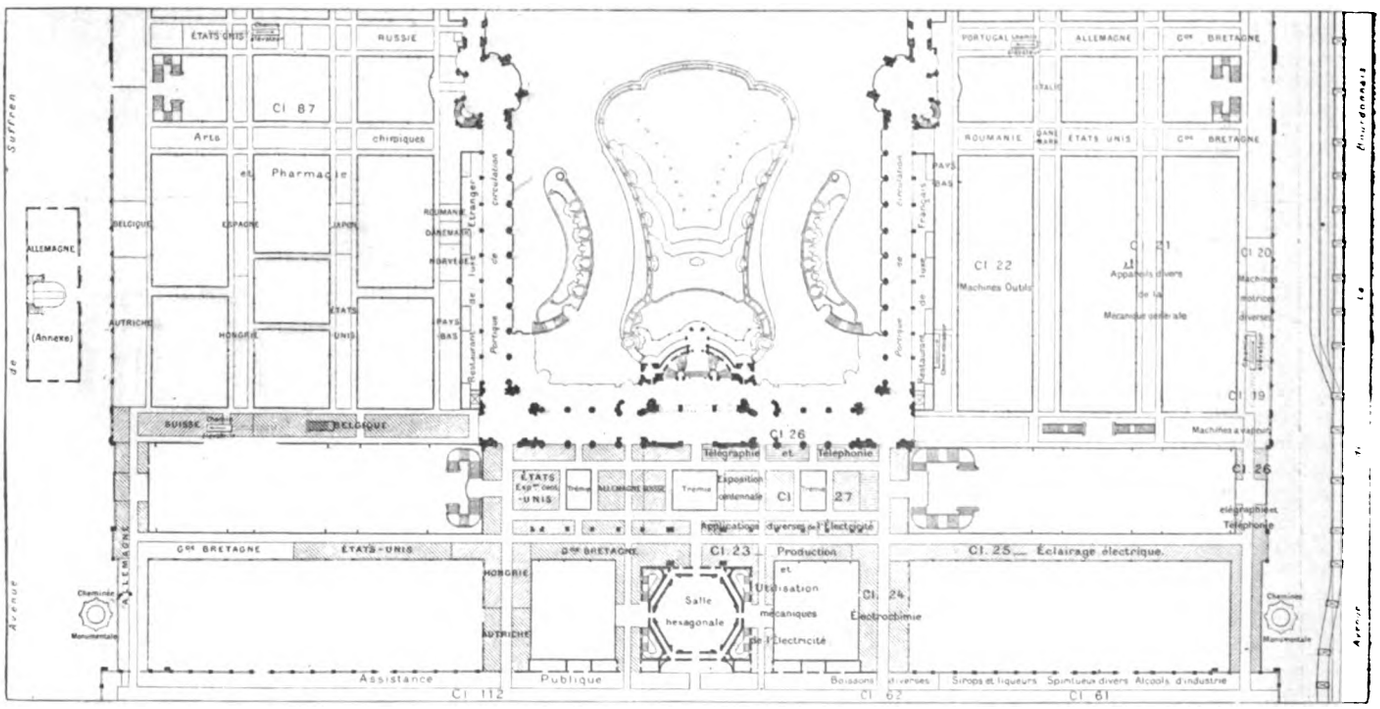

FIG. 5.—PLAN OF GALLERY.

Figs. 4 and 5 show the electrical and mechanical engineering sections within this palace. The entrance is disappointing, machinery generating current for the light and power service of the exhibition is situated, as well as that which is merely intended as an exhibit. On the gallery are the objects of a lighter and less bulky nature. The general arrangement on the ground floor is that the French machines are to the

Digitized by Google

left of the building, entering from the Château d'Eau (that is to the right hand in Figs. 5 and 6), and the British, German, Swiss, and Belgian machines to the right. The boilers are in two houses by themselves behind the electricity building. An "overflow" collection of German machinery, gathered around a huge 4,000 H.P. three-phase fly-wheel alternator, is held in a building marked "Allemagne Annexe" to the extreme left in Figs. 4 and 5. The United States occupies rather an unfavourable position in the centre of the main building, overshadowed by the gallery and immediately behind the Château d'Eau, but it is also represented by machines of American design in the French section; and in proximity to the United States exhibits in the centre and back of the ground floor are the Austrian, Hungarian, Italian, Russian, Swedish and Dutch machines.

The nearest entrances to the electricity section are those in the Avénue de la Motte Picquet, and near the ends of the Avénues de Suffren and de la Bourdonnais, but the visitor should not fail, on one occasion at least, to enter the exhibition by the Trocadero, in order to enjoy the magnificent *coup d'œil* of the whole of the Champ de Mars, with the Château d'Eau and the Palais d'Electricité in the background, the various smaller palaces to the right and left, and the gardens in the centre dominated by the huge but not ungraceful shape of the Eiffel tower. The next article will deal with the light and power supply within the exhibition.

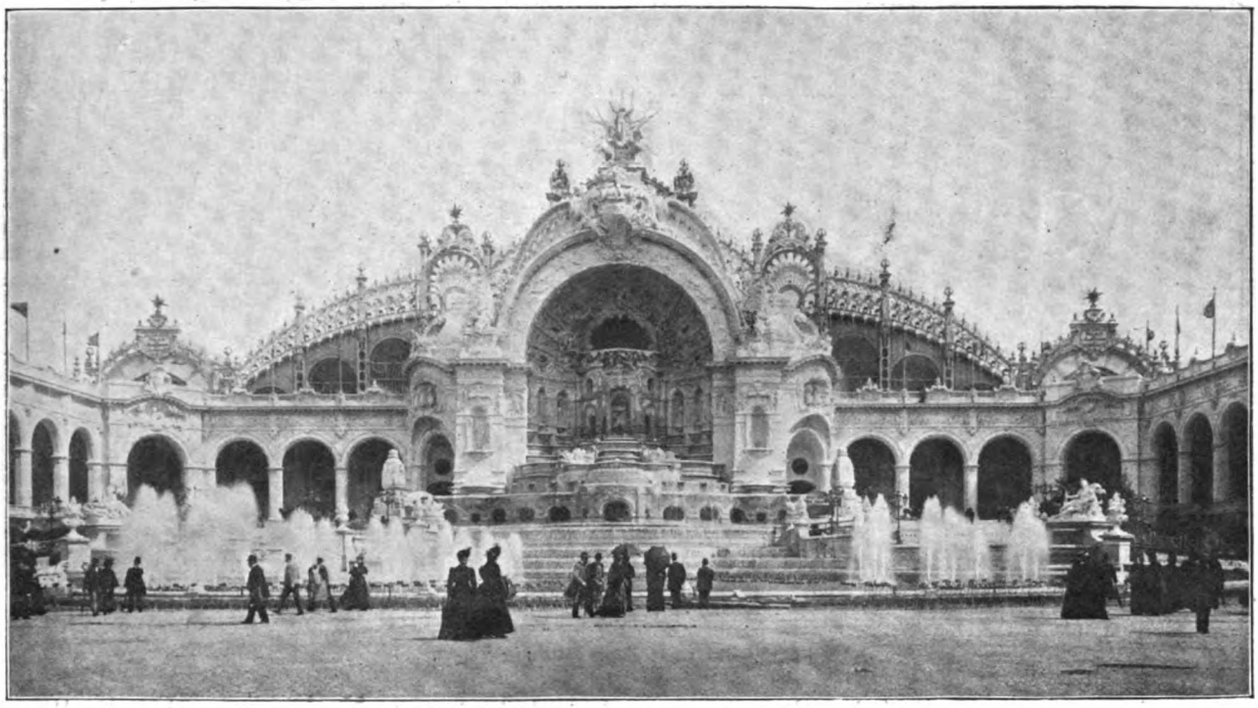

FIG. 6.—FRONT OF THE PALAIS DE L'ELECTRICITÉ AND THE CHÂTEAU D'EAU.

THE WORKS OF THE ST. HELENS CABLE CO.

The St. Helens Cable Co. is a development of the old-established St. Helens firm of wire drawers, W. J. Glover & Co., the new name having been adopted on the establishment of a factory for electrical cables and wires in Warrington. The new works at Warrington are those which will be of greater interest to our electrical engineering readers, as it is there that the copper wire and cable manufactured at St. Helens is converted into cable for electrical purposes. We will therefore commence our article with a description of these works, and follow this description with a brief account of the processes carried on at the wire-drawing works, although of course these should by right come first in order when relating the history of an electric cable.

The works at Warrington cover an area of 10,000 sq. yds. and are contained mainly in a large two-floor building. They are situated on the banks of the Mersey and adjoining the Warrington station of the London and North-Western Railway, and it is intended shortly to add a siding within the works themselves. Two hundred and seventy hands are employed, and almost all classes of cable are made there—paper, vulcanised bitumen, and indiarubber being employed as insulating materials, and the two latter compounds being manufactured from the raw material at the works. It is of interest to note that the works now occupied were at one time a rubber factory, but that all the old machinery has been swept away and has given place to new, the re-equipment of the works having been effected in six months. It was commenced last summer, and by January the company had already commenced the manufacture of insulated cable. Although in operation only six months, the works, we are informed, are working nearly at their full output and many of the machines are running on day and night shift. The firm's specialities include a lead-covered impregnated paper cable, claimed to be non-hygroscopic; a vulcanised rubber cable, in which the first layer of pure indiarubber is not applied in the usual way by lapping pure rubber strip, but in a novel manner (which the firm has requested us not to divulge in the present article); and an insulating matting formed of alternate layers of vulcanised indiarubber and impregnated paper, the last product being tested to 40,000 volts.

Starting from the manager's office on the first floor, above the general offices, we first come to the large and well-arranged braiding shop, illustrated in Fig. 1. Here are 120 braiding machines of the well-known fast-speed American type, placed in three rows. This class of braiding machine although running fast and making a braiding of good texture, will take bobbins of a fairly large size, so that one girl can attend to a maximum of eight machines. In the adjoining shop on the first floor are two disused pure rubber lapping machines and a set of five vertical stranding machines for the light wires up to 7/16 which are not stranded at the St. Helens works. In the same shop are two spreading machines for spreading the

Digitized by Google

insulating material on "proof" tape. One of these is interesting in that a steam jacketed drum replaces the register of steam pipes for drying and heating the cloth upon which

on the opposite side of the account must be set the fact that the cotton supplied in this way by the cotton manufacturer costs a fraction of a penny more per pound. All these

FIG. 1.—BRAIDING SHOP ON FIRST FLOOR.

the compound is spread. A fourth shop on this floor (Fig. 2) contains longitudinal rubber-covering machines and some taping machines for cables up to a certain size, and here also

machines are served by girls; the machines on the ground floor, on the other hand, being mostly for a heavier class of work, require as a rule male attendants.

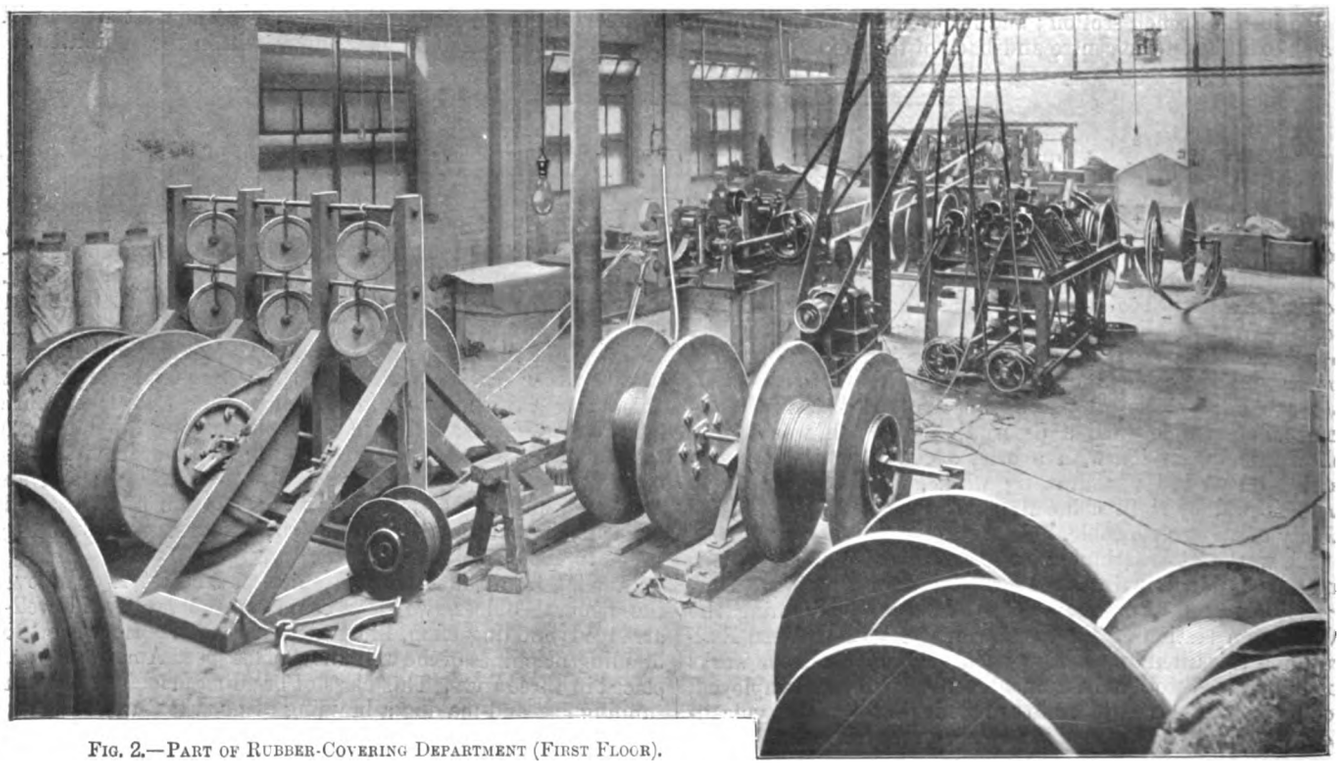

FIG. 2.—PART OF RUBBER-COVERING DEPARTMENT (FIRST FLOOR).

is the winding bench where the spools are wound for the braiding machines. The cotton is wound from larger spools not from skeins, this economising both time and space, while

On our way down we pass a well-provisioned dry store for indiarubber, in which the raw material is kept before use.

Six "washing machines" and four "mixers" first attract

Digitized by Google

attention at the foot of the stairs. In the former the pure rubber is scrubbed and dried, and in the latter it is mixed with the so-called "pigment" to convert it into the "compound rubber" suitable for vulcanising. This mass is then rolled out into thin sheets by steam-heated callenders, after which it is ready for being cut into strips for the rubber-covering machines. The latter, some of which are on the ground floor and others above, as already mentioned, are of the so-called longitudinal pattern, in which the rubber strip is passed over ridged rollers which wrap it round the conductor and cut it sharply, the freshly-cut rubber on the two sides cohering along a longitudinal seam, which disappears on vulcanisation. Close to the rubber-making machinery is a press for making rubber-canvas "insertion," the alternate layers of rubber and canvas being formed into a solid whole under pressure.

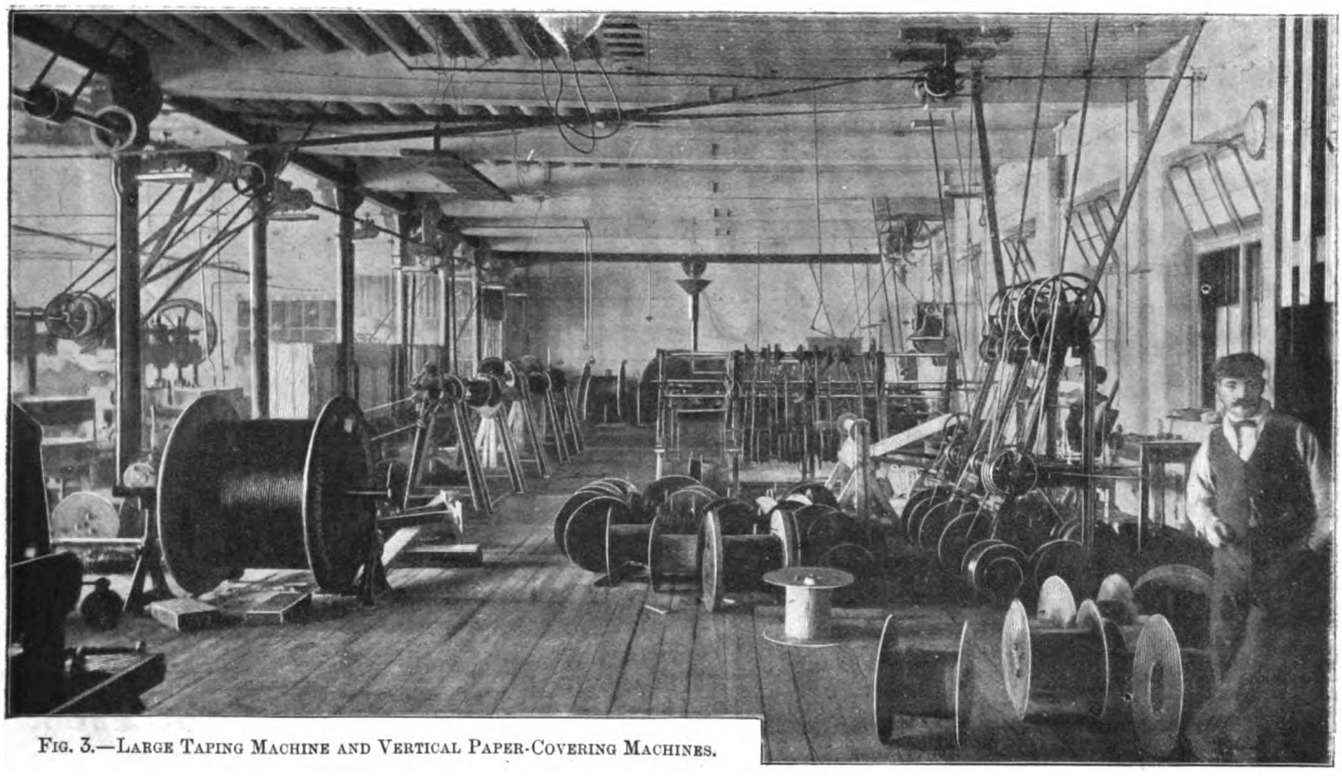

FIG. 3.—LARGE TAPING MACHINE AND VERTICAL PAPER-COVERING MACHINES.

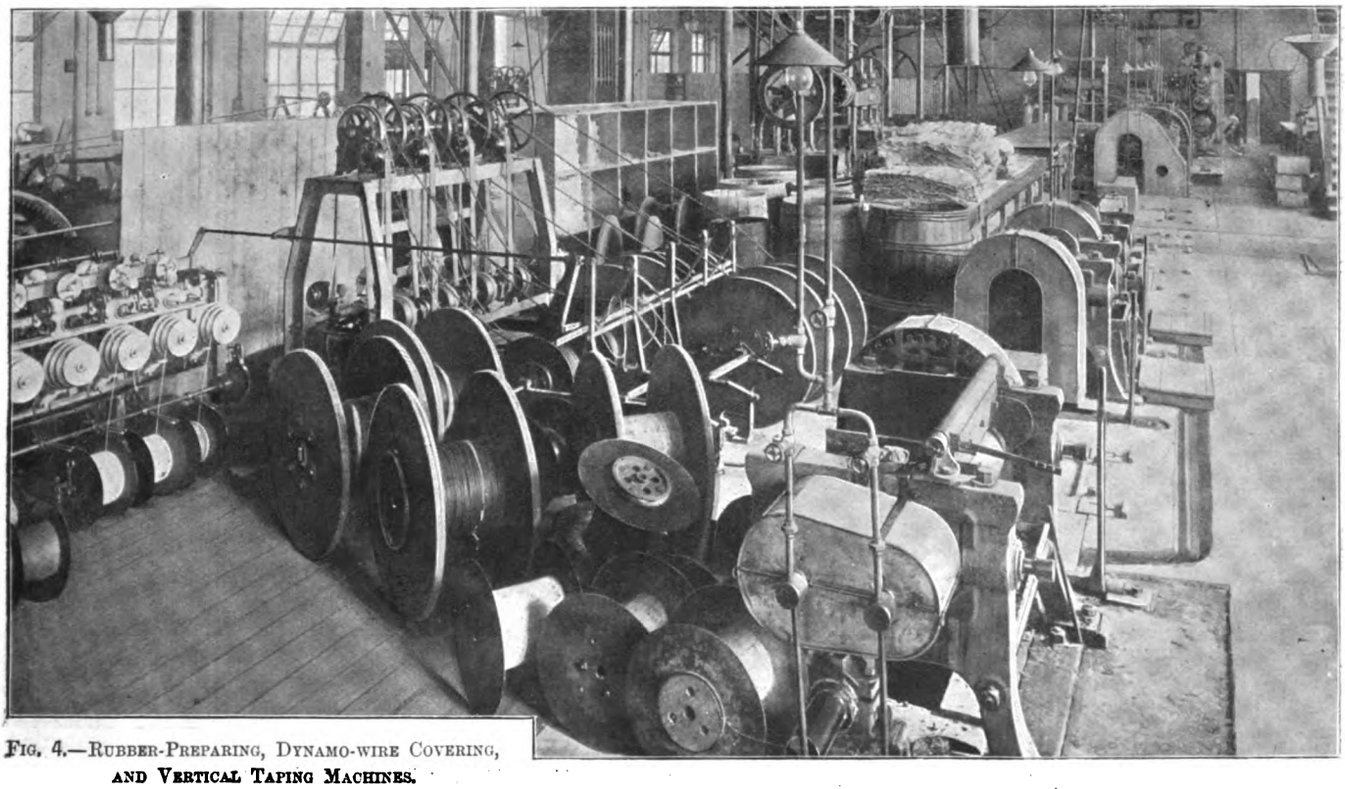

FIG. 4.—RUBBER-PREPARING, DYNAMO-WIRE COVERING, AND VERTICAL TAPING MACHINES.

The largest machine in this shop is a taping machine (seen in Fig. 3) with seven quadruple taping heads, one of which had been removed at the time of our visit. This machine will,

therefore, lay on 28 laps of tape in one operation if required. We noted that in this machine, as well as in the large serving machine which we shall refer to presently, the cast-iron standards supporting the bearings in which the heads revolve were merely bolted to the cement floor of the shop, and had not any bed plate. In this shop are also some vertical taping machines and a cotton-covering machine for dynamo wires seen in Fig. 4. The latter, on which six wires can be attended to by one girl, will cover with two reverse laps of cotton about 6 miles of dynamo wire (one mile on each pair of dapping heads) per diem.

In the second shop on the ground floor are six large braiding machines for heavier cable, two lead presses, impregnating tanks for paper cable, a large serving machine, a large stranding machine, some vertical paper-covering machines for telephone wires, horizontal machines for laying on vulcanised bitumen, the rubber vulcanisers, and some compounding tanks. The lead presses are of the hot type.

The cable is guided through a hollow steel point dipping into a die, between which a clearance is left equal to the desired thickness of lead covering. Lead in a plastic or semi-solidified state is pressed between the point and die by a vertical hydraulic ram. The hauling-off gear for the cable is driven by an electric motor, so that the attendant standing by the press can regulate the hydraulic pressure with one handle and the speed of the haul-off with another close to it. In the design of the press, made by Messrs. P. R. Jackson & Co., of Manchester, several new details are embodied, we understand, so that a point and die can be changed (to use the press for a cable of different size) in 10 minutes. The lead is melted in a small gas furnace above the container of the press, and to this furnace compressed air is supplied by a compressor driven by a motor through single-reduction spur gearing. Immediately behind each press is a horizontal cylindrical iron steam-jacketed impregnating tank for paper cables, so arranged that the cable is fed off directly from the tank to the press, as the

drum can revolve on a horizontal spindle within the cylinder. While the cables are being impregnated in these tanks before lead covering, the drum is also kept revolving to maintain a constant circulation of the compound.

The serving machine is especially interesting. The discs on which the spools of yarn are fixed, known as the serving heads, are placed one on each side of the standard supporting the bearing, and thus the machine is of less length than those constructed for the same work according to the usual practice hitherto. It has also a new feature in a little pump which pumps the hot compound from a tank on the floor up through a pipe bent downwards over the cable, so that the cable itself drawn merely through a scraping-off die and is not itself passed through the compound tank. This machine is constructed to take spools of the size and shape received from the jute manufacturer. Fig. 5 shows the vulcanisers, which are vertical cylindrical tanks in which drums containing the rubber cable for vulcanising are put. The drums are merely barrels with annular flanges, so that two or more can be placed concentrically in the tank at the same time. The tank is then closed and dry steam is kept circulating through it until the vulcanisation is complete. Fig. 6 is a large triple-tandem stranding machine, used for concentric cables and armouring. It is arranged so that any of the three parts can be worked separately, independently of the others.

Several of the machines in all the shops are electrically-driven, usually in groups from countershafting, and the works are lighted electrically. A 200 H.P. single-cylinder engine drives the main shafting, to which the shops can be belted instead of to their motors. In addition, there is a 60kw. Lister two-pole overtype continuous-current dynamo belted to an Alley & Maclellan engine, and a 15kw. Ganz machine which can generate continuous or alternating current. From the alternating-current slip-rings the current is led to a step-up transformer in the testing room, where it can be transformed up to 40,000 volts. The transformers, made by Ganz & Co., are in four parts, each transforming up to 10,000 volts, and in each air insulation, and not oil insulation, is used between the secondary and core and between the secondary and primary.

For measuring the pressure, a Kelvin volt balance is employed, the largest which it has been our privilege to see. It is constructed on the principle usually adopted in the construction of this instrument by Messrs. James White, of Glasgow—viz., that of a disc attached to the one beam of a balance, and attracted by a fixed plate on glass supports. On the other side of the fulcrum is a counter-weight and a pointer moving over a scale. Two different constants can be obtained by changing the weights, so that a range of reading from 5,000 volts to 100,000 volts is possible. The distance between the plates is about 5in. and the lower plate has a diameter of about 8½in. The diameter of the outer case, to prevent the possibility of brush discharge, is about 4ft., and the height of the instrument over all is about 5ft.

The remaining testing room equipment calls for little comment. It was satisfactory to note that d'Arsonval galvanometers are employed instead of the four-coil moving magnet instruments which ought to have had their day in cable testing rooms at all events.

At the St Helens works of the St. Helens Cable Co., both copper and steel wire is drawn and stranded. These works cover more ground than the Warrington works—18,000 sq. yds.—although they are not so capacious, having no first floor. The copper is received from the rolling mills in the form of "copper bolts," which are coils of copper rod of about ¼in. diameter. This is submitted to a succession of drawings and annealing, being reduced about 15 to 20 per cent. in diameter each "draft." After each annealing the wire is placed in a pickling bath to clean off the oxides, the copper "bolt" also being treated in this way before drawing.

In the first shop of the main building are the copper annealing furnace and the pickling tanks already mentioned. In the next shop is a machine for flattening wire for the outer conductors of concentric cables; the wire passes between two hard steel rollers, the pressure on the wire being regulated by screwing down the upper roller. A tinning bath, next to this, consists of an iron bath containing the molten tin, and supported on a brick furnace; the wire is led through the bath, and the superfluous tin is scraped off by passing the wire through an iron die. Opposite the tinning bath is a "continuous" wire-drawing machine, of American design, the wire passing through a succession of six dies.

Next come the galvanising shop and another cleaning house, and beyond this the main wire-drawing shop (Fig. 7). The coil of wire or bolt is placed on a swift and drawn off cold through hard steel dies, the adjustment of which by means of a hammer and a set of punches to the exact diameter requires a considerable amount of skill.

There are in all 50 wire-drawing blocks, and in the stranding shop 14 stranding machines of various sizes. These are of the usual pattern, designed for quick running. Fig. 8 shows about half of the shop. The machines, as well as the wire-drawing blocks are driven from countershafting beneath the floor, and the engine (a 140 H.P. vertical compound with trip gear) is in a shed by itself. Its flywheel drives a transmission shaft through single-reduction spur gearing, the shaft passing underground to the main building.

One hundred and twenty hands are employed at the St. Helens works. Mr. W. J. Glover is the managing director of the works, and his cousin, Mr. R. B. Glover, manager. To the first-mentioned of these gentlemen and to Mr. Heyl-Dia, managing director of the Warrington works, our thanks are due for showing us over the two factories and patiently answering numerous questions. Cable is required for electrical work all over the country and in the colonies at a greater rate than ever, and there is plenty of room in the industry for energetic and enterprising works such as the St. Helens Cable Co. We wish the new works every success.

NOTES ON THE MAINTENANCE OF MOTORS ON HIRE FROM AN ELECTRICITY WORKS.*

BY C. A. L. PRUSSMAN.
(Borough Electrical Engineer, Doncaster.)

The principal factor in bringing about the steadily increasing day load of an electricity station is the electric motor, and, as a consequence, the amount of information relating to it has increased considerably during the last few years, so that much useful and interesting data is now available. A large number of Papers and articles have been written on it bearing such titles as "The Prevention of Sparking," "The Advantages or Disadvantages of using Smooth or Slotted Core Armatures," "The Use of Bi-polar or Multi-polar Machines," and "Carbon *versus* Copper Brushes." The result is that electric motors are now much more efficient and mechanical machines than they were only a short time ago. For instance, the life of the motor of to-day is considerably longer than was that of the motor of the early days, and the cost of repairs and maintenance over a given time is of course proportionately less. It has been proved beyond dispute that the electric motor is a thoroughly mechanical, efficient and reliable piece of machinery, and capable of adaptation to nearly every class of work in which motive power is required. Several of our electricity committees, acting on the advice of their electrical engineers, have commenced to purchase motors, which they are hiring out to customers at fixed rentals. The amount of the rental naturally varies in different towns, but whatever it may be fixed at, it must of course cover maintenance, inspection and depreciation, over and above the amounts included for interest, &c. The present Paper is intended to deal with the question of motors when owned in large numbers by a corporation and let out on hire to consumers. The author would not have thought of submitting to the Municipal Electrical Association a Paper on this subject had it not been for the fact that he held the position of assistant electrical engineer to the Bradford Corporation, under Mr. A. H. Gibbings, when the hiring-out system of motors was adopted in 1896. The three years during which he was connected with the Bradford undertaking and responsible for the testing, fixing, and maintaining of a large number of motors, gave him somewhat exceptional opportunities for observing the working of motors ranging from ¼ B.H.P. to 12 B.H.P., and when working under many different conditions. A few notes on the motor-hiring department therefore, when viewed entirely from practical and working conditions as regards maintenance and upkeep, may be of some little interest to members of this Association, particularly at a time when many station engineers are seriously considering the question of adopting some system of letting motors out on hire. The

* Paper read before the Municipal Electrical Association, at Huddersfield, June 21.

Digitized by Google

anxiety as to the cost of maintenance of the motors on the part of many people would frequently seem to be groundless, the motor often being blamed when the blame might justly be placed elsewhere. As a matter of fact the motor itself seldom gives trouble of any description, provided it is chosen and fixed with due consideration to the nature of the work it is to perform, and that the starting arrangements are satisfactory. The starting switch is an item of vital importance, whose imperfections are often mistaken for the misdeeds of the motor. There are many manufacturers who turn out an excellent motor, but reliable starting switches are by no means so plenteous. Again, the few manufacturers who have a comparatively satisfactory motor-starting switch, standardise it, and make no other pattern or form, forgetting, it would seem, that if a corporation is to let out motors on hire satisfactorily, the motors must be capable of being used for all classes of work, and often it is absolutely imperative that not only the motor, but, what is as important from a maintenance point of view, the starter should be suitably designed for a given purpose. Probably there are many who will disagree with the opinion that standardisation in a department such as that now under discussion can be carried too far, but the author thinks that, of all things, starting switches are least capable of being standardised. A short reference to some of the cases with which the author has had to deal will go far to prove that a very considerable proportion of the maintenance charge is due not so much to the motor as to the apparatus and other causes external to it.

In the early days of the Bradford Corporation motor department shunt-wound machines were exclusively used, as it was then thought that this type of machine would best suit all requirements, and standardisation was considered desirable. Applications commenced to come in rapidly. At first it was found that the majority of motors were to be used for hoist and crane purposes, and hence it was frequently essential that they should be operated from any floor of the building in which they might be installed. Many of these buildings were six stories high. The motors in practically all these instances were fixed in the top flat or even in the roof. To ensure the starting of the machines from any floor a form of starter was employed, consisting essentially of two lead plates, falling by gravity into jars containing a dilute solution of sulphuric acid. The plates themselves were operated by means of a rope or chain carried to the entire height of the building. The speed of the plates when descending was regulated by means of a dash-pot, containing glycerine, the plunger having an adjustable valve. Primarily then the form of starter for all purposes was above the liquid form, and owing to the ease with which it lent itself to being operated from any floor, answered for some time admirably. One morning, however, the motor department staff was suddenly called out. A heavy frost the night before had so altered the density of the glycerine that the plates would not descend sufficiently to reach the short circuiting contacts, the speed of the motors falling considerably below what the consumers were accustomed to obtain, to say nothing of clouds of steam and acid spray, due to the rapid boiling away of the liquid. The dash-pot valves were then readjusted, and after a considerable time the whole of the complaints were remedied, and the motors were working again as merrily as ever. A few days later another similar call was made on the motor department. None of the motors would work! This time a sudden atmospheric change sent the thermometer several degrees above freezing point. The result was obvious—dash-pot valves wide open, lowered density of the glycerine, rapid short circuiting of the resistance, blowing of contractors' and Corporation main fuses, with the usual violent ringing of the telephone bell, and calls from enraged consumers. The rapid changes in temperature for some weeks caused very great trouble and expense, to say nothing of the annoyance to consumers, who promptly argued that electric motors were a failure. Experiments were next carried out with different oils in the dash-pots, and in many cases where there had been trouble with glycerine the substitution of oil cured it. Oil, however, had several drawbacks, the most troublesome of which was the unpleasant manner it had of dropping out of the dash-pot and generally causing a dirty, sticky mess on the working parts of the starters. The condition of affairs now arrived at was that in some cases the starters had glycerine dash-pots, while in other cases oil was used. The oil for some time gave little trouble. As the winter passed, the glycerine began to behave much more systematically, and curiously enough for many weeks little or no trouble was experienced from it, whilst the oil began to require greater attention. It may be incidentally mentioned before leaving liquid starters, that in no single instance was trouble experienced with the liquid in the jars freezing, and only a very small percentage of jars were broken, either in carriage, fixing or under ordinary conditions of use. Generally, however, it was decided that liquid dash-pots were not all that could be desired. The next step was the substitution of "air" dash-pots. These were not worked in conjunction with liquid for the resistance, as in deciding to abolish liquid in the dash-pots it was deemed advisable to endeavour to completely leave liquid of any kind out of the starter. This decision was come to on account of the evaporation of the water, the trouble experienced in keeping the liquid the right height and maintaining the conductivity constant. The new starters now took the form of a movable contact, falling by gravity along a series of contact studs, which in turn were connected to iron wire resistances. For some time the results obtained were most satisfactory, but a slight sparking on the contacts soon com menced to bring about worse troubles than ever, and in spite of many types of contacts being tried—among which were different forms of adjustable carbon contacts—the results were not entirely satisfactory. The author has not seen as yet a really reliable form of starting switch for working under the conditions given above, but when next he has occasion to use a starter for this class of work, he will feel much inclined to try the old liquid starter, with an air dash-pot, a combination as yet not attempted by him. With a more even temperature the starter difficulty lessened, and the next trouble to grapple with was the continual blowing o Corporation fuses, and all the attendant expenses. It will readily be seen that a very serious item of expense is introduced into the motor department if the inspectors are to spend half their time in climbing up and down the stairs of six storey buildings. The fuse trouble with crane motors for a time became very serious. The step first taken was to fix compounding coils on the existing shunt motors, the compound winding being arranged to assist the shunt coils. Four motors were first tried, and the number of visits of the motor inspector in the cases mentioned were greatly reduced. This was a most marked improvement, and the cost of maintenance of crane and hoist motors rapidly fell. In those cases where the load on the crane rarely varied and the motors were of such a size as to be well above their work, compound coils were not fixed, as no very serious trouble was experienced such as to warrant the extra expense in alterations to the motors. It is interesting to know that in spite of the somewhat severe conditions under which these motors were working in the early days, practically nothing was spent on the maintenance of the machines themselves, either in material or labour. In one or two isolated instances the commutators required attention, but nothing more than what emery cloth could put right, and such instances were distinctly attributable to the defective working of the starters. While the author has often heard the statement made that series motors give the best results for crane and hoist work, a well compounded machine, in his opinion, gives excellent results as far as a motor department is concerned, and the production of shunt motors, so arranged that compounding coils could be readily and easily attached, should they be required, might be worth consideration on the part of manufacturers. The size of motors used for hoist work was found to range generally from 4 B.H.P. to 6 B.H.P.

Leaving the question of hoist motors and starters, the next class of machines demanding attention was that in which the motors had a practically steady load throughtout the day. Cases of this kind were numerous, lines of shafting driving light machinery, such as sewing machines, small lathes, &c. Generally shunt wound motors were used except in one or two cases where compound machines were employed, the compounding opposing the shunt coils, when a particularly steady speed on a constant load was required. Many forms of starters were tried, the chief of which were the following: 1. Movement by means of worm and gear wheel, no automatic attachments of any kind being used. 2. Contact lever moving over contacts, and finally when all the resistance cut out, lever held in permanent position by small exciting coil, in series with the shunt coils of the motor. 3. Automatic overlaid attachment starters. Much has been said of late about the advantages to be gained by using overload automatic arrangements on motor starters. Taking our present example of a constant steady load, the following notes of experience obtained in Bradford with the three classes of starter named above, may not be uninteresting.

Using Starter Class 1.—It was found that only about 5 per cent. of the visits of the motor inspector were made on account of fuses having blown. Absolutely no trouble was experienced with the starter itself, as there is little doubt that a starter of this description can be made the simplest and most mechanical of all starters. The attention required was found to be less than in any other case.

Using Class 2.—It was found that 30 per cent. of the visits of the inspector were made on account of fuses having blown owing to too rapid operating of the switch, and another 20 per cent. on account of the exciting coils having either burnt out or being unable for various reasons to hold the contact lever in position. The latter defect often necessitated the complete removal of the starter and repairs to same. The commutator of the motor required considerable attention as compared with that necessary when using starter class 1, on account of the repeated heavy short circuits through the armature due to the fuses blowing.

Using Starter Class 3.—It was found that 6 per cent. of the visits of the motor inspector were made on account of fuses blowing, and another 15 per cent. owing to the automatic starters going wrong. Considerable attention was required to commutators. It will therefore be seen that where the motor has a steady constant load without repeated stops and starts being required, some form of starter which cannot be short-circuited too suddenly proves itself most efficient,

Digitized by Google

while overload and automatic starters have introduced troubles without effecting any advantage.

The third purpose for which motors have been largely used is the driving of circular saws, planing machines, mortar mills, and comparatively heavy machine tools, &c.—in fact, all those cases where a fluctuating load of short duration is required, but where such load may for short periods amount to an overload of considerable magnitude. Further, in these cases it is only necessary to start the motor from one fixed point. That the question of the starter has an important bearing on the cost of maintaining the motor in a working condition will be seen in the following instance. In a joiners' and builders' works were installed two 6 B.H.P. motors and one 10 B.H P. motor; the two 6 B.H.P. motors were used to drive a circular saw and a planing machine respectively, and the 10 B.H.P. motor a mortar mill. These motors were started by means of starters coming under Class 1. The result was most expensive. A fuse was blown nearly every other day. Estimating this to involve five hours per week on the part of the inspector, which is well below the actual time, and assuming the wages of the inspector to be at the rate of 8d. per hour, it gives an expenditure per week of 3s. 4d, and to this must be added sundry items such as fuses. It will be seen from this that if expenses of this character are going to be incurred in many cases, an appreciable sum will soon be run up against the motor department. The starters were now removed, overload starters substituted, and the weekly expenditure fell from the above 3s. 4d. to 3d. In nearly every instance the same result was obtained, and it is surely evident that, in the face of actual results, it is not the right policy to adopt one class of starter for all purposes, but to judge each case on its merits and instal the motor and starter of such a type as to best suit the conditions under which they will have to work. By all means let manufacturers standardise so long as they standardise more than one type of starter. Again referring to the starters under class 2, in which only an underload automatic device is used—in theory this is all very well, and should prove of the utmost use, but the author's experience with them, when used on the mains of a supply station, which does not every now and then shut down, is that they are somewhat of a nuisance, and in some cases where the field circuit is accidentally broken when the motor is running, it will often be found that the fuse will blow and the release on the starter will come back to its "off" position. The automatic *overload* starter in many cases is of the utmost value, and effects a very considerable saving to the motor department. The minimum automatic starter has proved to be more troublesome than otherwise if not combined with an overload arrangement. Before leaving the question of starters it may be mentioned that a great fault to be found in starters generally, and particularly in many of the later types of the automatic ones, is the very small margin allowed in the resistance wire. In many places it was found that long before the motor was running up to speed, the starter was acting more as an electric heating appliance than a starter, which, while useful in its way, is hardly the function for which the starter was installed. The starter of to-day is too electrical and not sufficiently mechanical.

Turning from the troubles caused by the motor starters we come to some of the principal difficulties that were experienced with the motors themselves apart from those caused to the motors by defective starting apparatus. Motors from ½ B.H.P. to 3 B.H.P. were found to give more trouble by some 30 per cent. than those ranging from 4 B.H.P. to 12 B H.P. By more trouble is meant that for every 100 visits of the inspector to the larger sizes some 130 would have to be made to the smaller; assuming each visit to take 1½ hours at 8d. per hour, we get £5 for the larger motors as against £6. 10s. 8d. for the smaller, the number of motors, of course, being equal in both cases. Looked at in another way there is an expenditure in the maintenance of the small motors of much greater magnitude per £100 of capital expenditure than in the larger motors. Motors geared to their work by means of spur gearing were found to cost in maintenance practically the same as when belted, there being only a difference of 3 per cent. or 4 per cent. in favour of the belted machine. Very few armatures of motors of 4 B.H.P. and upwards burnt out under ordinary working conditions. Exceptions, however, are taken to several cases where the faults have been due to defects in the design and manufacture, but as the whole of the expenses were in all these instances borne by the manufacturers, it would not be fair to include them in the maintenance of the motors. With small motors up to 3 B.H.P. over 100 per cent. more armatures were burnt out than was the case with the large machines, and in several instances the cost of rewinding had to be borne by the Corporation, as it was quite impossible to assign any reasons for the burn-outs other than those due to ordinary wear and tear and depreciation. The most exceptional case of armature burn-outs which came under the author's notice was that of the armature belonging to a 10 B.H.P. shunt-wound enclosed motor driving a line of shafting. In this instance eight armatures burnt out or rather broke down within 14 days. The cause was ultimately found out by the manufacturers, and it is only fair to add that it was largely due to circumstances over which they had practically no control. The whole of the large expense was defrayed by the manufacturers, who did their utmost throughout to investigate and remedy this remarkable instance of armature trouble. A large number of exactly similar machines had been working for weeks in other consumers' premises without giving any trouble whatever. Breaking down of field coils was a very rare event, but here again the small motors account for 150 per cent. more failures than the large ones. When the motor department was first commenced open type machines were used, and several shunt coils had to be replaced on account of external injury which in all cases except one were caused by the consumer and replaced at his expense. In two cases armatures of 6 B.H.P. motors were completely wrecked, (1) through a consumer letting a spanner fall on the revolving armature, and (2) owing to a box catching a brass armature guard and so throwing it out of position as to cause the sharp corner of the guard to catch the armature wires with the result that nearly every connection to the commutator was cut. Needless to say in both cases the consumer had to defray the expenses of repairs.

The above remarks show what an enormous advantage the enclosed motor has over the open type in view of the great risk there is of external injury to the latter. Apart from this point and the objections raised to the open machine by the fire insurance offices, there is much to be said in its favour. This opinion will doubtless be considered antiquated and out of date, but the cost of maintenance of these open type motors was found to be less than that of the enclosed, and for cool running they certainly are superior to the enclosed motors, many of which become merely cooking stoves after a four or five hours' run on full load. While fully believing the enclosed motor is the motor of the future, there are nevertheless features about the open type machine of a very desirable character, and which are not possessed by the enclosed type.

Commutators and sparking at the bushes were the causes of considerable expense, and in a number of instances armatures had to be removed and the commutators returned. Defective and inefficient brush gear was responsible for a large amount of trouble, augmented in some cases by vibration due to poor foundations, screws, nuts, &c., becoming loose and, consequently ineffective. The greater part of the expense incurred through attention required to commutators may be avoided, if suitable and efficient starters are available, and if the foundations are of a rigid and solid nature. The passing and inspection of motor foundations will be found to play a most important part in the maintenance account. Again and again has it been shown that any sort of foundation will not do for motors, and the importance of the foundations complying with the Corporation requirements cannot be over-estimated. In those cases where the Corporations lay the necessary foundations and charge consumers with the expense, the vibration difficulty disappears to a great extent, together with many of its attendant consequences. There are instances however where it is impossible to completely obviate vibration, whatever precautions are taken in laying the foundations. There was an instance, which once came under the author's notice, where a 12 B.H.P. motor was fixed in the top room of an exceptionally high building, the peculiar shape of the structure of which made it impossible to get a really solid foundation. Work, which required very exact setting out, was proceeding in the same room, and the vibration of the motor was likely to prove absolutely fatal to the adoption of this form of driving. The particular motor installed was of a design in which the armature shaft was a considerable height from the floor. A second motor was tried in which the bearings of the armature were much lower than in the first machine. The effect on the vibration was most marked, so much so that no inconvenience was experienced from it, and the adoption of electric driving has proved a wonderful advantage to this consumer.

Bearings running hot gave much less trouble than was to be expected, and again the small motors must stand the charge of causing considerably more trouble than the larger ones. As a rule the trouble could be traced to some definite cause, such as grit getting into the bearing, or the machine not being properly lined up to the driven pulley, or damage to the oiling arrangements. Other troubles at intervals would show themselves, such as terminal screws, &c, working slack. The clamping arrangements for holding the brush rocker in position on several occasions became loose, the result generally being the blowing of the fuse or the release of the overload attachment. Insulating bushes and washers would crack or sometimes soften from the heating of the motor, particularly the bushes, &c., used on the brush rockers in some types of machines. In one case a 10in. pulley bolted on to a flywheel worked loose on the shaft, but fortunately it was discovered in time to avert what might have been a serious accident. Generally it was found that very little trouble and expense was incurred in keeping the motors in thorough working condition, but it should be noted that all motors were thoroughly examined and tested at the station on delivery from the manufacturers and before sending out to be fixed on consumers' premises, and these examinations frequently revealed defects of a nature hardly to be expected in machines sent out by manufacturers of repute. Motors without terminal screws, terminal screws that

Digitized by Google

would not fit, sweating sockets missing, washers broken, portions of brush gear missing, &c. A practice was always made of carrying out an inspection, first for mechanical details, then electricity, and finally the motors and starters were tested for efficiency, heating, insulation, &c. It was no doubt largely due to this thorough overhauling at the supply station, that much trouble and annoyance was saved when the motors were finally fixed in consumers' premises.

It was the author's intention to include a table in these notes giving particulars as to the sizes, causes of defects when used for driving different classes of machinery, &c., of the motors he has had to deal with, but want of time has prevented him from getting this done. The foregoing remarks may, however, prove of some little use, if only in helping to show that when properly organised and worked, a Corporation motor hiring department is not a scheme which need cost excessive sums for its maintenance in thorough working order. The very great advantages of a motor load and the great success which met the Bradford Corporation's enterprise in this direction, managed by its late engineer, Mr. A. H. Gibbings, are now too well known to require any comment on the present occasion. The maintenance of the motors, it has been said, would prevent such a system ever becoming successful. If this Paper has done ever so little to dispel this idea and to show where some of the cost in maintenance is likely to be encountered, the author will feel amply rewarded.

The following is an abstract of the joint discussion on the above Paper and Mr. T. P. Wilmshurst's Paper on "Power Supply by Single-phase Motors." The latter will be found in our issue for June 6th :—

Mr. S. Z. DE FERRANTI (Hollinwood) said he thought that the subject of Mr. Wilmshurst's Paper was a matter of the very greatest importance to a large proportion of central station engineers, and a matter of vital importance to ratepayers owning alternating-current stations all over the country. It was felt that the alternating-current supplies were handicapped from the commercial point of view very much in relation to the continuous-current supplies. This was due, as Mr. Wilmshurst had pointed out, to certain defects in the system ; one of these defects was the question of motors, but he thought this would be more easily solved than that of arc lighting. The statement that alternating current was less economical in working than direct was generally believed, but, of course, it was not really so. The trouble with arc lighting was perhaps the most difficult one, but when one saw how generally enclosed arc lamps were coming into use, and when the figures of the working of these were taken, one had to go but a little bit further with the incandescent lamps in order to show that there was little in the ordinary arc lighting of shops and private premises from the commercial point of view. The efficiency of these enclosed lamps according to many tests which had been made was exceedingly low, and good incandescent lamps ran them very close. With regard to the public lighting of the streets he did not think there was any disadvantage in the alternating-current system because it could be specially dealt with, and even when one had continuous current there were disadvantages against the use of continuous current for lighting a circuit of four or eight lamps fed from different parts of the low-tension mains. Many people thought that for motive power the single-phase alternating current was played out, and that they would have to change either to continuous current (which certainly had great advantages for certain purposes) or to put down a multiphase system in place of the single phase. He had gone into the matter very carefully, and could not see any reason for putting down a multiphase system. To change the system of distribution to a two-phase system was very costly, and would not give any commensurate advantage for the expenditure involved, nor would it give a system which would be as satisfactory to work as the plain single-phase supply. There were distinct advantages in changing from single-phase to continuous current, but the advantage of multiphase over single phase did not warrant change. There was some information given in the Paper, however, which showed the good starting capacity and the very good efficiency of single-phase alternating-current motors. He had been struck with several of the installations where these motors had been employed. He had noticed a little while ago at Paisley a single-phase motor used for driving a centrifugal pump for condensing work at the station. Nothing could be better than the perfect ease of starting, the way it ran up to speed, and the way it dealt with the pumps. The motor was a beautiful piece of mechanical construction, and its operation was quite perfect. There were many motors coming on to the market which had good efficiencies, and it struck one that these were better than the continuous-current motor with its commutator, &c. There was no doubt about the advantage of distributing over a large area with the single-phase system, but it was handicapped in a few points which had yet to be solved. It remained with them to form an idea how soon these disadvantages would be got over. He had been using a condenser in connection with a single-phase motor, and when this could be put on the market at a fairly low price, then the alternating single-phase system, so far as motive power was concerned, would have accomplished the last step necessary to put in on an equality with continuous current, and the single-phase motor will really then be able to accomplish with high efficiency and good power factor all that one could wish. The advantages of a plain single-phase supply are so great and so undisputed that he was sure it was worth everyone's while to remove the objections rather than say the system is bad and should be replaced by something else.

Mr. S. E. FEDDEN (Sheffield) said the problem before them in Sheffield was, how they should supply their consumers with power, and he hoped this was solved by Mr. Wilmshurst's Paper, as he stated that with single-phase motors they could run lifts and do almost anything they required. He did not agree with Mr. Wilmshurst, however, that enclosed alternating lamps were as good as continuous-current lamps. He thought single-phase current should be run through rectifiers for arc lamps. In Sheffield they had one consumer who had a very large number of lights and motors, and he had requested them to supply him with continuous current, so they had fixed a motor generator for this purpose. This motor ran very well after it had got into synchronism ; but it took some time to do this. He was anxious to learn all he possibly could respecting the single-phase motor, as if he had to instal continuous current plant it would mean an enormous amount of capital expenditure.

Mr. W. A. CHAMEN (Glasgow) said he was very pleased to hear of the prospects which the alternating single-phase works had before them, but he was glad he had not the problems connected with this system to deal with himself just now. He thought Mr. Prussman's Paper was a most valuable one to those who were considering the question of hiring out motors. He believed that the liquid switches referred to had been superseded by resistance coils and more economical kinds of apparatus.

Mr. W. LANGDON DAVIES (London) said he could thoroughly endorse the difficulties which have had to be endured by those who had tried to instal single-phase motors on their circuits. The trouble, however, in many cases arose through the circuits not being sufficiently large, as they had been laid simply for lighting, and no allowance had been made for motive power. Unless the motor could be provided with some kind of storage it was impossible to get the power factor above a certain point, and therefore they were bound to have a certain amount of wattless current. There were in England some 15 different periodicities, varying from 40 to 100 ∽ per second, and a motor to be designed to its very best should be designed for the periodicity of the mains upon which it is to be run. It was impossible to keep stocks of motors for all the different periodicities, and it sometimes happened that the motor supplied was not at all suitable for the periodicity of the particular mains.

Mr. R. C. QUIN (Blackpool) had had experience with both single phase and continuous current. In comparing the two systems he thought the palm for elasticity and general purposes, apart from power, must be given to single-phase alternating current. New life had been given to continuous systems by the increase of voltage. Mr. Ferranti had told them of a two-phase motor to be applied to the single-phase motor, which he (Mr. Quin) had no doubt would be accomplished before long. In Blackpool they ran their machines in parallel, but the result was that the wave form of their curve varied minute by minute, and consequently single-phase motors were not a success with them.

Mr. W. B. ESSON (Johnson & Phillips) said the difficulties encountered in using the single-phase motors in the past were largely due to the engineer not specifying that the generating plant was required for power. Some of the generators at many stations had a drop of 20 to 30 per cent., and under these circumstances it would be difficult to suppose that with these alternating motors would run satisfactory. What was required, of course, was to raise the power factor. From the engineer's point of view the motor with a power factor of 90 per cent. and an efficiency of 80 per cent. is a better machine than with a power factor of 80 per cent. and an efficiency of 90 per cent. With reference to multiphase supply he disagreed entirely with Mr. Ferranti. To convert a single-phase machine into a two-phase machine was a very simple matter, and the extra cost would only be about 5 per cent. The advantages he considered were great as the system was absolutely flexible. With the two-phase system he considered it was a very simple matter to supply either alternating or continuous current. It was a great consolation to him to know that some kind of a condenser was commercially possible. He was sure, however, that the single-phase motor plus the condenser was no comparison whatever with the multiphase motor with regard to the risk of breakdown.

Mr. H. FARADAY PROCTOR (Bristol) asked Mr. Ferranti what would be the relative advantages of high and low periodicities in conjunction with condensers ?

Mr. S. Z. DE FERRANTI said that he did not see any chance for high periodicities so long as it was left high periodicity. He thought they should have the high periodicity reduced to low, and he was glad to say that he did not think it would be as expensive a matter as at first thought.

Mr. A. S. BARNARD (Hull) asked Mr. Quin if he took the 500-volt current straight from his trolley wire into a private house ?

Mr. R. C. QUIN replied that there was no law by which they were not allowed to take high pressure into a house.

Ald. WOODHEAD (Halifax), Councillor J. P. SMITH (Barrow-in-Furness) and Mr. C. S. VESEY BROWN (Lincoln) also spoke.

Mr. T. P. WILMSHURST (Derby), replying, said that Mr. Esson overlooked the point of view of the station engineer, who may possibly have to scrap £50,000 worth of plant. The single-phase motor may not be the best motor on the market, but it was not sufficiently inferior to the continuous or two-phase to warrant any change. He would rather have the alternating single-phase or two-phase motor than the continuous. He thought, on reading Mr. Prussman's Paper, it was a confession of failure all the way through for continuous motors, and he felt he was glad that he was not a continuous-current engineer. With reference to arc lighting he had both alternating and continuous lamps at Derby, and he preferred the alternating lamp from the point of view of trouble and the light which the lamp gives.

Mr. C. A. L. PRUSSMAN (Doncaster), in reply, said that, regarding starting switches, he considered it was better to make a variety of switches, more particularly than to trouble about the question of cost. In some cases an overload switch was necessary. He thought there was a danger in the manufacturers quoting their motors and switches in one price as there would be a danger of having to take one particular type of starter always. He thought if Mr. Wilmshurst compared the number of motors on alternating-current mains with those on continuous mains then the percentage amount of trouble would be in favour of the continuous current.

The Electrician.

The Oldest Electrical Journal (established as a weekly Journal 1861—1878

Published every Friday, Price Sixpence; Post Free, Sixpence-Halfpenny.
Editorial Publishing and Printing Offices,

1, 2 & 3, SALISBURY COURT, FLEET ST., LONDON.

Telephone: 949 Holborn. *Telegrams:* "Electrician Newspaper London."

All Letters relating to Subscriptions, Advertisements, and other business matters should be addressed to the Publisher "The Electrician," *Salisbury-court, Fleet-street, London, E.C. Cheques and Money Orders should be made payable to* "The Electrician" *Printing and Publishing Company, Limited, and be crossed "Coutts and Co."*

All Editorial letters to be addressed to The Editor.

All letters for insertion in "The Electrician," *or containing questions, must be accompanied by the name and address of the writer as evidence of good faith. No notice whatever is taken of anonymous communications.*

"The Electrician" *is published every Friday morning, in time for the morning mails. It is on sale at the railway bookstalls throughout the Kingdom on Friday morning, and can be obtained of all Booksellers and Newsvendors; or direct from the Publishing Offices, as above*

Subscription Rates.—The Rates for Subscriptions to "The Electrician" are as under:—

	Year	Half-Year	Quarter	
United Kingdom	26s. 0d.	12s. 6d.	7s. 0d.	Post free, payable in advance.
Postal Union	30s. 0d.	16s. 0d.	8s. 0d.	

New Volumes of "The Electrician" *commence in April and October.*

"The Electrician" *offers exceptional advantages to Advertisers.* **It has by far the largest circulation of any English Electrical paper, and circulates all over the World.** *This statement is guaranteed.*

Advertisement Rates, &c., forwarded on application to the Publisher.

Trade Advertisements *intended for the current issue must reach the Office not later than First Post on Thursday. Renewals of expiring advertisement orders and alterations to standing advertisements must be in Publisher's hands by Wednesday. Wrapper Advertisements by Wednesday morning.*

Official Announcements, Auctions, *and* Small Advertisements *accepted up to 6 p.m. on Thursday.*

ELECTRICAL BOOKS AND PUBLICATIONS.

All Books, Newspapers, and other publications can be ordered direct of The Electrician" *Printing and Publishing Company, Limited. The well-known* "Electrician" Series *of Standard Electrical Works at present consists of—*

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. Elton Young, M.I.E.E. Price 10s. 6d., post free; abroad 11s.

THE STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By Messrs. H. K. C. Fisher and J. C. H. Darby. Price 6s. net; abroad, 6s. 3d.

BIBLIOGRAPHY OF X-RAY LITERATURE AND RESEARCH. Edited by C. E. S. Phillips. With an introduction on the history of Crookes Tube and Röntgen Ray work, and a chapter giving "Practical Hints" on the subject.

THE POTENTIOMETER AND ITS ADJUNCTS. By W. C. Fisher. Price 6s., post free.

LOCALISATION OF FAULTS IN ELECTRIC LIGHT MAINS. By F. C. Raphael. Price 5s., post free.

MOTIVE POWER AND GEARING. By E. Trembley Carter. Price 12s. 6d., post free.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. Wilkinson. Price 12s. 6d., post free.

ELECTRICAL LABORATORY NOTES AND FORMS (Elementary and Advanced). Arranged by Dr. J. A. Fleming, M.A., F.R.S. Printed particulars on application.

ELECTROMAGNETIC THEORY. By Oliver Heaviside. Vol. I. Price 12s. 6d., post free 13s. Vol. II. Price 12s. 6d.; post free, 13s.

THE ALTERNATE CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Dr. J. A. Fleming. VOL. I.—THE INDUCTION OF ELECTRIC CURRENTS. New Edition. Price 12s. 6d., post free. VOL. II.—THE UTILISATION OF INDUCED CURRENTS. Price 12s. 6d., post free.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. Fleming, M.A., D.Sc., F.R.S. New Edition. 93 original illustrations, price 6s.

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. Ewing, M.A. New edition. Price 10s. 6d., post free; abroad 11s.

ELECTRIC MOTIVE POWER. By A. T. Snell. 10s. 6d. post free.

THE ART OF ELECTROLYTIC SEPARATION OF METALS (Theoretical and Practical). By Dr. George Gore. Price 10s. 6d., post free.

ELECTRO-CHEMISTRY. By Dr. George Gore. Price 2s., post free.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. Kennelly and H. D. Wilkinson. Price 6s. 6d., post free.

DRUM ARMATURES AND COMMUTATORS (Theory and Practice). By F. M. Weymouth. Price 7s. 6d. post free.

THE INCANDESCENT LAMP AND ITS MANUFACTURE. By Gilbert S. Ram. Price 7s. 6d., post free.

A POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. Gempel and H. M. Kilgour. Price 7s. 6d. net, post free 7s. 9d., abroad 8s.; large-paper edition, 12s. 6d., post free. New edition in the press.

"THE ELECTRICIAN" PRIMERS. In Two Vols. Paper covers, 2s., post free 2s. 2d. each; strong cloth 2s. 6d., post free 2s. 9d. each. Single Primers 2d., post free 2½d.

WIRELESS TELEGRAPHY: Signalling across Space without Wires by Electric Waves. By Dr. O. J. Lodge. New Edition. Price 5s. net.

A DIGEST OF THE LAW OF ELECTRIC LIGHTING, ELECTRIC TRACTION, TELEGRAPHS, TELEPHONES, &c. A. C. Curtis-Hayward, B.A. To January, 1900. Price 3s. 6d., post free.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By Francis Jehl. Price 10s. 6d., post free.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. A Practical Guide to the Establishment of a Carbon Manufactory. Price 1s. 6d., post free.

THE STEAM ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. Beaumont. Price 3s. 6d., post free.

FULL CATALOGUE POST FREE ON APPLICATION.

"ELECTRICIAN" SERIES FORTHCOMING BOOKS.

THE ELECTRIC ARC.—By Mrs. Ayrton. This work is in the press, and will contain an historical sketch of the early experiments on the electric arc, as well as the important results of recent research.

PRIMARY BATTERIES.—A work on this subject will shortly be published bringing the theory and practice of the Primary Battery up to date. The book will be fully illustrated.

SECONDARY BATTERIES.—By E. J. Wade. Fully illustrated. The Author in this work will deal briefly with the theory and fully with the chemistry, design, construction and manufacture of secondary batteries or accumulators.

SPECIAL NOTICES.

NOW READY.—Vol. XLIV. of "The Electrician" (960 pages), bound in strong cloth. Price 17s. 6d., post free 18s. 6d. Also ready, Cases for binding. Price 2s., by post 2s. 3d.

A complete set of "The Electrician" (1878-1900) can now be supplied. These sets are very scarce, and early application should be made.

NOW READY.—"THE ELECTRICIAN" READING CASE. Holds four copies of the Journal. Strongly made and corded for hanging. Price 1s.; post free, 1s. 4d.

RIVAL SYSTEMS OF ELECTRIC POWER.

The impetus which has been given of late to the development of electricity for motive power purposes in this country has apparently divided the electrical profession into no less than four rival camps, each prepared to defend its chosen motor system against the onslaughts of the other three. The battle of the motor systems has been called a duel, because of the rivalry between continuous and alternate-current systems; and it has also been called a triangular duel, because alternate-current men are divided into single-phase and polyphase advocates. But, as a matter of fact, it is a four-sided duel, if duel it be at all, for the polyphase men dispute among themselves the relative merits of two-phase and three-phase systems, a dispute which involves not merely a matter of detail but essential differences in the design. We are speaking now of motors, and motors only; it is on the question of the type of motor to be recommended to consumers that this four-cornered fight is taking place. Were we to consider, not merely the motor, but the entire system of generation, transmission, distribution, and motor working, we should discover curious compacts and tacit understandings between the various foemen. For instance, some are on the polyphase side when it is a question of generation and transmission, but transfer their allegiance to the continuous-current camp when the motor question arises. Others are consistently and staunchly polyphase right through; while others are equally consistent in their allegiance to other simple systems. The permutations and combinations of the four ordinary arrangements promise, therefore, to provide an almost endless variety of practice in the immediate future, and to afford ample opportunity to consulting engineers to display ever varying ingenuity before their distracted clients. What the best interests of the profession call for, however, is not such a condition of things as this, but rather that engineers should ascertain with as little delay as possible what is really the best system for any given set of conditions. Simplicity, uniformity and standardisation in practice are *desiderata* to be aimed at by consulting engineers who may design electricity works in future, rather than an ambitious display of originality—troublesome to the contractors, costly to the clients, and exasperatingly disappointing to posterity.

Returning to the question of motors, it is worthy of note that certain prominent engineers are the undoubted believers in the universal applicability of the system each one may champion; whereas others are only the advocates of a given system because it seems best to suit an already existing condition of things. Mr. Ferranti, for example, is the

Digitized by Google

undoubted champion of the single phase motor; Mr. Esson is not less valorously the champion of the two-phase motor; Mr. Chamen is the staunch advocate of continuous currents; whereas, on the other hand, Mr. Wilmshurst, the municipal electrical engineer at Derby, is an advocate of the single-phase motor only, because to introduce it into Derby is less costly than to convert the existing single-phase system of distribution into a polyphase or continuous-current system. This aspect of the matter is presented in his Paper on "Power Supply by Single-phase Motors," read by Mr. Wilmshurst at the recent convention of the Municipal Electrical Association. The conditions of supply at Derby, however, are specially favourable to the use of single-phase motors, as compared with other alternate-current works in this country; for there is a lower frequency there than in any other system, the frequency being only 40~. Even Mr. Ferranti had to admit, in the discussion which took place on this Paper, that single-phase motor working is hopeless where the frequency is high. Mr. Faraday Proctor, who extracted this confession, probably had his own system at Bristol in his mind, and must have felt justified in laying down continuous-current plant for the power supply of that city. Everyone will agree that a satisfactory electrostatic condenser would place the single-phase motor in a much more advantageous position than it is at present. But the admission does not do the single-phase motor much good, since no satisfactory condenser is to be found on the market. Mr. Ferranti's assurance that he possesses—indeed, has owned and worked for over four years—a condenser possessing all the requirements of durability, &c., is encouraging to engineers who, as controllers of existing single phase plants, can see no way of converting to a system better adapted to power supply; but we question whether it will cause one moment's hesitation to those who contemplate laying down polyphase plant. To the single-phase motor a condenser is almost a necessity of existence; but the condenser, even when perfected, will fall far short of raising the single-phase motor to the rank of the ordinary polyphase motor. The single-phase motor is doing good work, in a restricted way; factories are being driven by it, and it has shown itself useful in a variety of cases where other electric power could not be obtained. But it has not the elasticity and ease of the polyphase system. In fact, where motor power work alone is to be carried out, or wherever the load is chiefly due to motors, experience, we think, has already abundantly shown that the polyphase systems are superior to any other; but where the load is largely due to electric lighting, practice, we believe, will for some time to come be divided between polyphase and continuous-current systems, or will consist in a combination of the two.

REVIEWS.

(Copies of any of the undermentioned works can be had from *The Electrician* office post free, on receipt of published price.)

Æther and Matter. By Joseph Larmor. (Cambridge University Press, 1900.)

All Nature, so far as physical investigation extends, consists of æther (why need one be bothered with that inconvenient diphthong? ether is much easier to write) and matter, and consequently Mr. Larmor's treatise naturally touches on an immense variety of fields. The basis of our theories of light, electricity and magnetism, chemical action, electrolysis, aberration, the Zeeman effect, are all touched on, together with a discussion on the Scope of Mechanical Explanation, and on the Idea of Force. It will thus be seen that it deals with questions which lie at the basis of our whole conception of the physical universe, and of our methods of explaining its phenomena. It would require more space than could reasonably be accorded to a review, and more time than the readers of *The Electrician* would mostly care to devote to the subject, to discuss in a way that could be followed the questions raised by Helmholtz, Hertz, and Larmor as to the sufficiency of the principle of least action as a basis of our mathematical analysis of physical phenomena, but the readers of *The Electrician* may naturally feel an interest in many of the questions dealt with in this important work.

In dealing with the phenomena of electromagnetism we may consider ether and matter as all one medium with different properties in its different parts, some parts being insulating and some conducting, some having one permeability and some another. In such a treatment it is not necessary to look for an explanation of these properties, and such a treatment covers a large number, indeed a *very* large number, of the phenomena. It is the method employed in our ordinary treatise on electromagnetism, and is quite sufficient for most purposes. But just as dealing with light as propagated in rays is a most useful method in optics, but breaks down when we study the subject more profoundly, so we are driven by many electro-chemical phenomena, by the electric discharges in vacuum tubes, and by a number of other phenomena in which the relation of molecules and atoms of matter to the ether is involved, to form some more definite hypothesis as to the connection of ether and matter than the simple one that we are dealing with—a single continuous medium with different properties in different parts. Ever since Faraday discovered the law of electrolysis, that to the rupture of each chemical bond there corresponded the transference of the same quantity of electricity, no matter what the kind of bond might be, it has been in the scientific air that electricity as well as matter may be atomic. Maxwell, in this connection, was driven to use the term atom of electricity, although he deprecated it as quite contrary to the whole spirit of his treatise, but it is now recognised largely, thanks to Mr. Larmor and to Prof. Lorentz, of Leyden, that so far from this idea being contrary to the spirit of Maxwell's treatise it is in reality quite compatible with it, and from some points of view even essential. Mr. Larmor's book is mostly concerned with an elaboration of this view of the nature of electricity. He supposes that these atoms of electricity, or electrons, as Mr. Stoney called them, produce the phenomena of electric currents by their motion, and either move from molecule to molecule of matter, as in ordinary metallic conduction, or along with the atoms of matter, as in electrolytic conduction. To suppose that an electric current consists of opposite streams of positive and negative separate electrons instead of a continuous process taking place at all parts of a conducting wire necessitates a rather complicated study of the equations that are ordinarily used; and this is one of the matters that Mr. Larmor devotes attention to, with the result that he finds that all the ordinary equations are applicable to the theory he is investigating, to the degree of accuracy attainable by our existing methods of studying the phenomena. It seems, however, pretty certain that if an electric current consists in the motion of separate electrons it cannot be *exactly* equivalent to a current uniformly distributed over the conductor. The self-induction of a current that runs in a set of separate wires is somewhat greater than that of a current uniformly distributed over the same area as that occupied by the wires, and one would consequently expect a small difference between the calculated and observed self-inductions of a coil, if this electron hypothesis be true. Hertz looked for but failed to detect anything of this kind. The effect to be expected is so very small that even he may very well have been unable to find it with the appliances at his disposal.

Mr. Larmor's fundamental treatment of the subject enables him to discuss effectively the changes in electric and magnetic phenomena that may be expected to arise owing to the motion of matter through the ether. In one of the appendices he enters into a discussion as to how this is possible when the ether is a medium that transmits transverse vibrations. The only other media we are familiar with that transmit transverse vibrations are solids, through which we cannot in general move without resistance. He shows conclusively that the suggested expla-

Digitized by Google

nation of Sir George Stokes that the ether is like a very soft solid is untenable on account of the existence of aberration, and the absence of any evidence of slipping of the earth through the ether with the consequent irregular distribution of relative velocity over its surface. His theory practically assumes that matter can move through the ether much in the way that a drop of liquid water can move through a lump of ice, namely, by melting in front and freezing up again behind. Upon this class of theory matter and electrons are centres of some peculiar strain in the ether, and when they move it is this strain that moves like a wave through the ether, whether with a central core like the core of a vortex ring, or without one is not finally decided. The general conclusion at which Mr. Larmor arrives is that no terrestrial experiments yet devised can decide whether the ether is or is not stagnant near the earth, because the phenomena would be exactly the same so far as our existing means of observation are concerned, whether the observer and all his surroundings were standing still relatively to the ether, or were moving with such velocities as 20 miles a second, which is comparable with that of the earth in its orbit, and is the greatest at our disposal. In order to reconcile this with the result of Michelson and Morley's classical experiment he has to assume that the length of a body depends on whether it is moving lengthwise or sideways through the ether. To justify this he shows that, if the laws connecting the forces between material atoms vary with motion through the ether in the same sort of way as those between electric charges do, then just the required change of length that experiment demands would occur. This seems to make it practically certain that Michelson and Morley's experiment is really a very accurate measurement of the change of length of a body as it moves in different directions through the ether. As this theory would require that a diameter of the earth should only change by about 10cm. as it moves in different directions through the ether, the extraordinary delicacy of Michelson and Morley's experiment is made evident. It is to be regretted that no effect other than aberration and the change of frequency of light waves, due to the relative motion of the earth and the ether, can be detected; for, if any considerable change in electromagnetic forces due to this cause existed, there might be some hope of our being able to utilise this relative motion to drive engines, and thus obtain a source of power practically unlimited in amount, and confined to no one part of the earth.

The book consists of 15 chapters and six appendices. The 15 chapters are substantially the same as the work to which an Adams prize was awarded to Mr. Larmor in 1898, and contain, in addition to the subjects already referred to, discussions as to the effect of the motion of the medium on the transmission of light through it, as to the nature of Röntgen radiations, and as to the pressure that light exerts on bodies that reflect or absorb it. The appendices contain an admirable summary of the relation of electrolytic conductivity to ionic theory and electric osmosis, and a short account of the theory that explains thermo-electricity by the motion of electrons. In Appendix E. Mr. Larmor develops a theory as to the intrinsic nature of an electron that is most interesting and suggestive, even if not in every respect unassailable. Advance, however, would be impossible if every hypothesis were relegated to the lumber heap that appeared open to serious objections. The wave theory of light was long discarded on account of the difficulty felt in reconciling it with the rectilinear propagation and the polarisation of light, and even yet some difficulty attaches to it on account of the free motion of matter through a medium that transmits transverse waves. Yet the difficulty does not, fortunately, prevent our accepting the wave theory of light as even more than a working hypothesis. Mr. Larmor does not claim more than this for his suggestion as to the nature of an electron.

The last appendix contains an account of most of what is known as to the theory of the Zeeman effect and its connection with Faraday's discovery of the effect of the magnetisation of a medium in rotating the plane of polarisation of light.

In all its parts the work is most interesting and suggestive, though in many places so condensed and general in its language as to be very difficult to follow. It marks a distinct advance in the scientific treatment of electromagnetic phenomena and important developments of our knowledge of the connection between matter and ether.

GEO. FRAS. FITZGERALD.

Die Einrichtungen zur Erzeugung der Röntgenstrahlen, und ihr Gebrauch. By Dr. B. DONATH. (Berlin: Reuther and Reichard, 1899.) 4.50M.

There is a large amount of information to be found in this book: sound information of a practical sort, and—mostly German. Indeed, if the work had for its object alone the advertisement of German apparatus, it might be said to have fulfilled its purpose exactly, for, in discussing the merits of the various coils, vacuum bulbs, and so forth, there appears to have been a deliberate effort to avoid adequate reference to the work of other nationalities.

The first few pages deal mainly with elementary ideas relating to the action and function of primary batteries and their connections, while at the end of this first chaper we are introduced to a summary of the matters referred to therein. The plan appears to be useful: it is certainly thorough, and being adopted throughout the book, forms, with the table of contents and index, a ready means of rapidly co-ordinating a reference. The practical aspect of the work begins to appear in Chapter II., where the details of both primary and secondary battery design are discussed and illustrated. On page 28 the first word is spoken as to electrical induction, and descriptions of various induction coils follow naturally. But one might not expect to find, outside an instrument maker's catalogue, such a profusion of illustrations and references to contact-breakers or current interrupters as is given in the fourth chapter of this book. We found there descriptions of between 20 and 30 slightly different interrupters, accompanied by as many well-executed drawings of the instruments. The majority of these devices make use of mercury in some manner or other, and many of them are ingenious. The electrolytic interrupter is given considerable prominence. We do not know of any other work on this subject that gives such a complete account of methods of interrupting the primary current of induction coils.

The more subtle properties of the vacuum bulb are next described, and a rapid survey taken of the progress of researches relating to the matter, but the illustration on p. 77 of a Röntgen lamp in action is unsatisfactory. It is well known now that at low pressures the cathode stream emanates almost entirely from the central part of the hollow negative electrode. The question of regulating devices for varying the gas pressure within exhausted bulbs is briefly discussed, and in Chapter VI. we again find numerous illustrations and references to apparatus for use with the induction coil and Röntgen lamp. Resistances, ammeters, and stands for holding the exhausted bulbs are there fully described. The actual process of taking a radiograph is not omitted, while considerable space is devoted to purely photographic details. It is surprising, however, to find no reference to Mr. Mackenzie Davidson's work in connection with the localisation of foreign bodies embedded in the tissues, for he has done more than anyone else to place this matter upon a practical basis.

In the last 20 pages of the book Dr. Donath gives an account of researches undertaken by numerous physicists to ascertain the "nature of Röntgen rays," and this concluding chapter has been excellently done. The various well-known theories are there set out with clearness, and their merits discussed without allowing this portion of the work to overshadow the rest of the book. There is a good sense of proportion evident throughout the whole compilation, and we commend it to all who have an interest in the fascinating study of this branch of electrical physics.

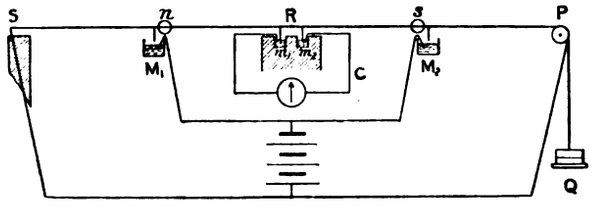
CONTEMPORARY ELECTRICAL SCIENCE.

[Compiled by E. E. Fournier d'Albe.]

Anomalous Electromagnetic Dispersion.—As in optics, so in the domain of electromagnetic radiation, the angle of refraction varies with the incident wave-length. In some chemical substances the dispersion does not vary continuously with the wave-length, but changes abruptly at certain points, and then we have anomalous dispersion, as in the solutions of certain copper and chromium salts, and, according to Kundt, in iron, nickel and cobalt. Recent researches have shown that these anomalies are invariably found in the neighbourhood of absorption bands, and the experiment of Macaluso and Corbino, first supposed to indicate an inverse Zeeman effect, has since been connected with the anomalous dispersion of sodium vapour in the neighbourhoud of the D lines. A. Schmauss has made some measurements of the electromagnetic rotatory dispersion in the fuchsine solutions and in didymium glass which justify the general conclusion that optical anomaly in dispersion is invariably associated with electromagnetic anomaly. In strongly absorbing media the anomaly extends for a considerable distance on both sides of the absorption band, and it increases with the concentration and with the narrowness and sharpness of the absorption band.

[A. Schmauss, *Ann. der Physik*, No. 6, 1900.]

A String Alternator.—K. Honda and S. Shimizu have invented a simple contrivance for converting a continuous into an alternating current whose frequency may be readily varied within wide limits. It is a modifiation of Pupin's interrupter, and its construction is evident from the diagram. A copper or aluminium wire is stretched horizontally, one of



the ends being fixed to a stout support S, while the other, passing over a small metallic pulley, P, is attached to a weight, Q. The wire is electrically discontinuous at the middle point R, so that the current is diverted into the circuit C, with which contact is established through the mercury cups $m_1 m_2$. Two further mercury cups at $M_1 M_2$ serve as alternative terminals for the battery current. The vibration of the string, once established, is maintained by the magnets n and s, which may be electromagnets or permanent ones. The wire has a single node in the centre, and the circuit c is the circuit in which the desired alternating current is produced. The Japanese physicists add that they have produced rates varying from 30 to 1,000 per sec. The inductance of the circuit must be kept small.

[Honda and Shimizu, *Am. J. Science*, July, 1900.]

Magnetic Rotatory Polarisation in Liquefied Gases.—The continuity of the optical properties of substances under different circumstances as to pressure and temperature, especially during changes in the state of aggregation, is an important point of investigation on which light can be thrown by measurements of the Faraday effect. The molecular rotatory constant will generally depend on pressure and temperature and will vary considerably with the state of aggregation. Becquerel made some measurements in which he found that during the transition from the liquid to the gaseous state the magnetic rotation of carbon bisulphide decreases much more rapidly than the density. This would indicate that the Faraday effect is practically confined to liquids. L. H. Siertsema has begun a series of experiments with a number of liquefied gases which promise some interesting results. Many difficulties have to be surmounted, such as the formation of bubbles owing to a slight conduction of heat. This necessitates additional protecting glasses, and consequently larger rotations to compensate the increased inaccuracy. The author uses the Aron's mercury arc lamp, and begins with methyl chloride at −28deg. Preliminary measurements show that the dispersion, at all events, is of the same order as that found in the gaseous state.

[L. H. Siertsema, *Proc. Roy. Acad., Amsterdam*, May 26, 1900.]

Spark-Length of an Induction Coil.—R. Beattie has studied the effect on the secondary spark-length of using different materials for the primary poles, and of varying the rate of break and the E.M.F. in the primary circuit. In place of the usual vibrating interrupter a special contact-breaker was employed, by means of which the primary poles could be separated either slowly or quickly, as desired. As regards the material of the poles, platinum gives a much longer spark than either lead or carbon. This is no doubt due to the fact that carbon is more easily disintegrated, and sets up an arc which bridges the gap. A quick break gives a long spark, and a slow break a short spark. As a rule, a high E.M.F., by prolonging the arc, gives a shorter spark in the secondary. But this is not the case with carbon, zinc and lead poles and a slow break. The "best capacity" for increasing the length of spark also depends upon the rate of break, decreasing as the break is quickened. In the case of zinc, however, it increases, and for certain capacities a quick break may actually give a shorter spark than a slow break. This peculiar behaviour of zinc when used as a break-pole is probably connected in some way with its non-arcing properties.

[R. Beattie, *Phil. Mag.*, July, 1900.]

Thermo-Electricity of Nickel Steel.—The announcement of the high thermo-electric force of nickel steel containing 28 per cent. of nickel having given rise to some doubts, C. E. Guillaume forwarded an authentic sample of such steel to E. Steinmann for re-determination. The latter announces now that the phenomenally high value of −2,461 microvolts with reference to lead is not shown by the authentic specimen, which only shows 385 microvolts. The old specimen turns out to have been wrongly labelled. It should have been marked as containing 36·1 per cent. of nickel.

[E. Steinmann, *Comptes Rendus*, July 2, 1900.]

ELECTRICITY WORKS ACCOUNTS.

Croydon Municipal Electric Supply Works.

The accounts of this undertaking present once again most satisfactory figures. In our remarks on the 1898-9 accounts we were able to note the excellent position which the concern had attained even then only in the second year of working. Last year's results, summarised in our table this week, indicate a material advance in all essential respects. Examining the figures representing the generating costs it will be noticed that with the exception of the fuel item all the charges, though some have increased, are much below the normal even under the improved conditions of output and load-factor. The fuel item is true to the prevailing tendency to high costs in this department. We learn from the Corporation's electrical engineer that the consumption of coal during the year was no more than 5·87lb. per unit generated. In view of this, the figure of 0·97d. per unit points to an exceedingly high price of coal at Croydon. The wages at the station have fallen very materially from what was already a very low figure. The slight increase in the works costs has been more than compensated by a diminution in the management charges, with the result that the aggregate costs have been reduced.

Following upon the reduced prices for current, the average total revenue has diminished by nearly 0·9d. While this reduction in the revenue has caused a falling off in the percentage working profit, yet to it is no doubt largely due the splendid advance not only in the output but in the lamp connections. As compared with the output of 451,664 units in 1898-9 last year's record of 781,291 units sold marks an advance of 73 per cent., while the lamp connections show an increase of nearly 44 per cent. The load factor has risen from 10·9 per cent. to 12·5 per cent. To the favourable load factor

and also to the particularly high efficiency of distribution brought about by the practice of switching out transformers during the day time is due no doubt in large degree the excellent results exhibited by the Croydon undertaking so comparatively early in its career, and when the traction plant now on order is in operation, the costs are likely to show still better figures.

Kingston-upon-Thames Municipal Electric Supply Works.

We are glad to be able to record a decided improvement in the position of this undertaking. The accounts summarised in our table cover the period of 15 months ended on March 31 last, so that in any comparison of the figures it must be borne in mind that the winter proportion of the period was unduly large, and therefore favourable to lower costs.

Thanks to a very advantageous contract for the supply of coal having been made in 1899, prior to the rapid rise in the price, the fuel item has actually shared in the general reduction which has been effected in the costs. Notwithstanding this, however, the fuel item is more than double the average 1898 figures in stations of about the same size.

The other items, both of works and management costs, stand at satisfactory figures, with the result that, with the steady average revenue of about 5·9d. per unit sold, the working profit for the 15 months has increased more than pro rata in comparison with the previous year's result.

A new 200kw. steam alternator will soon be—if it is not already—at work, and by the completion of the low-pressure network of mains throughout the chief streets work on any high-pressure feeder is facilitated through the possibility of isolating it without interfering with the supply.

The following table indicates the progress made:—

Year.	No. of consumers.	Equiv. 8 c.p. lamp con.	Output units sold. Total.	Units sold to consumers.	Total rev.	Total expenditure.	Working profit.
1893–4	77	4,000	128,267	44,642	£1,985	£2,573	–£587
1895	99	4,800	134,084	67,445	2,442	2,704	– 262
1896	129	6,825	155,681	88,620	3,013	2,712	+ 301
1897	163	9,200	194,268	126,835	3,929	3,062	+ 863
1898	211	11,856	232,370	164,413	4,701	3,480	+1,221
15 months 1899–1900	311	16,130	364,000	264,155	7,485	4,750	+2,736

The following is a list of electric supply works the accounts of which have been analysed, together with the dates on which statements and analyses of accounts have appeared:—

CORRESPONDENCE.

TRANSPARENCY OF LIQUIDS TO ELECTRIC WAVES.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: I notice in this week's *Electrician*, under the heading "Contemporary Electrical Science," an abstract by Mr. E. E. Fournier d'Albe of a Paper by Mr. A. de Heen on "Electrical Transparency of Liquids." Reference is made therein to experiments identical in nature with some which I described in *The Electrician* in a letter about six weeks ago, carried out with an apparatus arranged by me several months previously for investigating the electro-optical qualities of bodies. I there stated I had examined a large series of liquids and compared them in respect of their powers of absorbing or stopping electric waves of about 8in. in wave-length. In Mr. E. E. Fournier d'Albe's abstract it is said that the liquids examined by M. A. de Heen could be divided pretty sharply into two classes, the transparent and opaque, also that carbon bisulphide is classified as one of the opaque liquids. The abstractor or author suggests that these differences between the liquids correspond with no other physical difference. As regards the above statements I should like to point out that my experiments showed carbon bisulphide to be a liquid particularly transparent to electric waves, and since reading the abstract I have repeated these experiments to confirm the fact. So far from being opaque like water, it is almost as transparent as turpentine or paraffin oil, and more so than olive oil or acetone. I pointed out, in my letter to *The Electrician*, that the opacity or transparency to electric radiation was determined by the magnitude of the dielectric constant of the liquid. If the dielectric constant is large and abnormal the liquid is opaque, if small it is transparent. Now bisulphide of carbon has a dielectric constant 2·67, and this value is normal, in that it is equal nearly to the square of the optical refractive index. I also drew attention to the fact that all liquids containing in their chemical molecule radicles such as HO, NO_2, and other easily-replaced atomic groups, have large or abnormal dielectric constants and considerable absorptive power for electric waves. Hence the remark in the abstract of Mr. E. E. Fournier d'Albe that the electro-optic absorption power runs parallel to no other physical difference is not quite correct, and bisulphide of carbon, being transparent, is no exception to the above-mentioned criterion. I may add, however, a mention of an experiment which was shown by me, with others, at the recent Royal Society soirée, which indicates that large dielectric constant *per se* is not the determining cause of opacity, but that opacity is really due to a sort of consequent good conductivity for high frequency oscillations. I prepared a number of thin glass tubes like small test tubes, and filled them with water. These were packed side by side in a wooden frame. It is clear that by thus laminating the water the conductivity of the mass in directions along and across the tubes was made very different, whereas owing to the thinness of the glass and its high dielectric constant the resultant dielectric constant of the mass was not so much altered in the two directions. When tested for electro optic opacity this system of water tubes was found to be opaque when the length of the tubes was held parallel to the electric force, but transparent when so held that the tubes were placed perpendicular to the electric force. This experiment seems to me to indicate that all liquids of high dielectric constant may be looked upon as good conductors for exceedingly rapid electric oscillations, but that this conductivity cannot be inferred merely from experiments with steady or low frequency alternating currents. It is however possible to distinguish between the qualities, and to make a liquid appear as if it were electro-optically transparent, even if it has a high dielectric constant, by, so to speak, laminating it like a dynamo armature. I find the same to be the case with a metal wire grating. If the wires are long and close enough, the screen is opaque to radiation with electric force parallel to the wires. If, how-

Digitized by Google

ever, the wires are cut up into very short lengths like a series of midget pins placed end to end, a grating formed of rows of these series is transparent to electric radiation, however close the rows may be placed, provided the pins do not quite touch each other. I must not encroach more upon your space at present, but shall hope later on to describe in detail numerous experiments on this subject I have made in the last half year.

—Yours, &c., J. A. FLEMING.

Pender Electrical Laboratory, University College,
London, July 14.

WIRELESS TELEGRAPHY.

In a Parliamentary Paper issued last Saturday as a Statement with regard to the additional Navy Estimates for 1900–1901, we notice an item, "Wireless Telegraphy Apparatus, £9,500."

The *Pall Mall Gazette* says the interest shown by the Kaiser in the development of the German navy has recently manifested itself in an order that every warship is to be fitted with apparatus for wireless telegraphy. The system to be adopted is not Marconi's, but that of Prof. Slaby and Count Arco, who have made daily experiments with it over long distances for many months past. They are said to abandon entirely the use of self-induction or choking coils and of "mixed metallic powders" in the coherer. A daily service of wireless telegraphy has (continues the *Pall Mall*) already been established with their instruments between Schiffbauerdam and Oberspree.

The *Engineer* states that of the 55 ships mobilised for the naval manœuvres this year, the "Adrienne," "Camperdown," "Jaseur," besides some others, are specially fitted for wireless telegraphy. The "Majestic" and the "Diadem" have also been fitted. The system is said to be not Marconi's, "which the Admiralty have found too expensive." Torpedo officers have charge of the installation in each case. The manœuvres this year will be entirely of a wireless telegraphy order.

On the general subject of the adoption of the Marconi wireless telegraph system by the Board of Trade, and in particular in reference to the answer given by Mr. Ritchie in the House of Commons on Friday last (elsewhere reported) to a question on the subject, Major S. Flood Page, managing director of the Marconi Company, in a long letter to *The Times*, says :—

I have recently returned from Borkum, where we have an installation worked half of the time by an ordinary German Government telegraphist, which is earning revenue daily. We have an assistant in the lighthouse at Borkum and another on the lightship 20 miles away. They take their tour of duty with the German telegraphists in receiving and transmitting shipping news, and communicating with the North Germrn Lloyd steamship "Kaiser Wilhelm dor Grosse" on her voyage into and out of Bremerhaven. This installation has been working for more than two months, and is interesting as being the first and only wireless telegraph receiving and transmitting ordinary intelligence worked by ordinary Government telegraphists, the messages being paid for on a commercial footing. A wire telegraph is fitted in the lighthouse which is in communication with the Continent, and messages received by wireless are repeated by wire telegraph in the ordinary way. Dr. J. A. Fleming, F.R.S., and I met recently, at Borkum, commissioners from Berlin to witness the working of the system, and they expressed themselves completely satisfied with the excellent demonstration which they received. The paying messages average about six a day, 10 being the greatest number received in any one day. Communication between lighthouse and lightship is thus used for the secondary object of sending commercial intelligence. This might have been done in England more than a year ago, as is well known to Mr. Ritchie, for he has himself seen the practical working on more than one occasion. The attitude of our Government towards this latest application of science to industry and commerce has been much the same as that exhibited towards every branch of electrical enterprise.

Mr. Hanbury, on behalf of the Post Office, said in the House of Commons that the Post Office would grant a licence to my company. I have before me a letter from the Post Office, dated May 1, 1899, stating that "the question of a licence to the company in respect of telegraphic communication between ship and shore by means of the Marconi system is receiving due consideration"; and in another letter, dated August 17, 1899, it is stated that the department is now in a position to discuss the terms of the licence, &c. Unfortunately the question of a licence got mixed up with the question of the use of the patents generally by the Crown, and we have not got the licence.

Some months ago we arranged with the South-Eastern and Chatham Railways to install our apparatus on their boats running between Dover and Calais. They are anxious to carry out the arrangement, as safety and security for passengers and economy in the cost of telegraphing, amongst other advantages, would have accrued; but their steamers are not fitted, some power prevents it. One rumour says that it is the French Government that prevents it; another that the English Post Office regard this purely commercial application to the needs of a purely commercial company like the South-Eastern as an infringement of the Post Office monopoly. The installation would only be used for the business purposes of the railway company; the public would not be able to use it. Anyway an obstruction exists; this hidden power, whatever it is, prevents the railway company availing itself of the advantages of wireless telegraphy, and hinders our earning the revenue which would accrue from this mutually advantageous and ordinary commercial transaction.

Perhaps we do come under the Post Office monopoly; perhaps we are exempt; perhaps we might be able to substantiate some claim to come under the exceptions of the Telegraph Acts. Certainly it is not our intention to be drawn into a dispute with the Post Office, whose monopoly extends only, as far as marine work is concerned, three miles from the coast. I presume there is no doubt that a steamer fitted with our apparatus may steam up and down the coast three miles and one yard from the shore and speak as much as they like to any station we may have on the coast without infringing the Post Office monopoly, and the burden of proof of that additional yard would hardly fall on the steamship. However, Mr. Hanbury's answer to Sir J. Leng in the House of Commons leads us to hope that ere long we shall not only have a free licence from the Post Office, but that they may give us a percentage of the additional business we shall bring to them.

I am glad to say the Admiralty is fully alive to the value of the system in its application to ships of war, and has arranged with this company to install the Marconi system on board more than 30 ships and torpedo stations.

Mr. Bullocke and four of our assistants landed on Saturday last from South Africa, and have reported that the Marconi apparatus fitted for about three months on four ships of Her Majesty's Navy in Delagoa Bay has worked day and night with complete success.

Mr. Ritchie, in Parliament the other day, said a departmental committee was sitting to deal with the question of communication by means of wireless telegraphy between lighthouses and lightships. As no one from this company has yet been called to give evidence I presume that our 12 months' successful working at the South Foreland has been taken as demonstrating the practicability of such communication.

PARLIAMENTARY INTELLIGENCE.

ELECTRIC LIGHTING IN THE EAST END OF LONDON.

On Wednesday the Select Committee of the House of Lords, of which the Earl of Camperdown is chairman, considered the act to confirm provisional orders made by the Board of Trade relating to Battersea, Limehouse, Mile End Old Town, and St. George's-in-the-East.

Mr. WORSLEY TAYLOR, Q.C., said there was no opposition to the Battersea order. He appeared on the Limehouse order, which was identical with the others. Mr. Shiress Will, Q.C., appeared on the St. George's order, and Mr. Baggallay on the Mile End order, and probably one opening would suffice, there being also only one petition, that of the County of London, which was directed against all three districts. In the session of 1897 this company got a provisional order confirmed for supplying electricity in Limehouse, Mile End Old Town, and St. George's-in-the-East. The point which all three local authorities made was that up to the present the company had done absolutely nothing to supply electric light in any one of the districts. The authorities thought the time would come when they ought to have electric light, and that they were the best people to supply it, and the result was that they all obtained provisional orders. If the case stopped there it would be a strong one; but a material change had been effected since 1897 by the County of London Local Government Act, 1899, under which the three districts in question, with Whitechapel, would form the new borough of Stepney. Whitechapel had an order, and a site on which were works which they could expand up to about 15,000 H.P., and this would carry them on for years. The average price per unit charged by the company was 4½d., whereas that of the Whitechapel District Board of Works was only 3d., and therefore on the mere ground of cheapness the local authorities were justified in their action. In section 3 of the order it was provided that as from the date of the announcement of the Order in Council establishing the new metropolitan borough of Stepney the undertakings and areas of supply under the three orders should be deemed to be one undertaking and one area of supply; so that the Board of Trade had not merely given the authorities the right to supply themselves but had rolled the whole thing up into one. It was for the company to show why these authorities should not be allowed to supply themselves rather than for the authorities to show why the bill in the public interest ought to pass. The company had tried, by bills, to get power to connect their St. Luke's works with the East-end districts, but failed. Then they turned to the Regent's Canal, and he believed had bargained for a wayleave along the towing path there.

Major P. CARDEW said the generating station at present existing in Whitechapel was on a good site. The existing plant was not very large, the supply not having been started very long. It would be possible to place plant of 15,000 H.P., or equal to 10,000kw. on the site, which was about 2½ acres in extent. The system of supply was the low-pressure direct; that from the St. Luke's station high-pressure alternating, though he believed they had a certain amount of low-pressure plant there, too. Comparing the positions of the two stations—one in Whitechapel and one in St. Luke's—he thought the advantage, from a commercial point of view, rested with the Whitechapel station. He thought the present action of the local authorities justified. With regard to competition, his view would be very different if the company had already expended a large sum of money in the district; but as they had spent nothing they had no right to complain. If a company was doing its duty and carrying out a thoroughly efficient supply there was an element of unfairness in the local authority (having consented to the coming in of the company) wanting to compete.

Digitized by Google

Cross-examined: Supposing our failure to supply in this district and to do our duty is entirely owing to the action of the local authority and the County Council, do you not think it unfair that they should come in?—No. I think the difficulty you are in is the result of your deliberate policy. You deliberately decided that you would supply from a station which had no access to the district. I think you must stand or fall by that policy.

Mr. W. JAMESON, surveyor to the Whitechapel district, said the electrical works were created under his supervision. The boiler capacity at present was about 600 H.P. or 700 H.P. The works were started just before last Christmas, and were now supplying very nearly to their full capacity—about 15,000 lamps. There was a quantity of machinery on order, which would be delivered probably within the next three months, and would quadruple the power of the station. The average charge in Whitechapel for electric current was about 3d. per unit. The authority supplied a considerable number of small motors for sewing machines in connection with the East-end clothing trade, &c. For shops taking the light for a considerable period the Whitechapel charge worked out to less than the cost of gas. A new building at the site of the works was in course of construction.

Mr. PARKER, assistant engineer of the Whitechapel district, said he believed that 3d. would be a remunerative charge in the district. The demand for electric current was increasing. It would take about two years to make the necessary arrangements to supply the new district.

Mr. RATCLIFF, clerk to the Limehouse District Board, said the company's act received the Royal Assent in 1897. They were bound to carry out the works by September, 1899, but they only gave notice at that date of their intention to lay the mains. No notice was taken of this intimation, and after the expiration of a month there would be no statutory powers to object to the laying of the mains. The company, however, had not even yet commenced to lay mains.

That was the case for Limehouse.

Mr. KNIGHT, engineer and surveyor of the Mile End Old Town District gave details as to the steps taken by the three districts to join with White chapel in securing the revocation of the County of London Company's powers and the promotion of their own order. It was not true that the company had been delayed by the districts in the carrying out of their order of 1897. His district had an acre of land on the canal on which there was a destructor, and that they could use for the building of an electricity generating station. The County of London Company had never done an inch of work in the Mile End Old Town district.

Mr. BAGGALLAY, Q.C., submitted that at the present moment the County of London Company's powers were capable of being revoked by the Board of Trade. The company would not be injured, save that they had had to pay the costs of getting the order of 1897, which they had not carried into effect.

Mr. THOMPSON, vestry clerk of St. George's-in-the-East, said his Vestry had not received a communication from the Board of Trade stating that they declined to revoke the company's 1897 order. His Vestry had made suggestions to the Board of Trade for the amendment of the company's supply, but without success.

Mr. SHIRESS WILL pointed out that when the company obtained their powers in 1897 they were bound to supply electricity to the districts from a generating station within the districts. They had delayed through endeavouring to get the supply from the generating station in another district authorised by their act of 1892. The Board of Trade had sanctioned the present order, and the bill confirming it had passed the House of Commons.

Mr. BRAITHWAITE, jun., deputy-chairman of the County of London Company, said his company, having obtained their order had endeavoured to obtain wayleaves through intervening districts in order to supply electricity from St. Lukes, the company, seeing that the economical way to supply would be from that district. A bill for the wayleaves was rejected in 1899. They had now succeeded, at considerable expense, in getting wayleaves from the Canal Company, and the company were prepared at once to commence laying down plant, having all the necessary capital available. The company had already gone to considerable expense in making provision for special plant. They had plant for 500kw. at their City-road Station in view of the supply of these eastern districts, and a deal of this plant would be idle if not so used. Besides, the company now proposed to supply motive power as well as lighting, and to do that had made arrangements for new and special plant. The districts were power districts, and the supply must be economical. It would not be economical to generate the electricity in the districts themselves.

Yesterddy Mr. CHARLES P. SPARKS, chief engineer to the County of London Company, said his company had endeavoured for some time to obtain wayleaves from their generating station to Mile End Old Town, Limehouse, and St. George's. They had at length been successful in obtaining wayleaves along the Regent's Canal for a distance of 3¼ miles. They proposed to lay down four conduits. They would begin to supply under their present two-phase system till they got the permission of the Board of Trade to supply continuous current. The capacity of the City-road station was 2,200kw. The maximum load last winter was 1,260kw. with 450kw. reserve, which would have been available for the east-end district. This year they would have a reserve of 500kw., in addition to the supply from the original plant. He pointed out that difficulties had been put in the way of the company in the matter of wayleaves and the laying of mains in the east-end districts. The company supplied electricity in its northern district at the rate of about 4d. per unit for lighting and 2½d. for power. The capital expenditure in making use of the wayleaves which had been acquired would be £11,000 to carry 1,500kw. over a distance of 3½ miles. The cost of pipes would be 17 per cent. of the total, the cost of the cables would be 66 per cent., and the cost of labour, supervision, &c., 17 per cent. The amount to be paid for wayeaves was £300 a year for three years and £500 a year after that.

Cross-examined by Mr. Worsley Taylor, Q.C.: Within about 15 months every shilling of the company's existing capital would be utilised.

Mr. WORSLEY TAYLOR: Very well; that brings us to the bottom of the hardship to you of the passing of this bill.

WITNESS said that the total capacity of the company was 3,400kw., which, if the normal rate of increase was maintained, would be utilised in 15 or 16 months.

By the CHAIRMAN: The company supplied St. Luke's, Clerkenwell, and other places in the north, and between that district and the district they proposed to serve lay the districts of Bethnal Green and Shoreditch, and part of the City. To supply the district in dispute wayleaves through a district which they did not supply were necessary.

In re-examination, WITNESS said that the two-phase system had been adopted in order to give a supply to the east-end districts. They were studying economy in this matter, and in order to give an effectual supply they had spent a great deal of money. At Christmas, 1901, the existing plant at the City-road works would be fully occupied, but they had further plant for the accommodation of the east-end on order. His company were supplying the City of London Company with electricity in bulk, that company having had some difficulty to encounter. Their supply would end in a few months, and would relieve machinery for supplying 450kw., or, with reserve, 600kw.

The CHAIRMAN: I gather that you do not think it would be remunerative for any one to supply the new Stepney borough alone?—I do not include Whitechapel. We do not supply or propose to supply that.

The CHAIRMAN: You mean that St. George's-in-the-East, Mile End Old Town and Limehouse could not supply themselves economically?—Yes.

But they could be supplied economically from Whitechapel?—Yes. These gentlemen have taken our case, and applied it to themselves.

Mr. S. MORSE, solicitor to the petitioners, gave a history of the electric supply orders affecting not only St. George's, Mile End Old Town, and Limehouse, but also Whitechapel. His company had promoted a bill to enable them to reach Mile End and the other parishes through Whitechapel and Shoreditch. The Committee who considered the bill decided not to give the powers asked for, which were of a wide character. They then asked for permission to communicate from their existing station to the districts they had power to supply, but it was said that the bill was so altered that it would be necessary to drop it at that period, and come again to Parliament for fresh powers. In 1899 the company submitted to the Board of Trade the system of supply they proposed to use. Witness then quoted from correspondence and resolutions of the local authorities to show that the east-end districts had held a conference, and had decided to get the London County Council to assist them in obstructing the carrying out of the company's works. The London County Council accordingly adopted obstructive tactics, and effectually prevented the company from carrying out their works from Sept. 30, 1899, to March 3, 1900, when the Board of Trade ruled that they were out of court. On Sept. 23 the local authorities through certain members of Parliament, waited upon the Board of Trade, and endeavoured by an *ex parte* statement to get that department to revoke the order granted to the County of London Company for the supply of the east-end district. The Board of Trade, without hearing the company, but knowing what they were doing, decided that they should not be interfered with. Witness detailed the arrangements entered into between the North Metropolitan Railway and the Canal Company and the County of London Company for wayleaves from the City-road station to Mile End Old Town, and said if this bill were to pass the company would be bound for three years to pay £300 a year. He did not think Mile End Old Town had power to stop their laying mains in the district. When the agreement was entered into the company knew the present orders were pending. He did not know, however, what the bill had to do with the agreement. The bargain was made deliberately with their eyes open. In 1897, when the company got their order, it could only have been carried out by getting a generating station in the district itself or obtaining wayleaves, for Parliament had rejected that part of the bill which would have enabled the company to get a connected supply distinct from the City-road to Mile End Old Town.

By the CHAIRMAN: His company had power to lay mains in Mile End Old Town, that district not having objected within the statutory period.

Mr. MOON, for the company, first dealt with the two legal points, first as to their legal right to carry their mains along the Regent's Canal.

The CHAIRMAN: That right is not disputed.

Mr. SHIRESS WILL: I contend that the agreement with the Canal Company is not binding, not having been sealed.

The CHAIRMAN: But it could be completed to-day. All you say is that it is incohate. There is no question as to power to enter into the agreement to grant the wayleave.

Mr. SHIRESS WILL: No doubt.

Mr. MOON said that according to the decision of the Committee, the agreement might be made conclusive. It had been partly fulfilled as already two payments of £75 each had been made by the company. As to the contention that the company had no power to break up roads through a district other than their area of supply, in order to give communication between the generating station and the area of supply, he quoted from the decision of the Committee presided over by Lord Cross, which sat to consider that amongst other questions, to the effect that compulsory power for works might be given under such circumstances. It was held that to come under that decision the bill giving the power for breaking up streets must also have contained the power to set up the generating station, but this he contested, the decision of Lord Cross's Committee having made no reference as to the time at which power to break up streets should have been given. He went on to point out that the company had power to supply this east-end district and had already gone to great expense to put that power into operation, and that to pass this bill would be to render

Digitized by Google

the local authorities competitors. And the Committee must bear in mind that the only ground on which Parliament had allowed a local authority to compete with existing undertakers in the supply of electricity had been that of failure on the part of the private company to carry out their statutory obligations. And no doubt the main argument of the promoters was that the County of London Company had not carried out their powers. Against this he reminded the Committee that the company had been obstructed in their endeavour to obtain wayleaves, as their attempt to secure a continuous district of supply had been defeated. Moreover, the Committee must recollect that the Board of Trade had been applied to to revoke the company's provisional order, and had declined to do so, and declined without calling on the company to reply to the arguments of the applicants. So far from having done nothing to fulfil the order, the company had done a great deal though they had not at that moment expended any money in the districts of the particular local authorities promoting the present bill. Besides the cost of obtaining the provisional order, they had put down two-phase plant with the object of supplying these districts. They had adopted a special type of plant to enable them economically to transmit the current to Mile End, and they had provided at St. Luke's station an excess quantity of power amounting, with reserve, to 600 kw., which they would utilise for the new district at once. Finally, the company had used their best endeavours to carry out the order they had obtained in 1897, and had now obtained the necessary wayleaves and were in a position to commence supplying the three eastern districts in from four to six months, and under the circumstances there was nothing to justify the passing of the bill, and, as a consequence, the revocation of the company's order.

Mr. SHIRESS WILL summed up for Mile End Old Town. He said that so far as the district was concerned it would be better for the new borough of Stepney (which would one day be the purchasing authority) to have a complete undertaking within its own boundary than to have an electric light installation perfect in everything but the generating station.

The CHAIRMAN said that no doubt if they were beginning *de novo* the interests of the inhabitants of the district would be consulted in that matter, but as things were it was impossible to ignore the existence of the Brush Company and of their order.

A dispute arose as to what had been said in evidence on the two-phase system, and the chairman recalled Mr. Sparks, who stated that the two-phase system was used over a large part of their area of supply north of the Thames, and in the whole of a separate area of supply south of the Thames. The two-phase system was the most modern system for distributing electricity at a distance.

Mr. W. M. ACWORTH replied for Limehouse.

Mr. BALFOUR BROWNE, Q.C. waived the right of reply.

The CHAIRMAN then announced that the Committee had decided that the bill might proceed.

Discussion arose on the question of the payment by the promoters of the costs incurred by the company in connection with their provisional order and in relation to the supply of the east-end districts.

Mr. BALFOUR BROWNE said that if these costs were paid the company would agree to the cancellation of their order.

The answer of the local authorities could not then be given, and the matter stands over till to-day (Friday).

METROPOLITAN DISTRICT RAILWAY CO.'S BILL.

This bill was considered on Friday by a Select Committee of the House of Lords, presided over by Viscount Portman.

Mr. POPE, Q.C., for the promoting company, said that for many years the question of electric traction had engaged the serious and constant attention of the promoters. Electric traction had hitherto only been applicable to lighter railways than those usually employed in this country, and the main difficulty had been found to be the extreme draught and weight of a train capable of carrying passengers in such numbers as were carried on the District Railway. For two years Sir John Wolfe Barry and Sir William Preece had been engaged in experimenting as to the best mode of applying electric traction to the purposes of that railway, and a certain measure of success had attended their efforts. At present an experimental train was running between Earl's Court and High-street, Kensington, to test the applicability of the scheme. The bill was to enable the company to carry out the system of electric traction which the two engineers had proposed. They sought to acquire a site at Chelsea Creek for a generating station; they had been able to arrange with the local authorities to lay mains below the streets to carry the energy from the station to the railway. It had, however, been found necessary to lay an alternative cable. This they proposed to lay on the extreme margin of the lands of the West London and West London Extension Railways. This would involve no real interference or injury to those railways, and he (the learned counsel) considered it at least a selfish policy for the Great Western and the London and North Western Companies, who were the owners of the line, to deny the District Railway the right to lay this electric main.

Sir JOHN WOLFE BARRY said the advisability of employing electric traction had been for a considerable time before both the Metropolitan District and the Metropolitan Railway Companies. A year or two ago the District Company obtained leave from Parliament to work their line electrically, but they did not obtain powers to purchase land for a generating station, nor facilities for laying electric mains and conducting the power to the railway. They conveyed about 50,000,000 passengers a year, and the new system would be an enormous benefit to the public. Last year the Metropolitan and District Railways placed at his disposal a sum of £20,000 for the purpose of conducting experiments on the working of their full-sized trains. Up to that time in this country no full-sized train had been worked electrically on steep gradients, and it was thought desirable to have a full-sized experiment. This was made on the line between Earl's Court and High-street, Kensington, on which there is a gradient of 1 in 42, and had been entirely successful. They were able to travel more quickly, to start the train more rapidly, and to convey heavier loads than with steam locomotives. The site for the generating station at Chelsea Creek was very suitable. No residential injury would be caused, and, being on the Thames, coals could be economically conveyed, and water obtained for condensing purposes. The electrical conductors would be placed in cast-iron boxes, about 9in. by 15in., laid 2ft. below the surface of the street. The object of the alternative route was to duplicate their cable, as they would have to duplicate all the plant. He did not think the laying of the main would interfere with the petitioning railway companies' property. The estimates for land were £58,000 and for buildings £55,000, and the total cost to fit the District Railway for working electrically would be about half a million.

Sir WILLIAM PREECE said, in conjunction with the previous witness, he had conducted experiments between Earl's Court and High-street, Kensington, with a passenger traffic heavier and greater than anything that had been done anywhere, even in America. The results had been highly satisfactory. The introduction of electricity as a motive power on the underground railways would be of great benefit to the public. It would clear the atmosphere of the underground railways; it would secure a beautiful light in the carriages, and it would enable the speed of the trains to be increased. As to the site for the generating station, they had never been able to find a site so advantageous as that at Chelsea. He felt strongly the necessity of an alternative route. Though he had had 47 years' experience of electricity, they were every day being met with something new and unexpected. They must have, in electrical enterprises, two strings to their bow, and he objected to a great railway traffic like theirs being dependent upon a line of pipes going through the streets. In his opinion the placing of the conduits on the extreme verge of the railway would in no sense interfere with the traffic or with the convenience of the railway. He could form no estimate of how long the cable would last. The only experience of a similar main was that from Deptford to Trafalgar-square. The distance was 7 miles or 8 miles. The cables had been down five years. They were worked at very high pressure—10,000 volts—such as they also proposed to use, and during that period of five years there had been only one fault—only one occasion to open the street. His impression was that the interests of the Chelsea Electric Supply Co. would be fully protected by the clauses of the Board of Trade and of the Consolidated Electric Lighting Act of 1899. They had no intention of competing with the Chelsea Co. in the supply of electricity.

On Monday Sir JOHN WOLFE BARRY, recalled, said Sir Wm. Preece and himself had carefully considered this site for the generating station at Putney before deciding on the Chelsea site. There were many objections to the Putney site. It was in an important residential district. The site would not be large enough for the work they contemplated, and it was not central, being at the extreme end of one of the District Railway's lines. He knew many cases in which companies had asked to put up power stations in residential districts, but Parliament had declined to allow them to do so. In the case of the Chelsea site, Parliament had already authorised the erection of a generating station there, and their company had met with no objections.

Mr. WEDDERBURN, Q.C., for the owners of the West London Railway, said for the first time in his experience a trading company was seeking to carry its lines along the property of a railway company. The promoters had entirely failed to prove that public necessity which alone could justify such an interference with private property.

Mr. SHIRESS WILL, Q.C., for the West London Extension Railway, took the same line of argument.

The CHAIRMAN said the Committee found the preamble of the bill proved, but they would not sanction the laying of the alternative line of pipes on the property of the railway companies.

Clauses having been adjusted, the bill was ordered to be reported, as amended, to the House.

WALSALL CORPORATION BILL.

On Tuesday the Select Committee of the House of Commons, of which Col. Gunter is chairman, considered this bill, which included a proposal to re-equip the existing tramway system and to make extensions both inside and outside the borough, including extensions to Bloxwich, Willenhall, Walsall Wood, and through Great Barr to the boundary of the adjoining district of Perry Barr, whence a line will be made by the local authority of Perry Barr through their area and connecting with the existing tram system to Birmingham. The overhead trolley system is proposed. A petition by residents asked that if the Committee sanctioned any part of the scheme the Corporation should not be allowed to go outside their own boundaries.

Mr. W. J. SMITH, mayor of Walsall, said the inhabitants of Birmingham's road were practically unanimously favourable to the tramway scheme, which he explained was much needed to bring in the outside population on market days. At present these people entered the borough in carriers' carts and other similar conveyances. The line would be much used to convey people to the pleasant country district of Great Barr, and as giving a direct route to Birmingham. It was not anticipated that the tramway would be profitable for the first year or two, and the deficiency, if any, under the bill would be thrown on the borough rate, and would not fall on the outside district served by the line. He believed, however, that the tramway system as a whole would pay.

Several witnesses were then called, who gave evidence as to the local need for and advantage of the tramways.

Mr. R. GREEN, C.E., who prepared the plans and sections and the estimates of expense in connection with the bill, said: From an engineering point of view this was one of the easiest systems of tramway he had been connected with. There was an existing tramway system in the town which the Corporation proposed to acquire, and which would require to be re-laid and be re-equipped. The total expenditure contemplated was £160,050,

Digitized by Google

which included £25,000 for the extensions of the generating station and cars. The suggestions made by the opponents that Birmingham-road should be re-laid with wood would be impracticable. In the first cost of granite as compared with wood there was not much difference; but in a case like this granite would have three times the life of wood, besides which the annual cost of maintaining wood was much greater than that of maintaining granite. From a sanitary point of view also he much preferred granite. The steeper the incline of a road the more difficult wood became for horses; and there were some considerable gradients in this scheme. Nor would wood pavement lessen the noise of a tram. He considered that in very narrow streets two lines were better than one, and it was provided that in all cases where there was less than 7ft. 6in. between the outer rail and the kerb, there should be a double line. Without any special expense for widening or other things the cost of the overhead trolley system was estimated at about £12,000 per mile. The overhead trolley system was very much cheaper than other electrical systems of traction.

After hearing the evidence of the petitioners against the bill and counsel on their behalf,

The Committee passed the preamble of the bill, which, after clauses had been considered, was ordered for report.

LONDON UNITED TRAMWAYS BILL.

The Select Committee of the House of Lords, presided over by Lord Rosse, on Friday last resumed consideration of this bill. Strenuous opposition was offered by frontagers along the route of the proposed branch line along the Richmond-road, Twickenham, to a point near to Richmond Bridge.

A number of local witnesses in support of the scheme closed the promoters' case.

Mr. EARLE, for the Middlesex County Council, said the desire of the Council was to protect their roads from aggression. The effect of these tramways would be to increase the population of the districts through which they would run, and therefore it was desirable that the ordinary requirements as to width of road should be insisted on. He submitted that the payments to be made by the company to the District Councils should be taken into account in the settling between the Middlesex County Council and the District Councils in regard to the upkeep of the roads.

Mr. FITZGERALD, Q.C, explained that a portion of the tramways in the Acton district would have been purchasable by the Acton Council in 11 years, but in consideration of their agreeing to grant a uniform term of 24 years the company had agreed to make a payment of £400 a year to the Council.

Evidence in support of the frontagers' petition was then taken.

Mr. C. A. BRERETON, C.E., said he resided at East Twickenham. He did not think Richmond-road a suitable one in which to lay down a tramway, owing to the abruptness of its curves and to its circuitous route.

Further similar evidence having been given,

Mr. WHEELER, Q.C., for the frontagers, condemned the trolley system as wholly objectionable, urging that there was nothing final about electric traction which, in the same way as steam, had supplanted horse-power, and might itself be supplanted before very long—and he referred in this connection to the progress being made in motor cars—in which case it would be impossible to restore Richmond-road to its present attractive condition. He entirely declined to assent to the view that, because enormous sums of money had been spent on local authorities, and because these local authorities had given their consent to the scheme, therefore they represented local feeling. These assents he held had been given because of action on the part of the company which would render outlay on their part unnecessary when that outlay had to be faced.

Without calling on counsel for the promoters to reply, the CHAIRMAN said the Committee found the preamble proved.

A clause giving the Middlesex County Council certain protection in regard to the roads having been agreed to, the bill was ordered to be reported for third reading.

GLASGOW DISTRICT TRAMWAYS BILL.

Questions of *locus standi* in regard to this bill were considered by the Court of Referees of the House of Commons on Thursday last. The bill is being promoted by Mr. W. M. Murphy and others and seeks authority to construct two groups of electric tramways, one in and around Paisley and the other in and around Renfrew. When the bill was before the House of Lords the proposed line between Govan and Renfrew was struck out, Glasgow Corporation undertaking to promote next session a similar line as part of the Glasgow tramways system. The petitioners against the bill to whose *locus standi* the promoters objected were the Glasgow and Renfrew District Railway Co., the Corporation of Glasgow, Paisley and Barrhead District Railway Co., Glasgow and South Western Railway Co., and Glasgow and Paisley Joint Line Committee. When the Court of Referees met it was found that the petitions of the Corporation of Glasgow, Glasgow and South Western Railway Co., and Glasgow and Paisley Joint Line Committee had been withdrawn.

Representatives of the Glasgow and Renfrew and the Barrhead District Railways having declared that the electric tramways would seriously compete with their lines,

Mr. PEMBROKE STEPHENS, Q.C., for the promoters, admitted there would be a certain measure of competition, but contended that such competition was not sufficient to justify a *locus standi* being granted. With a view to meeting objection from the railway companies, the promoters had reduced their parcels-carrying limit from 500lb. to 56lb. They thought that that concession would end the difficulty.

The Paisley and Barrhead Co. and the Glasgow and Renfrew District Co. were granted a restricted *locus*.

ELECTRIC POWER BILLS.

In the House of Commons on Monday, on the consideration of the Durham (County of) Electric Power Bill, Mr. CALDWELL moved that the Standing Orders be suspended, and that the bill be read a third time.

Mr. GALLOWAY objected to special facilities being given to the promoters of this bill. The motion was, however, agreed to, but on the motion that the Standing Orders be suspended in order that the bill be read a third time, Mr. Galloway repeated his objection to the bills being rushed through the House under special facilities.

A division was challenged, but not persisted in, and the bill was ultimately read a third time, as were also the Lancashire Electric Power Bill and the South Wales Electrical Power Distribution Bill.

The North Metropolitan Electric Power Supply Bill was read a third time in the House of Commons on Tuesday.

LIVERPOOL OVERHEAD RAILWAY BILL.

This bill, which authorises the construction of new electric railways at Seaforth and Liverpool, the widening of a short portion of the system in Liverpool, and increases the capital powers of the company, was passed by the Unopposed Bill Committee of the House of Commons on Friday last, after passing the committee stage of the House of Lords.

Royal assent has been given to the Southport Extensions and Tramways, Stockport Corporation Tramways, Lincoln Corporation (Tramways, &c.), and the City of London Electric Lighting bills.

WIRELESS TELEGRAPHY IN LIGHTHOUSES.

In the House of Commons on Friday, in answer to Sir J. Colomb, Mr. RITCHIE said he understood the experiment of establishing electrical communication with the East Goodwin light vessel was regarded as successful. The experiment having been completed, the apparatus was removed, and whole question of electrical communication with light stations had, as he had previously stated, been referred to an inter-departmental committee, on which the Post Office, the Treasury, the Admiralty, and the Board of Trade were all represented. He was not aware of the name of the receiving office in Germany with which the Borkum light vessel was in communication, and was, therefore, unable to state the distance between the office and the vessel. The distance between the East Goodwin light vessel and the receiving office in England was about 10 miles. The mere practicability of establishing communication was not the only question to be considered. Very difficult questions of patent rights were involved, and the question how to deal with those rights needed careful handling.

Mr. J. LOWTHER: Are steps being taken to expedite the settlement?

Mr. RITCHIE: I have expressed to the Committee a hope that they may speedily make their report.

CABLE COMMUNICATION BETWEEN BRITISH COLONIES.

In the House of Commons last night, Mr. TOMLINSON asked the Secretary of State for the Colonies whether he was aware that, although the island of Jamaica is now in direct telegraphic communication with the British Empire through British cables by Turks Island, Bermuda, and Halifax (Nova Scotia), no steps have yet been taken to establish direct communication between Jamaica and the other West Indian islands, and that the cables connecting Jamaica with the fortified coaling station of St. Lucia and the islands of Barbados, St. Vincent, and Trinidad, and the other West Indian islands, as well as the mainland of British Guiana, all touch foreign soil at one or more points. Also whether British Honduras is also dependent upon foreign cables, and that if a colonist in British Honduras wishes to telegraph to the United States or England he has to take a journey into the neighbouring Republics of Guatemala or Spanish Honduras in order to do so.

Mr. J. CHAMBERLAIN: The facts are as stated. The points raised in the question have been carefully considered, and will not be lost sight of. Considerable expenditure would be involved, and I cannot promise any immediate action in the matter.

PROPOSED CABLE TO WEI-HAI-WEI.

In the House of Commons, on Tuesday, the CHANCELLOR OF THE EXCHEQUER stated, in reply to Sir C. Dilke, that the proposed cable to Wei-hai-wei was not to be laid from Gutzlaff, but from the Saddle Islands, which were some 30 miles further seawards. The Great Northern Telegraph Co. had no station on those islands. Arrangements would be made for the working of the new cable by a British staff. Negotiations were in progress with the Eastern Extension Telegraph Co. as to the ownership of the cable. Pending the result the company are to lay and work the cable.

TELEPHONIC COMPETITION.

In the House of Commons, on Friday, Mr. HENNIKER HEATON asked the Secretary to the Treasury the amount paid by the National Telephone Co. as royalty on their gross receipts last year, and where this sum was to be found set out in the public accounts.

Mr. HANBURY: The amount paid by the National Telephone Co. to the Post Office as royalty for the year ended March 31, 1900, was £134,115, and this amount will be found included in the finance accounts (p. 23), described as "Telegraph Service, Gross Receipts."

Mr. G. BOWLES: Does the Government propose to enter into competition with the company with a view to extinguishing this receipt?

Mr. HANBURY: The Government are, in this matter, carrying out the wishes of Parliament, which has decided that there shall be competition.

LEGAL INTELLIGENCE.

Attorney-General v. National Telephone Co. (Ltd.).

This case came before Lords Justices Smith and Vaughan Williams in the Court of Appeal yesterday on the appeal of plaintiff from an order of Mr. Justice Bucknill dated June 12, 1900.

Mr. H. F. DICKENS, Q.C., said Mr. Justice Bucknill ordered that the case should be tried with a jury. The plaintiff appealed from that order on the ground that the causes of action and the defences set out in the pleadings disclosed no questions in which the jury could render any assistance, and that if any question of fact arose at all they would depend upon an enormous amount of correspondence and negotiations which could not conveniently be set before a jury. Counsel said the action was brought by the Attorney-General on the relation of the London County Council and by the London County Council against the defendants to restrain them from committing a nuisance by opening the streets in the metropolis for the purpose of laying their telephone wires, and also for a declaration that the defendants were not entitled to do that except under certain consents by certain of the Telegraph Acts. Plaintiff also claimed a declaration that defendants were not entitled to break up the streets whenever they liked for the purpose of repairing their wires when so laid. The telephone company were, he contended, practically claiming to have the right to lay their telephone wires not under the powers of the Telegraph Acts at all, but because they had the consents of local authorities. Of course that raised a point of law—viz., whether the company could have the right against the Attorney-General to create a nuisance. The points of law raised were no doubt important ones, but his submission was that it was not a case in which a jury could render any assistance.

Lord Justice SMITH said that on looking at the pleadings he thought there was a question of fact raised as to whether the telephone company had caused any obstruction in the streets which would rightly be decided by a jury.

Mr. DALDY, on the same side, argued that this was a proper case to be tried by a common law judge sitting without a jury. The action was for an injunction and for a declaration, and could have been brought in the Chancery Division.

Their LORDSHIPS, without calling upon Sir Edward Clarke for the company, dismissed the appeal, with costs.

Othen v. Electrical Undertakings (Ltd.).

In the Chancery Division on Saturday Mr. Justice Cozens-Hardy heard a debenture stockholder's action against the company and the trustees of the deed. All the parties consented to take the judgment in the settled form, with the appointment of a receiver and manager. The court appointed Mr. C. E. Hare receiver and manager, to act for four months, but would not give him liberty to borrow £500 to carry on the business, stating that the parties would have to take out a summons in chambers for that purpose.

Workmen's Compensation Act.

Recently at the Bury County Court an application was made for an order for the payment of 12s. per week as compensation under section 8 of the Workmen's Compensation Act to E. Clegg, formerly in the employ of Mr. A. Greenhalgh, Radcliffe. It appeared that it had been agreed between the parties that Clegg should receive 12s. per week as compensation for injuries received. Difference arose, however, as to whether or not Clegg should attend each week at the works to receive the money, and he had been distinctly told that unless he did so the money would not be paid. There was nothing in the act which stated that a man must attend at the works in order to receive compensation, nor did it state that the money should be sent to him, but it was contended that the general law which applied to other debts and the general practice of the county court must be taken to cover the clause in the act.

After hearing arguments,

Judge J. K. BRADBURY pointed out that the clause meant that the person who paid was to get a discharge from the person who received the money, and did not say where the money was to be paid. He did not think it was the duty of the creditor to go for payment, and he made an order that the respondent should pay the weekly compensation at the residence of the applicant. The judge refused to grant an order in stay of execution in view of an appeal by the insurance company, the chief party affected by the decision.

Ellis *v.* Knott was an appeal action tried in the High Court recently It was desired to set aside the award of Judge Smyly, Q.C., at the Derby County Court. Appellant Ellis was a joiner, and respondent Knott was employed by him as a machinist. Part of respondent's duty was to work at a circular saw. While so working in August, 1899, he met with an accident, one of his fingers being cut off by the saw and two other fingers being injured. His average weekly earnings were 36s. An agreement was arrived at by which appellant agreed to pay respondent 18s. a week. A memorandum of this agreement was registered in the County Court, stating that appellant was to pay respondent a weekly payment of 18s. as compensation, "such payment to continue during the incapacity of the respondent, or until such time as the same should have been ended, diminished, or increased according to the provisions of the Act." In November, 1899, appellant offered to take respondent back into his employment at the same wages as before, but respondent refused the offer. Appellant thereupon filed a request for arbitration to review the weekly payment. The respondent at this time was earning about 10s. a week at other employment. At the hearing medical evidence was given as to whether respondent was fit to work at the same employment as before the accident, and the evidence of appellant was to the effect that the offer which he made was to employ the respondent at the same work at which he was working before the accident, and at the same wages. The County Court Judge said that, in his view, respondent could not work at the same employment at which he worked before the accident, or earn at that employment the wages he then earned; and that, therefore, he ought not to compel a man to go back to the employment to which he objected to go, even though the employer offered to make things easy and pay him his full wages. He further held that the sums respondent was then earning were no justification for reducing his allowance. He made an award refusing to reduce the weekly allowance.

Lord Justice COLLINS held that the appeal failed. The finding of the County Court Judge was that the man was no longer capable of earning the same wages at the same work at which he was employed before the accident. That work was, upon the evidence, the only work at which he could, as a mechanic, earn wages of that amount. Having lost one of his fingers and two other fingers being injured, the man was not fit to work at the circular saw. That was the only work offered to him by the appellant. The finding of the judge was, therefore, a finding that the man's earning capacity had been diminished. Having arrived at that fact, everything else followed, and the amount of the weekly payment was for the judge to determine, after giving due effect to all proper considerations.

Lord Justice Vaughan Williams and Lord Justice Romer concurred, and the appeal was dismissed, with costs.

MUNICIPAL, FOREIGN & GENERAL NOTES.

Aberdeen.—The question of authorising the National Telephone Co. to put their wires underground is at present under consideration by the Finance committee. Last week a representative of the directors of the company attended before the committee to explain the company's proposals. He said the expenditure necessary to put the wires underground would be from £35,000 to £40,000, and the company would undertake not to increase the present charge for telephone service provided the necessary sanction to lay their wires underground were given. The company would also make other concessions. No decision has yet been come to.

Bermondsey (London).—The Vestry have received notice from the London County Council of intention to seek Parliamentary powers to construct an electric tramway on the conduit system along the new Tower Bridge southern approach.

Bradford.—A special meeting of the Council was held on Wednesday when the estimates for the current year were submitted and approved. The recommendation of the Electricity committee to apply for sanction to borrow £140,000 for electric lighting extensions was adopted.

Brechin.—Plans of the proposed electricity station building to be erected by the Angus Electric Light & Power Co. have been approved by the Police Commissioners.

Bristol.—At the meeting of the Electrical committee, held on Friday, Sir William Preece's report on the scheme for the extension of the electricity undertaking prepared by the borough electrical engineer (Mr. H. Faraday Proctor) was discussed. The report approves the scheme, and it was resolved to instruct the architect (Mr. H. Williams) to prepare the necessary drawing, specifications, and quantities, and when this preliminary work is completed to advertise for tenders. Extensions of the mains were also authorised.

British Chamber of Commerce, Paris.—The report presented at the twenty-sixth annual general meeting of this Chamber, dealing with the statistics of Anglo-French trade of 1899, and containing also comparative statistics with the previous year and a compendium of French legislation in 1899, is just issued by the British Chamber of Commerce, 25, Boulevard des Italiens, Paris.

Cardiff.—The Electric Lighting committee have authorised the engineer (Mr. N. Appelbee) to obtain quotations for an additional 500 H.P. steam alternator. The existing plant at the station is sufficient only to meet next winter's demand. The committee have also decided on Mr. Appelbee's recommendation to obtain a coal conveyor at £560.

Chartered Institute of Patent Agents.—The qualifying examination of persons desirous of being registered as patent agents will be held in November. A copy of the notice giving full particulars can be obtained on application to the secretary of the Institute, 19, Southampton-buildings, London, W.C.

Cork.—The Council have sanctioned the use by the Cork Electric Tramways & Lighting Co. of overhead wires for the supply of electric current in the suburbs.

Chatham.—The Council have decided to consult an electrical expert as to the purchase of so much of the undertaking of the Chatham, Rochester and District Electric Light Co. as is within the borough.

Dublin.—The electric tramway from Clontarf to Howth is practically completed, and the Board of Trade inspection will take

Digitized by Google

place this week. The cars will run to and from the Nelson Pillar and the Hill of Howth, arrangements having been made with the Dublin United Tramways Co. to use that portion of the system.

Dunstable.—An increase of 5d. a thousand in the price of gas, coupled with the receipt of two notices of intention to apply for provisional orders, have induced the Council to take up the proposal to establish municipal electricity works. In the course of a discussion last week the deputy-mayor (Ald. F. T. Garrett) said he was in a peculiar position by reason of the notice given by his firm, Messrs. F. T. & A. Garrett & Co., electrical engineers. They had served a similar notice upon the Upper Houghton authorities. He had not wanted to force the hands of the Council at this juncture, though he had held the opinion for a long time that it was a question which the corporation should take into consideration. In case the corporation should not take the matter up, he thought electric lighting powers should not go into the hands of a company of which they knew nothing. It would be better for the undertaking to go into the hands of a local company or firm rather than those of outsiders. There was nothing to prevent the corporation obtaining an order and transferring it to a company; but his opinion was that the Corporation should undertake the work themselves. If the Corporation decided to take the matter up themselves he should be pleased to arrange to hand over his interests in regard to the neighbouring authorities to the Council. He should support the proposition to appoint a small committee to make inquiries as to cost, &c. He thought an electric lighting undertaking properly installed and properly equipped was bound to be a remunerative one. Ultimately it was unanimously decided to appoint a committee of four to make the suggested enquiries. This committee consists of the mayor (Mr. Ald. Perkins), the deputy-mayor (Mr. Ald. Garrett), and Messrs. Bosketh and Nash. There are several private electric plants in the district, including that at the big printing works of Messrs. Waterlow & Sons (Ltd.).

Electric Cycle Cleaners.—Mr. H. J. S. B. Cunliffe, M.A., writes:—

"Can I have my cycle house (which is already illuminated by electricity) fitted up with any sort of appliance for brushing my cycles and polishing them? Surely, if dentists can have an appliance of the sort that I have now in my mind fitted up in their consulting rooms for drilling teeth, it ought not to be a very hard matter to have a light contrivance fitted up in a cycle house for cleaning a machine, seeing that the 'bits' used would never be larger than a lamp chimney brush. Also, is there any means whereby electricity can be adapted to rotate the cylinders of an ice-cream making machine?"

Mr. Cunliffe's address is the New Club, Brighton, and perhaps makers of this class of apparatus will communicate direct with him.

Electric Railways and Tramways in Saxony.—On Dec. 31, 1899, the total length of the electric railways and tramways in Saxony was 142 miles, compared with 101¼ in 1898. The lines employed 131 motor cars and 289 trailers, compared with 591 and 238 respectively in 1898. On the accumulator cars a device has been introduced to overcome objectionable smells from the acid of the batteries. Upon several lines electric heating has been adopted.

Electric Traction in West London.—Mr. J. Clifton Robinson, managing director and engineer of the London United Tramways, writes to say that the preamble of the company's bill was passed by a House of Lords committee on Tuesday. A report of the proceedings before the committee appears on p. 491 of the current issue, and particulars of the committee stage in the Lower House appeared in our issue of May 11. Mr. Robinson states that the whole of their extensive scheme in West London, embracing extensions to Heston, Isleworth, Twickenham, Teddington, Hampton, and Hampton Wick, will at once be proceeded with. The present lines are already equipped, and will shortly be opened for traffic.

Electrical Enterprise in Italy.—The municipal authorities of Montorio al Vomano are applying for a concession to utilise the water power of the River Vomano for the generation of electric current for the lighting of the town.

Some experiments with electric accumulator traction have just been carried out on the Bologna-San Felice branch of the Rete Adriatica Railway. The test was made with a special car, similar to a Pullman, and it is stated that a speed of 70 kilometres per hour was attained. Similar experiments are shortly to be made on the Modena-Parma line.

Electricity in Mining.—At the meeting of the Burma Ruby Mines (Ltd.) on Tuesday the chairman (Sir Lepel H. Griffin) said their agent telegraphed on 6th inst. that both the electric plants were working satisfactorily. He thought they might look upon those electrical installations as the axis on which their future prosperity was to turn. If they had chosen to work in the old-fashioned way, with an enormous expenditure on fuel, fuel growing dearer each year, he was perfectly certain that the company would never have been a success. They had the intelligence, directly working by electricity was proved in other parts of the world to be a success, to adopt it in Mogok, and with the very best possible results.

Gloucester.—The electricity works were formally opened yesterday (Thursday).

Greece.—According to a report just published the Athens and Piræus Railway Co. must, according to the conditions of its franchise, adopt electricity as the motive power on its lines within the next three years. The length of the railway is 5 miles, extending from the quay at Piræus to the business centre of Athens. Along the route there is a tunnel three-quarters of a mile in length. It is stated further that a Belgian company, which owns and works a steam tramway in the same district, proposes to adopt electric traction.

Grimsby.—The Corporation have received the sanction of the Local Government Board for the issue of £57,538 Corporation stock for electric lighting and other purposes. Tenders are to be invited for the stock.

Hornsea.—The Council had a conference with Messrs. Bennett and Ward Thomas, on Monday, as to the proposed electric lighting and tramway scheme for the district. The chairman (Mr. T. B. Holmes, J.P.) said they were prepared to entertain a light railway scheme to Bridlington, but it would be of no benefit to Hornsea at present to have a tramway. However, if the company for which Messrs. Bennett and Ward Thomas were acting obtained an order for the light railway to Driffield, the Council would then discuss the scheme for Hornsea.

Hospital Lighting.—The Governors of Lincoln Hospital have decided to adopt electric lighting.

Kidderminster.—The town hall and municipal buildings are to be wired for the electric light.

Lancaster-Morecambe Electric Tramway.—A scheme for the construction of an electric tramway between Lancaster and the west end of Morecambe is being promoted by Mr. John Gardner, of Morecambe, and it is probable that parliamentary powers will be applied for next session.

Leigh.—Application has been made by the Council for sanction to borrow £5,000 for electricity works.

Light Railways.—The following dates have been provisionally proposed for the holding of inquiries by the Light Railway Commissioners:—

July 23. Kingston, Surbiton, & Dist. (1899) and Extens. (1900).	Sept. 26. Wigan.
„ 24. Hayling Island.	„ 27. Hyde and Dukinfield.
„ 26. Norwich and Dereham.	Oct. 10. Durham & District & West Hartlepool Extens. (1899).
„ 30. Bath and District.	„ 11. Jarrow and South Shields.
Aug. 3. Mid-Anglian (1899) and amending (1900).	„ 12. Wales & Laughton & Barnsley & District (Exten. No. 2).
Sept. 20. Rhyl & Prestatyn (Exten.).	„ 17. Kidderminster and Bewdley (Extension No. 2).
„ 21. Pwllheli and Nevin.	„ 25. Swansea and District.
„ 22. Warrington and Runcorn.	„ 26. Llanelly and District, and
„ 24. Windermere and District.	„ 27. Rhondda Valley.
„ 25. Blackburn—Burnley.	

Limerick.—An inquiry was held here last week into the application of the Council to borrow £20,000 for electric lighting. Mr. Baker, of the Gas committee, said he would advise the Corporation to undertake electric lighting even if it involved some loss. Plans and technical details of the scheme were submitted by the consulting engineer (Mr. J. Enright).

London County Council.—At Tuesday's meeting, £30,500 was loaned to Whitechapel for electric lighting. On the recommendation of the Asylums committee a capital expenditure of £39,000 was authorised for the construction and equipment of a generating station for the supply of electricity and water to the Horton Asylum. Of this sum £18,000 was for electric lighting plant. On the application of Shoreditch Vestry the Council consented to the erection of a new generating station at Bath-place, Haggerston.

Manchester.—An inquiry was held on Thursday last into the application of the Corporation for sanction to borrow £188,890 for electric lighting extensions. Mr. Hudson, deputy town clerk, explained that the sum formed part of £500,000 which it was decided to borrow in March, 1899. Particulars of the remainder of the proposed expenditure were not yet in a sufficiently advanced state to lay before the inspector. The city electrical engineer (Mr. C. H. Wordingham) gave technical details. He stated that there had been a great increase in the demand for electric current. The increased output in 1898 was at the rate of 31 per cent, in 1899 it was 43 per cent., and in the present year the percentage, so far, was 24. With regard to the supply of electricity for tramways he expected that three sections of the tramways would be in operation by the end of the year.

Melton Mowbray.—The local electric light company are about to start laying electric lighting cables. The Council will reinstate the roads at the company's expense.

Moss Side.—Sanction to a loan of £12,000 for re-laying the tramlines for electric traction has been applied for by the Council.

Municipal Telephony.—At the meeting of the Huddersfield Corporation on Wednesday Ald. Calvert moved the adoption of the recommendations of the Electricity committee to apply to the Postmaster-General for a licence to establish and work a telephone

Digitized by Google

exchange in the Huddersfield area for 25 years. Mr. Riley thought that before the Council committed themselves to any expenditure they should have information as to the probability of the scheme being remunerative. Ald. Calvert said the estimates of expenditure and revenue had been gone into. The cost would be £30,000 for the whole scheme. He did not think there could be any doubt that they or any other municipality would be able to use the National Telephone Co.'s wires in other towns if their messages went over the trunk lines. Ald. J. L. Walker was not opposed to municipal telephones, but they ought to be sure before taking an important step of that kind that there would be an interchange of messages between the National and the Corporation systems. The town clerk (Mr. F. C. Lloyd) supported the statement of Ald. Calvert with regard to inter-town communication. The company was under obligation by agreement with the Postmaster-General to distribute in other towns the messages they received over the trunk wires from the Corporation exchange. He pointed out, however, that the case was somewhat different in regard to the urban districts outside Huddersfield, and as to the position these places would be in there was certainly a difference of opinion. Ultimately the Council confirmed the committee's recommendations by a substantial majority.

At the meeting of the Manchester Telephone committee on Tuesday a letter was read from the manager of the National Telephone Co. (Mr. W. E. L. Gaine) in reply to the suggestion made by representatives of the committee, that the company should sell their plant in the Manchester telephone area to the Council. The reply was, we believe, in the negative, but a counter proposal, made by Mr. Gaine, is, we understand, to form the subject of an interview between the parties.

Obituary.—The death is announced of Mr. Hamilton Smith, mining engineer, which took place at Durham, New Hampshire (U.S.A.), on 4th inst. In addition to his connection with many mining enterprises, Mr. Smith was also associated with the Electric Traction Co., the Central London Railway Co., and the Anaconda Copper Co.

The death is announced of Mr. Alexander Bruce, manager of Dumbell's Bank and chairman of the Isle of Man Tramways & Electric Power Co. (Ltd.), which took place at Douglas on the 15th inst.

Parsons' Turbo-Alternators.—The Corporation of Frankfort-on-Main (Germany) has placed an order with the newly-formed Brown Boveri-Parsons Syndicate for a 4,000 H.P. single-phase turbo-alternator for the extensions to the Frankfort electricity station. The plant installed at this station consists of four 500kw. and two 1,000kw. units, and two further 1,000kw. units are being erected. Throughout the plant at Frankfort is single-phase, yet the total capacity of the motors connected to the mains exceeds 5,000 H.P. The turbo-alternator now on order will run at 1,360 revs. per min., giving current at 3,000 volts. It will be capable of giving its full output of 4,000 H.P. when working on an inductive load having a power factor of 80 per cent., and will be provided with a special winding by means of which it can be made to generate three-phase current with an output of 5,000 H.P. This set will be much the largest turbo-alternator ever made, and is designed to rival in power the largest reciprocating steam engine ever built for direct connection to electrical machinery.

Roumania.—A company, entitled La Société des Tramways et Eclairage Electrique de Braila, has been formed, with a capital of £160,000, for erecting electricity supply works, and constructing an electric tramway in Braila, Roumania. The Helios Co. is interested in the venture.

Sao Paulo (Brazil).—In May last the Sao Paulo Railway, Light & Power Co. commenced the supply of current for lighting this city of 300,000 inhabitants. The station and works generally were designed by Mr. F. S. Pearson, the works have been carried out under the supervision of the engineer-in-chief, Mr. Greaves, and Mr. R. C. Brown is manager of the company. The alternating-current system with four-wire distribution at 400 volts is used. Current is supplied for lighting, power and traction. The company is itself the owner of a railway which commenced working in April with 10 single-decked cars on the overhead trolley system. The company leases the water power owned by the State, which will equal 10,000 H.P. upon the completion of their works. The Sao Paulo Company has recently acquired the concession granted by the municipality of Santos to Drs. Santos da Silva and Joao da Silva Martins for the introduction of electric traction into that city. The company has petitioned for an extension of the concession to enable it to run electric cars to different points not already served by the local tramways company. The district possesses a private telephone service at a subscription of $15 per annum or 10s. per month.

Scholarships.—As a result of the recent Scholarship Examinations at the Electrical Standardising, Testing and Training Institution, the following awards have been made by the Board of Control: To Mr. F. E. Berry, Wellingborough School, Maxwell Scholarship value £52. 10s., tenable for two years, and to Mr. A. W. Scrooby, of Dunheved College, a prize value £21.

Southport.—A Board of Trade inquiry was held on Tuesday into the Corporation's application to borrow £40,000 for reconstructing and electrically equipping the Birkdale and Southport tramways, with which the Southport and Ormskirk light (electric) railway will ultimately connect. The present loan will bring the Corporation's expenditure on electric tramways to £135,500, and this sum will be further increased by £50,000 or £60,000 when the reconstruction of the Churchtown tramways is taken in hand. £66,000 has been expended on new lines to the Blowick and High Park district, which Mr. A. P. Trotter officially inspected on behalf of the Board of Trade on Tuesday. The lines were opened for traffic on Wednesday.

South Shields.—An inquiry was held here last week into the application of the Council to borrow £36,750 for electric lighting extensions. The application was supported by the town clerk (Mr. J. Moore Hayton), and technical details were given by the borough electrical engineer (Mr. J. A. Jeckell).

Tunbridge Wells.—An interesting review of the progress of the electricity works at Tunbridge Wells appears in the Tunbridge Wells *Advertiser* for July 13 accompanied by an interview with the borough electrical engineer, Mr. Horace Boot, whose exhaustive project for dealing with the large demand for current in Tunbridge Wells has now been adopted in its entirety. Under this scheme, as our readers are aware, £25,000 is to be expended. This extension is the fourth that have taken place since the works were first established.

Valencia (Spain).—A French company has recently taken over the tramways of this city, 25 miles in extent, and is substituting electric for steam and horse traction. Already electric cars are running between Valencia and the park. The trolley system is used. The cars are of Spanish construction, and the electrical equipment is Belgian.

Vladivostock.—A concession for the construction and working of electric tramways and of public and private electric lighting in Vladivostock has recently been granted. The tramway is to be about 12 miles in length.

Water Power in Canada.—The Shawinigan Water & Power Co., lessees of the Shawinigan Falls, are completing the equipment of their extensive works for the transmission of power to Montreal, a distance of 80 miles. The capacity of the works when these arrangements are completed will be almost unlimited, and the scheme will place Montreal in the front rank for cheap power for manufacturing purposes. The works will be completed during the summer, and will at first provide power for 30,000 H.P., to be subsequently increased to 75,000 H.P. This power will be available in the spring of 1901. The main cables will traverse the line of the Great Northern of Canada Railway, which runs in a direct line west from Shawinigan Falls to Joliette, from thence overhead to the island of Montreal, being taken into the city by underground route. So far little has been done in Montreal to put electric power into general use for industrial purposes. Owing to the low cost of development at Shawinigan, competition between steam and electricity will be very keen at Montreal, where the average price of steam coal is 12s. 6d. per ton.

West Bromwich.—The foundation stone of the electricity station buildings at Black Lake was laid by the Mayor (Ald. S. Pitt) on Monday.

Workhouse Lighting.—The Holborn (London) Guardians recently decided to put down independent plant for the electric lighting of the City-road workhouse, but at the next meeting of the Guardians Mr. Putterill will move that current be taken from either the Shoreditch Guardians or the County of London Company, on the ground that this course would be more economical than the guardians generating their own current.

The House committee has been requested to reconsider the question of adopting electric lighting at the Kidderminster workhouse, and to submit particulars of cost of wiring, with relative cost of electric and gas lighting, &c.

Worksop.—An inquiry was held here on Tuesday into the application of the Council to borrow £15,579 for electric lighting. Plans and technical details of the scheme were submitted by the consulting engineer (Mr. A. B. Mountain). The chairman of the Lighting and Paving committee (Mr. Ilett) said the Council were unanimous in regard to this loan. It was most desirable to adopt some improved method of public lighting as there had been considerable complaint for some years past as to the gas lighting.

Wurtemberg.—Telephone rates in this city have been recently reduced to £4 per subscription per annum, with an additional charge of ½d. for communicating over the local circuit, over distances of 9 miles 1d., 31 miles 2d., and beyond this distance 6d.

Outing.—The employés of the Robertson Lamp Works held their annual excursion on Saturday when a party of over 200 spent the day at Hastings.

Digitized by Google

TRADE NOTES AND NOTICES.

[*Notices for insertion under the above heading must reach the Office not later than first post Thursday morning. New Catalogues, Price Lists, and similar matter should be sent early in the week.*]

TENDERS INVITED.

As announced in an advertisement the *Pacific Cable* committee invite tenders on behalf of Her Majesty's Government, the Governments of Canada, New South Wales, Victoria, New Zealand, and Queensland for the manufacture and laying in the Pacific Ocean of 8,272 nautical miles of telegraph cable between Vancouver and Queensland. The whole undertaking will be divided into three contracts, and a fourth contract is also proposed for surveying and sounding the whole route before the cables are laid. Forms of contract, specification, and particulars may be obtained from Messrs. Clark, Forde & Taylor, 4, Great Winchester-street, London, E.C., where tenders must be lodged by noon of Tuesday, 14th prox.

The Electric Lighting committee of the Vestry of *St. Mary, Islington* (London) require tenders for relaying York and other stone, and providing new York and other stone where necessary, over the electric conduits and mains which may be required during the ensuing three years. Further particulars are set out in an advertisement, and specifications may be obtained at the electricity department, 50, Eden-grove, Holloway, N. Tenders to the vestry clerk (Mr. Wm. F. Dewey), Vestry Hall, Upper-street, N., by noon of 25th inst.

Halifax Corporation invite tenders for combined steam engine and alternator, alternators, static transformers, induction motors, rotary converters, and three-phase extra high-tension switchboards. Specification may be obtained from the borough electrical engineer (Mr. H. F. Street), Foundry-street, Halifax, and tenders must reach the town clerk (Mr. Keighley Walton) by noon of Tuesday, 31st inst. An advertisement contains further particulars.

Barnes Urban District Council is prepared to receive offers of terms from "free" wiring firms for wiring premises in the Barnes district. Applications to Mr. John Eustace Anderson, clerk to the Council, High-street, Mortlake, S W., before 6th prox. An advertisement gives some further particulars.

Glasgow Corporation require tenders for concentric and single main cables, particulars of which are set out in an advertisement. Specifications may be obtained from the engineer (Mr. W. A. Chamen), 75, Waterloo-street, Glasgow, and tenders must be lodged with the town clerk (Sir J. D. Marwick) on or before 26th inst.

Grimsby Corporation invite tenders for wiring their electricity works. Specifications may be obtained from the town clerk (Mr. W. Grange), St. Mary's-gate, Grimsby, and tenders must be in by Aug. 8. An advertisement gives further information.

Dorking District Council invite offers for leasing their provisional order. Tenders to clerk (Mr. Geo. Scales), 65, High-street, Dorking, by Aug. 30. See advertisement.

Salford Electric Light committee invite tenders for nine transformers and 4½ miles of low-tension concentric cable. Tenders to chairman of committee by 10 a.m., 27th inst.

Salford Corporation invite tenders for laying cables, tramway feeders, and street lighting. Tenders to town clerk by Aug. 13.

Hull Corporation invite tenders for an electric lighting installation at the Springhead pumping station. Tenders to chairman Water and Gas committee, Town Hall, Hull, by 10 a.m., 23rd inst.

Hull Corporation also require tenders for five high-tension continuous-current rotary transformers, with switch gear and accessories. Tenders to chairman of Electric Lighting committee, by noon of July 26.

Sunderland Corporation invite tenders for coal-conveying plant for their electricity station. Tenders (addressed chairman Lighting committee) to town clerk by noon of 27th inst.

Aston Manor District Council require tenders for the supply and erection of electricity generating plant. Tenders to chairman Health committee by noon 24th inst.

Darlington Corporation require tenders for arc lamp posts and brackets. Tenders to town clerk by 28th inst.

Rugby District Council invite tenders for leasing their provisional electric lighting order (1898). Applications to clerk by Aug. 1.

Bradford Corporation invite tenders for steel girder and steel trough rails and fishplates. Tenders to town clerk by 28th inst.

Stockport Tramways committee invite tenders for 20 double-deck tramcars with electrical equipment. Tenders to clerk by Aug. 31.

Torquay Council require tenders for additional generating plant. Tenders by Aug. 6.

Cardiff Corporation require tenders for ten 30kw. transformers. Tenders to clerk by July 24.

Barcelona Harbour committee invite tenders until Oct. 2, for elevators, lifts, &c., for the new commercial depository building of the port.

TENDERS RECEIVED AND ACCEPTED.

Shoreditch (London) Vestry have accepted the tender of Messrs Babcock & Wilcox for four boilers for the electricity works at £5,600, and for four economisers at £880. The following is a list of the tenders submitted:—

Dry Back Boilers.

	4 boilers.		8 boilers.
Fleming & Fergusson	£9,300	...	£17,500
D. Stewart & Co.	7,705	...	15,245
Davey, Paxman & Co. (10 boilers)	14,169		
Hodge & Son	6,250	...	12,300
Fraser & Co.	5,889	...	11,579
E. Danks & Co.	5,500	...	11,005

In Fraser & Co.'s tender the amount of £250 was added for work not included in the specification for the four boilers, and £600 for the eight boilers. In Davey, Paxman & Co.'s tender £700 was added for a stoker. Danks and Co.'s quotation for an economiser of 960 tubes was £1,776, and that of D. Stewart & Co. £1,943. 6s.

Water Tube Boilers.

	4 boilers.		8 boilers.
Babcock & Wilcox marine type (*accepted*)	£5,600	...	£11,200
Ditto land type, Green's make	5,500	...	11,000
D. Stewart & Co.	7,097	...	14,027
W. R. Renshaw & Co.	6,248	...	11,996
B. R. Rowland & Co.	5,655	...	11,145
E. Danks & Co.	...	...	11,005
Stirling Boiler Co.	4,283	...	8,490

In Babcock & Wilcox Co.'s accepted tender for economiser, a B. & W. 350 sq. ft. economiser is specified. The same firm's alternative tender for land-type boilers specifies the price for economiser (Green's make) £1,650. Danks & Co. and D. Stewart & Co. tender for economisers at the same figures as in the dry back boiler tender.

The following tenders have been received for the electric lighting of Thorp Perrow, Yorkshire, for Mr. N. C. Allfrey. Mr. Morgan Williams, C.E., 39, Victoria-street, Westminster, S.W., is consulting engineer:—

Mavor & Coulson...(*accepted*)	£1,995	Cox-Walkers	2,400
Ditto (alternative)	2,051	Ditto (alternative)	2,280
Ditto (alternative)	2,030	Bland Bros.	2,380
J. H. Holmes & Co.	2,575	Walker & Hutton	2,250
Ernest Scott & Mountain	£2,504		

Glasgow Corporation have accepted the tender of Messrs. Mechan. & Sons for the switchboard for the Port Dundas station at £1,122. The contract for the supply of carbons for 12 months has been divided between the International Electric Co. and the General Electric Co.

London County Council has accepted the tender of Messrs. J. T. Mayfield & Co. for the installation of telephones, tell-tale clocks, fire alarms, and call-bells at the Horton Asylum for £1,655.

Grimsby Town Council have accepted the tender of Messrs. Chamberlain & Hookham for electricity meters, and that of Messrs. Mackenzie Bros. for arc lamp posts.

The tender of Messrs. Bardell Bros. has been accepted by the Lynn Council for extensions of the electricity station buildings at £1,178.

APPOINTMENTS VACANT AND FILLED.

Bolton Corporation invite applications for the post of electrical engineer to take charge of their electric lighting and tramway undertakings. Further particulars are set out in an advertisement, and applications must be delivered to the town clerk (Mr. R. G. Hinnell) not later than 30th inst. The Corporation are offering a salary of £500 per annum, with annual increments of £50 to a maximum of £700.

An electrician-in-charge is required for the Huddersfield Corporation electricity station. An advertisement contains further particulars, and applications must be sent to the borough electrical engineer (Mr. A. B. Mountain), St. Andrew's-road, Huddersfield, by 26th inst.

Manchester Tramways committee require an experienced traffic superintendent. Particulars from the general manager (Mr. J. M. McElroy), and applications (addressed to chairman of committee, Town Hall, Manchester) must be sent to the town clerk (Mr. Wm. Henry Talbot) before Saturday, 28th inst. See advertisement.

The Hoylake and West Kirby District Council require a clerk of works, to act under their consulting engineer, for their electricity supply undertaking. An advertisement contains further particulars, and applications must be sent to the clerk (Mr. Roderick Williams), Town Hall, Hoylake, by 26th inst.

British Electric Traction Co. (Ltd.), Donington House, Norfolk-street, Strand, London, W.C., have a vacancy for a first-class draughtsman. See advertisement.

An assistant is required in the engineering department of the Merchant Venturers' Technical College, Bristol. Applications to registrar by Aug. 13. See advertisement.

The Governors of the Birkbeck Institution invite applications for the position of head of the physics department. Applications to the principal, Bream's-buildings, Chancery-lane, E.C.

Digitized by Google

A demonstrator and assistant lecturer in physics is required for the University College of South Wales and Monmouthshire, Cardiff. Applications to secretary, by Sept. 9.

Mr. Arthur Wigram, with Messrs. Willans & Robinson, Rugby, has been appointed junior assistant engineer at the Sunderland Corporation electricity works.

The British Electric Works Co. have appointed Messrs. Gent & Co. agents for Newcastle and district. Mr. S. Haynes has been appointed Nottingham agent to the company.

Mr. R. A. D. Macalister, of Hanley, has been appointed assistant electrical engineer at Greenock at £120 per annum.

BUSINESS NOTICES.

B.E.T. Staff Changes.—Mr. James Devonshire having been appointed a member of the committee for Associated Undertakings, has vacated the position of district superintendent for London and South Eastern district; Mr. Daniel F. Sugrue has vacated the position of district superintendent for the Eastern Counties district, and will undertake certain supervisory duties for the management. Mr. George Stevens has resigned the position of secretary, and has been appointed chief district superintendent, with charge of the London and South Eastern and Eastern Counties districts. Mr. Charles H. Dade has been appointed secretary; and Mr. Ernest Hopwood has been appointed districts secretary.

Mr. W. G. Rhodes, M.Sc., M.I.E.E., has resigned his position as chief lecturer in electrical engineering at the Royal Technical Institute, Salford, to join Mr. T. M. Hewitt, formerly manager of Messrs. Mather & Platt (Ltd), and now carrying on business as consulting mechanical and electrical engineer, Tower Chambers, Brown-street, Manchester. In future the business will be carried on at the same address under the style of Hewitt & Rhodes.

The General Electric Co. of New York notify the opening of a London office at 110, Cannon-street, E.C. It is stated that the business of the company will be conducted in close accord with that of the British Thomson-Houston Co. (Ltd.) and the companies owning general electric patents in various countries, or who are licensed thereunder. The office will be open for the sale of general electric apparatus and supplies to the colonial and ex-territorial trade.

Messrs. J. A. Aiton and J. L. Clark (trading as Clark & Aiton), consulting engineers, 102, Fenchurch-street, and 25, Laurence Pountney-lane, London, E.C., 25, Water-street, Liverpool, and 75, Buchanan-street, Glasgow, have dissolved partnership.

Messrs. Welch, Fry & Skelton, electrical engineers, are removing to Salisbury House, London-wall, London, E.C.

Messrs. Babcock & Wilcox (Ltd.) are removing to Oriel House, Farringdon-street, London, E.C., after 23rd inst.

BANKRUPTCIES, LIQUIDATIONS, &c.

The trustee in bankruptcy of Thos. Ford (trading as Thos. Ford & Co.), electric fittings manufacturer, Victoria Works, Emily-street, Highgate, Birmingham, has been released.

The trustee in the bankruptcy of H. J. Wimshurst, electrical and motor car engineer, 4, Foleshill-terrace, Coventry, has been released.

A receiving order has been made against Leonard Francis, electrical engineer, 13, Corporation-road, Southwold, Suffolk. The first meeting of creditors will take place on 21st inst., at 8, King-street, Norwich, and the public examination on 24th inst., at the Town Hall, Great Yarmouth.

The discharge of F. G. W. J. Adams, electrical engineer, lately trading in partnership as Downie & Adams at 24, Newman-street, Oxford-street, W., has been suspended for two years.

A meeting of creditors of W. J. S. Green, electrician, &c., of Aston, was held last week at Birmingham. The statement of affairs showed liabilities £279. 5s. 4d., deficiency £266. 17s. 7d. Bankrupt, who assigned heavy expenses and bad trade as causes of his failure, executed a deed of assignment in 1894, with liabilities of £182. 18s. 10d., of which £20 was still owing, and the adverse balance gradually accumulated from that time. The Official Receiver was appointed trustee.

L. Francis, electrical engineer, 13, Corporation-road, Southwold, has been adjudicated bankrupt.

The Brockie-Pell Arc Lamp (Ltd.) is to be wound up voluntarily for purpose of reconstruction. Mr. D. F. Basden, 33, St. Swithin's-lane, E.C., is liquidator. Particulars of the registration of the new company are given in another column.

Claims against the Dawson Gas Engines Syndicate (Ltd.) must be sent to the liquidator (Mr. A. S. Chapman), 7 and 8, Ironmonger-lane, E.C., by Aug. 28.

Patent Amendment.—Notice is given in an advertisement that the Société Anonyme Pile Bloc, 27, Rue de l'Hotel de Ville, Lyons, France, has applied for leave to amend specification of Letters Patent No. 16,597 of 1896, granted to MM. R. M. J. Heurtey and P. Germain for "Improvements in and relating to primary batteries." Particulars of the amendment are given in the *Illustrated Official Journal* (Patents) of the 11th inst., and notice of opposition must be given within one calendar month from that date.

Insulating Fibre.—Messrs. Cort & Co., 277, Camberwell New-road, London, have issued a new wholesale price list of insulating fibres, hard and flexible, and of balata, gutta-percha and cotton belting.

Radiography Apparatus.—Messrs. Isenthal & Co., of 85, Mortimer-street, London, W., have issued the third edition of their radiographic list, which can be obtained on request.

Westinghouse Plant.—The British Westinghouse Electric Co.'s circular No. 1,028, just issued, is devoted to a description of Westinghouse rotary converters, several important installations of this plant being illustrated.

Burglary.—Mr. A. P. Lundberg has again been the victim of the housebreaker (the third time in six months). Unfortunately, on this occasion the loss has been considerable, some valuable tools having been removed. Correspondents are invited to communicate with Mr. Lundberg in the event of their letters having remained unanswered or remittances unacknowledged.

Exports of Electrical Apparatus and Material.—The following list gives official particulars of the exports of British manufactured electrical apparatus and material (including telegraph and telephone wire and material, but not including electrical instruments or machines, which are not separately specified) from July 11 to July 17, with the ports of destination:—

Africa—Alexandria, £104; Cape Town, £212; Durban, £289 (including £151 telegraph material); East London, £442; Port Elizabeth, £760. *Argentina*—Buenos Ayres, £1,083 (including £914 (telegraph material). *Australasia*—Brisbane, £26; Melbourne, £38; Perth, £16; Sydney, £226; Wellington, £120 (telegraph cable). *Austria*—Fiume, £21. *Azores*, £166,000 (telegraph cable). *Belgium*—Ghent, £15. *Ceylon*—Colombo, £75. *Chili*—Boca, £1,141. *China*—Shanghai, £86. *Germany*—Hamburg, £374 (including £350 telegraph material). *Gibraltar*, £78. *Holland*—Rotterdam, £150 (telegraph material). *Hong Kong*, £230. *India*—Bombay, £446; Calcutta, £800 (including £260 telegraph wire). *Mauritius*, £165. *Straits Settlements*—Singapore, £12,357 (telegraph material). *Turkey*—Constantinople, £10. Total £185,264, against £6,912 in the corresponding week last year (July 12 to 18).

PATENT RECORD.

The following list of Applications for Patents and Specifications published has been compiled for this journal by Messrs. J. C. Chapman and Co., *Chartered Patent Agents, of 70, Chancery-lane, W.C., from whom any available information in connection with Patents, Designs, and Trade Marks may be obtained.*

APPLICATIONS FOR PATENTS.

Note.—*The undermentioned Applications are not open to public inspection until after the acceptance of the complete Specification. The names within parentheses are those of communicators of inventions. When complete specification accompanies application, an asterisk is affixed.*

April 30, 1900.

7,983. J. N. Maskelyne, jun. London. Improvements in electrical signalling.

7,989. W. F. Jones. London. Improvements in electric switches.

7,997. O. Kammerer. London. A new and improved electric gear for cranes.

May 1, 1900.

8,013. H. O. Farrell. Manchester. Improvements in and connected with electric switches.

8,015. A. Ballance and S. A. Jefferson. Hull. A new or improved method and apparatus for electric railways and traction purposes.

8,019. J. Dewar. Glasgow. Improvements in and relating to winches for raising and lowering arc lamps.

8,022. A. H. Midgley. Bradford. Improvements in dynamos and electro motors.

8,028. G. W. Holt and A. J. Hallam. Birmingham. Improvements in and relating to electric bells or instruments requiring vibrating motions.

8,061. J. A. Poché. London. Overhead electric protector for conductors.

8,067. A. T. M. Johnson and G. Guyott. London. A new or improved method of tuning electric currents and producing musical sounds by electrical agency.

May 2, 1900.

8,103. A. G. New. Woking. Improvements in electric igniters for internal combustion engines and the like.

8,107. The British Electric Works Co. (Ltd.) and B. Brander. Birmingham. Improvements in or connected with telephone instruments.

8,111. The British Electric Works Co. (Ltd.) and B. Brander. Birmingham. Improvements in parts of telephone instruments.

8,116. F. A. Williams. Manchester. Improvements in the construction of casing and capping, and in the means of attaching same together for use in connection with electrical installations.

8,122. B. C. Bouquet. London. The improved electrical fusible cutout.

8,123. H. Oppenheimer. London. Improvements in and connected with electric light wall plugs. (Actien-gesellschaft Mix & Genest, Germany.)

Digitized by Google

8,153. W. L. Wise. London. Improvements in transformers. (The Actien-Gesellschaft Elektricitäts-werke vorm. O. L. Kummer & Co., Germany.)*
8,160. W. Ely. Liverpool. Improvements in electric switches.*

May 3, 1900.

8,179. W. F. Jones. London. Improvements in electric switch apparatus.
8,181. C. J. Wightman and A. Hudson. Bradford. Improvements in junction boxes for the conduits or casings of electric wires.
8,201. G. H. Barnes. Birmingham. Globe or shade holder for gas, oil, or electric light fittings.
8,207. The British Thomson-Houston Co. (Ltd.). London. Improvements in insulated electric conductors, and process of and apparatus for making the same. (W. S. Clark and G. H. Rupley, United States.)*

COMPANIES' MEETINGS AND REPORTS.

Eastern Telegraph Co. (Ltd.).

The fifty-sixth half-yearly ordinary general meeting was held yesterday (Thursday) under the presidency of the Marquis of Tweeddale, K.T.

The SECRETARY (Mr. George Draper) having read the notice calling the meeting,

The CHAIRMAN said: Gentlemen, I have to invite your approval of the report and accounts, but before putting the resolution, I will refer to some of the more important events during the past half-year. The gross revenue for the half-year amounted to £543,684, an increase of £50,160. Analysing the receipts from various sources we find there is an increase generally from the most important traffic centres, more especially from South Africa. India, however, again shows a decrease, as compared with the corresponding period of last year, of £3,500. The total ordinary expenses for the half-year amounted to £128,072, an increase of £5,511. When I had the pleasure of addressing you last January, you will no doubt remember that this increase in the expenses was fully entered into and anticipated, and you must be prepared for a gradual increase in the working expenses in future for reasons I shall refer to presently. The expenses attending repairs and renewals of cables amounted to £27,939, against £34,520, a decrease of £6,581. This is to a large extent due to the extra credit received on account of the hire of our ships by other companies and foreign governments. You will notice from the report that a further reduction from 4s. 9d. to 4s. per word in the tariff between Europe and the colonies of South and Western Australia and Tasmania came into operation on May 1 last, and that the agreement with these colonies provides for further reductions under certain conditions to a minimum of 2s. 6d. per word. Substantial reductions in the tariff between the contracting colonies and South Africa will also come into operation when the new cables between Durban and Perth are completed. It is also anticipated that further reductions in the tariff between Europe and the Cape will take place in accordance with an arrangement between this Company, Her Majesty's Government, and the Governments of Cape Colony, Natal, and others interested. Negotiations are also in progress for a reduction in the tariff between Europe and India. The delay is caused by the fact that various administrations interested in this tariff have, under the regulations of the International Telegraph Convention, to be first consulted. Application has been duly made in the proper quarter, but up to the present replies have not been received. This Company has, as far as its own line is concerned, given its consent to the reduction from 4s. to 2s. 6d. per word with a further reduction to 2s. under certain conditions. This Company is, therefore, in no way responsible for the delay in the reduction of the tariff between this country and India. The effect of these important reductions will doubtless be to increase the volume of traffic, but it must be remembered that we can only earn the same amount of revenue in the future as we have done in the past by performing a much greater amount of work. This, in its turn, necessitates a larger staff, and consequently an increase in the various expenses incidental thereto. Another and more important factor which these reductions in tariff bring in their train is the necessary additional outlay for new cables and the extra annual revenue charges attending such large items of expenditure as we have already made, and which we have still to make. The reduction of rates and increased cable capacity are so closely connected that, considering the enormous outlay involved in laying new cables, a reduction of rates must of necessity be done gradually and with the utmost discretion, as a considerable time must elapse before the traffic develops sufficiently to give a fair return on the additional expenditure. Whenever traffic has shown evident signs of expansion warranting a reduction being made, your Directors have always

Digitized by Google

been willing to consider the question, notwithstanding all that has been said to the contrary by those who criticise our actions, but who are not sufficiently acquainted with the complicated question of cable rates. Your Directors are consistently following a policy of sharing our prosperity with the telegraphing public, after providing a fair and reasonable return to our stockholders. We have now arrived at a position of which, I think, we may be justly proud, and I think it must be admitted by those who have watched the progress of this Company that its prosperity is the result of careful and judicious management; and it is only of late years that a financial position has been arrived at which makes it possible for us to undertake the heavy responsibility of expending large sums on new cables in view of further and more important reductions of rates. The charge has been frequently made against this Company that the amount distributed by way of dividend and the accumulation of our reserves are excessive, but considering the peculiar nature of our property, the amount distributed by way of dividend cannot fairly be held to be unreasonable. To properly appreciate the financial position of these companies the net return on the total capital should be taken into consideration. The amount distributed on the capital of this Company and the Eastern & South African Co., of which this company holds the whole of the share capital, is only a little under 5½ per cent.; it is exactly 5·43 per cent. With regard to the amount of our reserve funds, it is held by those responsible for the management that the business of submarine telegraphy can only be successfully conducted by adequate provision being made for depreciation, so that cables can be renewed as they wear out, and additional cables can be laid as required without creating heavy additions to the capital account. Your Directors are of opinion that it is only by consistently adhering to this policy that further and more important tariff reductions can be made. When we successfully established submarine telegraphic communication with Gibraltar, Malta, Egypt, India, and later on with South Africa, we had to rely on a single line of cables, but the appreciation of submarine telegraphy entirely altered the method of conducting the trade of the world. Governments, merchants, and the Press found it indispensable and relied upon it for rapid communication. In consequence, traffic developed, and this Company, in conjunction with the other associated companies, recognising the necessity for greater security against interruptions, immediately commenced to duplicate their cable system throughout, and, as traffic increased, triplicate and even quadruplicate cables were laid over certain sections. Since the early part of last year this Company alone has incurred the following liability for new cables: The Porthcurnow-Gibraltar-Malta and Alexandria sections, already laid, costing £442,000, and the Cape Town-St. Helena-Ascension and St. Vincent sections, already laid, costing about £840,000, or a total of £1,282,000. The St. Vincent-Madeira-Porthcurnow and the Durban-Mauritius sections, together with the Sierra Leone-Ascension cable, duplex apparatus, and the extra cost of replacing the old s.s. "John Pender" by a vessel of greater speed and carrying capacity, and other items, will bring the total expenditure lately incurred and to be incurred by this Company alone to over £2,500,000. In addition to what this Company has agreed to expend on new cables, the Eastern Extension Company has undertaken an expenditure of about £1,250,000, so that, exclusive of the Porthcurnow-Gibraltar-Malta-Alexandria cables already dealt with by this Company, the cost of the new route from Great Britain to the Cape and on to Australia, together with the Sierra Leone-Ascension cable, will involve an expenditure between the two companies of over £3,300,000. Since the beginning of last year up to the date of the present accounts we have been able to pay towards these new cables about £1,175,000. Of this amount we have charged to capital account for the Porthcurnow-Gibraltar and Malta sections £306,000, and to reserve fund on account of the Malta-Alexandria and the Cape St. Vincent sections £435,000. To enable us to meet the expenditure in connection with the new lines to South Africa and beyond, without large issues of fresh capital, we have borrowed from the reserve fund of the Eastern and South African Company considerable amounts from time to time. You are already aware that the whole of the share capital of the South African Company is held by this Company, and, by paying a moderate return on its ordinary shares, that company has been able to invest in high-class securities on account of its general and other reserve funds the sum of £567,000, in addition to the amount of £560,000 loaned to us. It is, of course, very necessary for the South African Company to provide substantial reserve funds against the depreciation of their cables and other contingencies. The total length of the South African Company's system at the present date is 9,072 miles. I think you may rest assured that your interest in the South African Company is a valuable one, and the manner in which the resources have been husbanded has proved of very considerable strength to this Company, and has been of great assistance towards carrying out the important projects we have in view. Your directors do not propose to issue any additional capital at the present time, as they are of opinion that it is more judicious to wait until the important extensions to Australia are further advanced before finally deciding how to deal with the cost of these new cables. The accounts presented to-day are for the twenty-eighth complete year of the existence of this Company, during which time wonderful developments have taken place in submarine telegraphy, and I think we hold a better position, both financially and from the point of view of efficiency, than we have done in any previous year.

I am glad to see so many familiar faces here to-day. Stockholders, however, must, in the ordinary course of things, alter from time to time, and it may interest those who have not heard it before if I give a short history of the progress we have made during the last 28 years. This Company was formed in 1872 by the amalgamation of the four original companies owning the cable between Great Britain and our Indian Empire. The most important places connected at that time by the main line were Gibraltar, Malta, Egypt, Aden and India. The length of our cables at that date was 8,376 miles; to-day it is 34,662 miles, an increase of 26,286 miles. The length of land lines owned and rented in 1872 was 937 miles; it is now 3,139 miles, an increase of 2,202 miles. Our capital in 1872 was £3,397,000; at the date of the accounts presented to-day, it stands at £7,262,098, an increase of £3,865,098. Our gross revenue was £376,922 in 1872; for last year it amounted to £1,018,634, an increase of £641,712. The percentage of total expenses to revenue, however, has increased from 25 per cent. in 1872 to about 33 per cent. for the present year—fully accounted for, I think, by the increase in our income. After making suitable provision for the general and other reserves, the amount distributed amongst the ordinary stockholders is at the same rate as it was in 1872, whereas the average rate during the whole period is exactly 6 per cent., and the average rate per cent. paid on the whole of the capital of this Company is only 5½ per cent. I mention this more particularly to show that, although we are paying a fair return to our stockholders, we are employing our surplus funds to give our customers the benefit of improved communication and reduction in tariff whenever it is practicable to do so. When this Company was formed in 1872 we owned two cable-repairing ships, but we can now find enough work for five in this Company and two in the South African Company. The number of stations and agencies in 1872 was about 15. At the present time we have 72 in various parts of the world, and the Eastern and South African Company have 13; a total of 85. Offshoots from our original main line have been made connecting Spain, Italy, Austria, Russia, Crete, Greece, Turkey, Cyprus, British and foreign Colonies on the East and West Coasts of Africa, and other places in South Africa, Seychelles and Mauritius.

Not very long ago investors in submarine telegraph undertakings were somewhat startled by the reports which appeared from time to time as to the possibilities of wireless telegraphy and the probability of its supplanting submarine cables. Without in any way discounting its usefulness under certain conditions, I do not think anything has transpired to alter the opinion which I expressed some time ago, that instead of becoming a rival to our system, it might possibly form a useful adjunct under certain circumstances.

You will notice that we have subscribed to the Transvaal War Fund, the City of London Imperial Volunteer Fund, and the Indian Famine Fund, and since the date of the report we have given an additional contribution of £500 to the Indian Famine Fund. We feel assured that the stockholders will approve of our action in these matters, seeing the close association of this Company with South Africa and India.

I have ventured to occupy your time at more than usual length this afternoon with a brief reference to the past as well as to the present condition of the Company, because this is the last time I shall have the honour of addressing you from the chair. Advancing years, together with the large increase in the business of the Company, render it most desirable that the chair should be filled by a younger man. We have, in the person of one of our directors, a gentleman who is, we consider, admirably fitted to occupy the place which I shall so soon vacate—I mean Sir John Wolfe Barry, whose distinguished career as an engineer and in other capacities points him out as one who will, in our opinion admirably fill the post of chairman. I am naturally glad to make this announcement at a time when the condition of the Company is so satisfactory, from every point of view, as I think I have been able to show it to be. After 28 years this state of things would not exist if you had not been served with the utmost zeal, and with unremitting attention to the business of the Company, both by your Directors and by the staff at home and abroad, and, let me add, if we had not enjoyed from first to last the confidence and unswerving support of our stockholders. I gladly avail myself of this opportunity to thank the staff individually and collectively, and I include, of course, our captains and their crews, for the admirable manner in which they have at all times and under all circumstances seconded the efforts of the Directors to provide a thoroughly efficient telegraph service for the public as well as a fair, though I myself personally consider a somewhat meagre, return for our stockholders on their investment. With these observations I beg to move:—

"*That the printed report and accounts of the Directors to March 31, 1900, submitted to this meeting, be and the same are hereby received and approved. That the dividend to be paid on the preference stock of the Company to June 30, 1900, at the rate of 3½ per cent. per annum, less income tax, be approved; and that, in accordance with the Directors' recommendation, a dividend be and is now declared of 1¼ per cent., with a bonus of ¾ per cent., both free of income tax, on the ordinary stock of the Company, making with previous payments by way of dividend on account a total payment of 7 per cent. on that stock for the year ended March 31, 1900.*"

Sir J. WOLFE BARRY: I beg to second the motion which has been proposed by the Chairman, and I think that I ought on this occasion to take the opportunity of expressing to his lordship my sincere acknowledgment of the kind way in which he has referred to me personally. The Directors have asked me to take the chair on its being vacated by Lord Tweeddale, and I am sure that in doing so I express their view as well as that of everyone else connected with the Company when I say that we shall deeply regret the absence of Lord Tweeddale's guidance in the future as Chairman, while looking forward with gratification to retaining the benefit of his advice on the direction of the Company. The noble lord has briefly drawn a very instructive and encouraging view of the prospects of the Company, and I will only say, for myself, that I have yielded to the unanimous wish of the Directors in accepting the post vacated by Lord Tweeddale, and that the position was none of my seeking; but I venture to put my services at the disposal of the Directors and of the Company, feeling that it is one of the most interesting and powerful companies in the whole world, and that the interests confided to me are not merely commercial, but are national in importance.

Mr. JOHN NEWTON said he did not think the resolution should be passed without an expression of feeling on the stockholders' side of the

Digitized by Google

table at the loss which the Company was going to sustain by the resignation of Lord Tweeddale from the position of Chairman. Of course this did not mean that the noble lord was going to leave the Company, of which he would continue to be a Director. Lord Tweeddale had been a member of the Board during the whole of the period the record of which he had placed before the meeting that day, and the Company had had the benefit of his advice during that period, as well as of the work done by his celebrated predecessor, the late Sir John Pender. They could not but feel extreme regret to hear that his lordship was not going to preside over any more of their general meetings, but it was very gratifying to know that they would continue to have the benefit of his services as a member of the Board, and that he would have a first-class successor. He could not but help feeling that the statement made to the meeting that day by Lord Tweeddale was to some extent a reply to the gross attacks which had been made on the property of the Eastern and the Eastern Extension Companies in the last few years by gentlemen who really ought not to talk so much until they knew something more about the actual work done by the companies. They were accused of being one of the most monstrous monopolies that existed, and yet, as they had just heard from the Chairman, the shareholders had received an average return of rather less than 5½ per cent on their investment, despite the enormous national services which had been rendered by their undertaking. In the last few days there had been a break in the communication between Shanghai and Taku, and it was regarded as a deplorable calamity that this bit of communication did not exist. Let them consider the enormous difference between that short bit of line and the whole of the system of this Company between this country and South Africa, and of the enormous value of the services rendered to the nation by this system; and yet this was just the time when they were being attacked as "gigantic monopolists," and other companies were proposed to be started, aided by the taxpayers' money, for the purpose of preventing the shareholders of this Company from enjoying the "tremendous return" which they had so far had on their investment. He regarded Lord Tweeddale's statement as unanswerable, and he had been extremely glad to hear it.

The motion was then carried unanimously.

A cordial vote of thanks was afterwards passed to the Chairman and Directors.

The CHAIRMAN, in reply, after recognising the extremely flattering manner in which the resolution had been proposed and seconded, said that he was also very much indebted to Mr. Newton for his kind remarks. He believed that that gentlemen had been present at their meetings ever since the establishment of the Company. Mr. Newton had been a free critic on many occasions, and he therefore thought that the stockholders might take that gentleman's remarks as representing fairly accurately the feelings of the stockholders generally towards the Chairman and the Board. The business of the Company was daily making greater demands on the Directors' attention, but he felt quite sure that under the presidency of Sir John Wolfe Barry the Company would continue to be successfully administered in the future as it had been in the past.

The proceedings then terminated.

Telegraph Construction & Maintenance Co. (Ltd.).

A half-yearly general meeting of this Company was held at the offices, on Tuesday, under the presidency of Sir R. G. W. HERBERT, G.C.B.

The SECRETARY (Mr. E. Dickens) having read the notice calling the meeting,

The CHAIRMAN said: As you are aware, there is no formal business to be transacted at this meeting, there are no resolutions to be carried, and there are no accounts to be rendered. These come at the other half of the year. We have, therefore, only a somewhat monotonous, but not on that account unacceptable, statement to make to you of the continued prosperity and industry of the Company. Our factories have been closely employed since we met you last, doing good work, and so have our ships. The new ship "Anglia," which we have mentioned to you several times as having been a very satisfactory acquisition, has lately completed one voyage and is about to enter upon another, laden with a greater amount of cable than has ever before been carried, as I understand, by any telegraph cable ship. On the occasion of her last voyage, as on every previous occasion, she gave the most perfect satisfaction to us in all ways, and she is a great strength to the Company. We have work in hand which will occupy us sufficiently well during the remainder of this year, and we do not anticipate that there will be any less favourable accounts to render to you when our annual meeting comes round than on the last and on several preceding occasions.

Mr. CROFT said there was one matter of absorbing interest to everyone at the present moment—he referred to the Pacific cable. Probably everyone had seen an advertisement in the papers with respect to tenders being asked for on behalf of that cable. He thought it would be satisfactory to the shareholders if the chairman were enabled to say whether the Company was in a favourable position as regarded tendering for that cable, or if he could give any other information to the shareholders. Of course he knew that there were matters which it was not advisable for the chairman to enter into very closely, but if it were possible to enlighten the shareholders on the point he had mentioned, he felt sure that it would be very satisfactory to them, having regard to the fact that many months must elapse before they would meet again in March.

The CHAIRMAN: With respect to the Pacific cable, Mr. Croft is right in saying that a notice has appeared in the papers that tenders were about to be called for. We have only just received the detailed specifications, and the Board has not had time to give that very close consideration to them which they must certainly receive. The proposals of the Government are that the work should be divided into sections—the long section from Vancouver to Fanning Island and the short sections from Fiji to Norfolk Island, Norfolk Island to New Zealand, and from Norfolk Island to Australia. Tenders may be offered for those sections. A company able to do the section from Vancouver to Fanning may, if it has the means in its establishment, be able to undertake other sections also. Whether we shall be able to offer to do this very exceptional work at prices which will satisfy the Australian colonies and Canada that they ought to incur the expenditure we cannot say, but we are quite sure that no other institution has a better prospect of being able to do the work, both economically and soundly, than the Telegraph Construction and Maintenance Co. We shall give the matter our very closest attention, and it is not impossible that we may see our way to take some part in the enterprise.

Mr. CROFT proposed a vote of thanks to the chairman, which was carried by acclamation, and the proceedings terminated.

Direct United States Cable Co. (Ltd.).

The report of the directors for the six months ended July 30 states that the half-year's revenue, after deducting out-payments, amounted to £52,204. 8s. 7d., compared with £51,951. 8s. 2d. for the corresponding period of 1899, an increase of £253. 0s. 5d. The working and other expenses for the same period, including income tax, amounted to £20,506. 8s. 10d., leaving £31,679. 19s. 9d. as net profit, making, with £6,347. 8s. 9d. brought forward, £38,045. 8s. 6d. For the corresponding period of 1899 the working expenses and other payments amounted to £20,411. 8d. 1d. Three quarterly interim dividends of 3s. each per share, amounting to £27.319. 10s. have been declared and paid during the financial year, and a final dividend of 3s. per share is now proposed, together with a bonus of 2s. per share, making 3½ per cent. for the year (absorbing £42,497).

After transferring £10,000 to reserve, the balance of £3,761. 8s. 6d. is proposed to be carried forward. The reserve fund account having been credited with interest on investments, realised profit, proceeds of sale, &c., of property at Torbay, Nova Scotia, and the sum now transferred from revenue, amounts to £418,875. 5s. 9d., taking investments at cost price.

Anglo-American Telegraph Co. (Ltd.)

The report of the directors states that the total receipts from Jan. 1 to June 30, including £1,355. 2s. 11d. brought forward, amounted to £186,526. 8s. 11d. The traffic receipts show an increase of £982 compared with the half-year ended June 30, 1899. The total expenses of the half-year, including repair of cables, &c., amounted to £60,784. 1s. 4d, a decrease of £243. 2s. 11d. compared with the corresponding period of 1899. The directors have, before declaring the net profits, set aside £12,000 for renewal fund, leaving £113,742. 7s. 7d.

One quarterly interim dividend of 15s. per cent. on the ordinary, and of £1. 10s. per cent. on the preferred stock was paid on May 1, absorbing £52,500, and a second quarterly dividend of 15s. per cent. on the ordinary and £1. 10s. per cent. on the preferred stock, absorbing £52,500 will be paid on Aug. 1. The balance of £8,742. 7s. 7d. will be carried forward.

The cables and land lines of the company are in good working order.

National Telephone Co. (Ltd.)

The report of the directors for the half-year ended June 30, states that the income of the half-year amounts to £700,140. 11s., compared with £602,640. 3s. 2d. for the corresponding period of 1899, an increase of £97,500. 7s. 10d. The working expenses (including special expenditure of £25,013. 3s. 8d. in repairing the damage caused by the snowstorm in February last) amount to £404,520. 13s. 8d., compared with £327,497. 18s., an increase of £77,022. 15s. 8d. The net result for the half-year (after deducting Post Office royalties amounting to £68,357. 9s. 7d.) is a profit balance of £227,262 7s. 9d., compared with £216,257. 6s. 7d. for the corresponding period of 1899, an increase of £11,005. 1s. 2d. The rentals carried forward for unexpired terms of running contracts amount to £733,614. 16s. 5d., compared with £651,741. 5s., an increase of £81,873. 11s. 5d. Out of the available balance of £178,195. 9s. 1d. the board recommend the payment for the half-year of a dividend at the rate of 6 per cent. per annum, less tax, on the First and Second preference shares, 5 per cent. per annum, less tax, on the Third preference shares, and 6 per cent. per annum, less tax, on the ordinary shares. The board further propose to transfer £55,000 to reserve, and to carry forward £4,325. 9s. 1d. £366,223. 16s. 9d. has been expended on capital account during the half year in the erection of 11,696 additional exchange and private lines, and in the construction of underground lines. The directors state that in considering the profit results of the half-year's working, it must be remembered that they have been very adversely affected by two exceptional causes: First, the large amount of £25,013. 3s. 8d. to repair the damage arising from the snowstorm in February, and second, the considerable increase in the cost of materials and labour consequent upon the abnormal commercial activity existing throughout the country.

BRITISH CONTINENTAL ELECTRICITY CO. (LTD.)—The ordinary general meeting of this company was held on Friday last. The directors' report stated that during the year at the San Remo works 67 applications were received for electric current, while the equivalent number of 8 c.p. lamps added was 3,189, against 2,150 for the preceding year. The gross receipts from sale of current show an increase of 70 per cent. over those of last year, and the net receipts increased from £191. 6s. to £805. 2s. 6d. Owing to the price of coal, the working expenses were again exceptionally heavy. After setting aside £33. 1s. 8d. as depreciation, making a reserve of £20 for bad debts, and writing off £60 from preliminary expenses, the balance standing to credit of revenue was £805. 2s. 6d., out of which £227. 5s. 9d. has been employed in the payment of interim dividend at the rate of 5½ per cent. per annum on the cumulative preference shares, leaving £577. 16s. 9d. to be dealt with, which the directors recommended

Digitized by Google

should be appropriated to a dividend at rate of 2¾ per cent. per annum on the cumulative preference shares for the six months to April 30, 1899; a dividend at rate of 5½ per cent. per annum on the cumulative preference shares for the past half-year, making the full dividend for the year; a dividend at the rate of 2 per cent. per annum for the past half-year on the ordinary shares, leaving £139. 13s. to be carried forward. £857. 0s. 5d. was spent on capital account during the year, in addition to a deposit of £330. 3s. 4d. on new machinery ordered for next season. The report was adopted.

CALCUTTA TRAMWAYS CO. (LTD.)—At the meeting on Tuesday the chairman (Mr. E. C. Morgan) said the company lost no time in getting forward with the necessary surveys and plans for the conversion of the lines to electric traction, and they had now entered into a contract with Messrs. Dick, Kerr & Co. for the completion of the work by Dec. 31, 1901, at a cost not to exceed £170,000. The preliminary contract was based upon net cost of materials and labour, plus 10 per cent., which was to include engineering charges, and was not to exceed £170,000 as a maximum, whereas if it is found that the net cost of the materials and labour should prove less than the estimates, the reduction will be for the benefit of the company. That was, he thought, a satisfactory arrangement, particularly under the present conditions of the electrical industry. The doubling of the line across the Maidan to the docks, which is also to be equipped electrically, was now almost complete, and had been found to afford the greatest convenience to the public. Messrs. Dick, Kerr & Co.'s contract covers the electrical equipment of this line as well as that of all the other lines existing within the municipal boundaries, but it does not cover the cost of erecting the power-house and the alteration of the car sheds for the reception of the motor cars. That work was now being prosecuted by their own staff, and would be vigorously pushed forward so that all might be in readiness for the reception of the engines, boilers, and dynamos, which were in course of construction, and which would be forwarded to Calcutta with the least possible delay. In order to provide the necessary funds the directors had created an issue of first debenture stock for £350,000, and had offered £250,000 for public subscription in March last. The response to this invitation was very satisfactory, and they were now in ample funds. The company's relations with the authorities in Calcutta have undergone a complete revolution, and they were now on excellent terms. The company had been approached regarding the construction of extensions, which might prove of the highest advantage, especially in bringing the suburbs into communication with the centre of the town, and by rendering the transport within the town itself swift and easy. Any great expansion in the receipts could not be looked for until they had mechanical power, for it was impossible for them to greatly increase their mileage without an increased number of horses; but it was satisfactory to know that their traffics increased in direct ratio to the mileage run, showing not only that the service continued as popular as ever, but that there was an unlimited demand for riding accommodation the moment it could be supplied. With electrical energy there was practically no limit to their ability to supply accommodation.

SOUTH STAFFORDSHIRE TRAMWAYS CO. (LTD.)—At the meeting oe this company on Tuesday the chairman (Mr. W. S. L. Schuster) said thd total receipts had increased by £2,023. 4s. 8d., but the total expenses hay increased by £2,885. 7s. 3d., which was largely caused by the enormously enhanced prices of materials. As a result of the year's operations thef were left with £922. 12s. 11d. available for distribution. The dividend o 2s. 5d. per share on the preference shares would absorb £918. 6s. 8d., leaving £4. 6s. 3d. to be carried forward. The terms of the agreement entered into with the lessee company during the year were the best which the directors could possibly obtain. The agreement secured them a minimum rent of £4,500 a year, which became reducible as the local authorities purchased the various sections of the line. Then there was a sliding scale of so much a mile run over a certain mileage. There were important provisions with regard to re-equipment, the object being that the lessee company should have the right to re-equip those portions of the line which were now worked by steam with electricity, the tramway company to pay the cost of the re-equipment in debentures. The resolution for the adoption of the report and accounts was unanimously agreed to.

NEW COMPANIES, STATUTORY RETURNS, &c.

ALLEN & BARKER (LTD.).—This company was registered on July 10, with a capital of £7,500 in £1 shares, to carry on the business of electrical and general engineers, motor car manufacturers, &c. The first managing directors are G. P. Martin, W. Allen and L. C. Barker.

BROCKIE-PELL ARC LAMP (LTD.)—This company was registered on July 12, with a capital of £80,000 in £1 shares, to adopt an agreement with the Brockie-Pell Arc Lamp (Ltd.), incorporated in 1896, and to carry on the business of arc and incandescent lamp manufacturers, electrical and general engineers, suppliers of electric light and power, &c.

DARGUE ACETYLENE GAS CO. (LTD.)—This company was registered on June 26 with a capital of £6,000, in £1 shares, to acquire the business of the Dargue Acetylene Gas & Electrical Co. (Ltd.), and to carry on the business calcium carbide manufacturers and merchants, makers of electrical, gas and other appliances, suppliers of electricity for light, &c. The first directors are W. H. Dargue and H. A. Macfadyen.

JOHN DAVIS & SON (DERBY) (LTD.)—This company was registered on July 13, with a capital of £35,000 in £1 shares, to acquire the business carried on as John Davis & Son, and to carry on the business of manufacturers of mining, engineering, electrical and scientific apparatus, makers of miners' safety lamps wire drawers, manufacturers of electrical and other carriages, motors and accessories, suppliers of electricity, &c. The subscribers are H. Davis (engineer), L. W. de Grave (engineer), C. P. Stevenson, M. Attwood, W. H. Evans, J. A. Ashby (electrical engineer), and J. J. Barnett. The first directors are H. Davis (governing), L. W. de Grave, M. Attwood and C. P. Stevenson.

EGERTON AND CO. (LTD.)—This company was registered on June 8, with a capital of £3,000, in £1 shares, to carry on the business of electrical and general engineers, manufacturers of electrical apparatus, contractors, and suppliers of electricity for all purposes.

FAIRBAIRN-LAWSON-COMBE-BARBOUR (LTD.)—This company was registered on July 11, with a capital of £800,000, in £1 shares (300,000 preference), to acquire the businesses of Fairbairn, Naylor, Macpherson & Co. (Ltd.), S. Lawson & Sons, and Combe, Barbour & Combe, and to carry on the business of electrical and general engineers, metal founders, &c.

SANDYCROFT FOUNDRY CO. (LTD.)—This company was registered on July 4, with a capital of £32,000, in £1 shares, to take over the business of electrical and mechanical engineers, founders, &c., carried on by the Sandycroft Foundry & Engine Works Co. (Ltd.).

TAYLOR, TUNNICLIFF & CO. (1900) (LTD.)—This company was registered on July 9, with a capital of £100,000 in £1 shares (40,000 preference), to acquire the business carried on by Taylor, Tunnicliff & Co. (Ltd.) and to carry on the business of manufacturers of electrical appliances, &c.

R. WAYGOOD & CO. (LTD.).—This company was registered on June 28 with a capital of £210,000, in £1 shares (105,000 preference), to take over the business of R. Waygood & Co. (Ltd.) (in liquidation), and to carry on the business of lift machinery manufacturers, hydraulic, electrical and general engineers, &c. The first directors are H. C. Walker, W. R. Green, C. Day, E. P. Okeden, D. W. R. Green, and R. J. White.

J. G. WHITE & CO. (LTD.)—This company was registered on July 10, with a capital of £100,000 in 5,000 £10 preference shares and £50,000 £1 ordinary shares, to carry on the business of railway, tramway and telegraph proprietors, electrical and general engineers, &c., and to enter into an agreement with J. G. White & Co., of New York. The subscribers are J. G. White (electrical engineer) (500 shares) and A. H. P. Stoneham P. H. Baldwin (engineer), E. B. Wyman, W. C. Burton, C. Wren and A. N. Connett (engineer) (with 100 shares each).

CUBA SUBMARINE TELEGRAPH CO. (LTD.)—The annual return to May 23 gives the capital as £220,000, in 16,000 ordinary and 6,000 preference shares of £10 each, all of which have been taken up and paid for in full.

ELECTRIC TRACTION CO. (LTD.)—According to the annual return to May 10 the capital is £300,000 in 1,200 shares of £1 each, and 29,830 shares of £10 each, all of which have been taken up. The full amount has been called up on each share, and £300,000 has been received.

WEST INDIA AND PANAMA TELEGRAPH CO. (LTD.)—The annual return to June 13 has been filed. The capital is £2,445,630 in 200,000 ordinary, 34,563 first preference and 10,000 second preference shares of £10 each, of which 88,321 ordinary, 34,563 first preference, and 4,669 second preference have been taken up. £10 has been called up on each share and £1,275,530 has been received.

CITY NOTES.

MEMORANDA.—Bank rate 4 per cent. (July 19, 1900). Price of silver 28 3/16d. per oz. (July 19). Consols (2¾ per cent.) 97 1/16—97 1/16 for money, 97⅞—98 for account; 2½ per cent. 97¼—97¾ (July 19). Stock Exchange Settling Day: Consols, Aug. 2; Stocks and Shares Continuation Days, July 25 and Aug. 13; Ticket Days, July 26 and Aug. 14; Pay Days, July 27 and Aug. 15; Mining Share Carry-over Days, July 24 and Aug. 11.

BRITISH COLUMBIA ELECTRIC RAILWAY CO. (LTD.)—The directors' report for the year ended March 31 states that the net earnings amounted to £40,512, against £33,238 last year. The ratio of working expenses to gross earnings has fallen by 4·18 per cent., which, on last year's earnings, would represent a saving of £3,554. The net profit, after deducting London office expenses, amounts to £38,216, besides the balance forward, £189. After payment of debenture interest (£11,250), preference share interest (£6,028), interim dividend on ordinary shares (£4,000), there remains for distribution £17,127. A further 20 per cent. is written off preliminary expenses (£1,218), a final dividend is proposed on ordinary shares of 2 per cent., making 4 per cent. for the year (£4,276), £500 is transferred to general reserve (now £12,500), £5,500 is devoted to capital amortisation, and £5,500 to reserve for depreciation, and £132 is carried forward. The directors recently made a further issue of 1,600 5 per cent. non-cumulative preference shares of £10 each.

BRITISH INSULATED WIRE CO. (LTD.)—Dividend warrants on the 6 per cent. preference shares for the half-year ended June 30 have been posted.

BUENOS AYRES GRAND NATIONAL TRAMWAYS CO.—The chairman announced at the general meeting on Monday that the directors were strongly opposed, at the present time at all events, to any attempt to alter their mode of traction. It might be found as time went on that they were wrong, and that electric traction in Buenos Ayres was the right thing, but he had "grave doots."

CASTNER ELECTROLYTIC ALKALI CO. (U.S.A.)—On behalf of this company the Castner-Kellner Alkali Co. has invited subscriptions for £150,000 5 per cent. first mortgage sterling debentures of £100.

CITY OF LONDON ELECTRIC LIGHTING CO. (LTD.).—Mr. Joseph Bevan Braithwaite, jun., of 27, Austin Friars, E.C., and Mr. Herbert Samuel

Digitized by Google

Leon, J.P., of Bletchley Park, Bletchley, Bucks, have been elected directors of this company. The transfer books and share register of the 6 per cent. cumulative preference shares are closed from 19th inst. to Aug. 2 inclusive.

CITY & SOUTH LONDON RAILWAY CO. (LTD.)—The directors announce that the accounts for the half-year ended 30th ult. show a balance, after providing for debenture interest, the full dividend on the 5 per cent. preference stock "1891," and on the 5 per cent. preference stock "1896" (less two months' dividend paid out of capital of latter), sufficient to allow a dividend on the consolidated ordinary stock at the rate of 1¼ per cent. per annum (against 2¼ per cent. last year) and to carry forward £788.

COVENTRY GAS FITTINGS, ELECTRIC & ENGINEERING CO. (LTD.)—The directors' report for the year ended 31st March states that, notwithstanding the opening of branches mentioned in last year's report, the turnover was still £10,000 below that of 1898. The net result of the year's trading was a loss of £948, which, with the adverse balance from last year, has been deducted from revenue account, now standing at £1,172.

EASTERN EXTENSION, AUSTRALASIA & CHINA TELEGRAPH CO. (LTD.)—Interest on this company's 4 per cent. mortgage debenture stock for the half-year to July 31 will be paid by warrant on Aug. 1. The register of this stock will be closed from 27th to 31st inst. inclusive.

EDISON & SWAN UNITED ELECTRIC LIGHT CO. (LTD.)—The directors recommend payment of a dividend in respect of the six months ended June 30 at the rate of 6 per cent. per annum on the "A" shares as now paid up, making, with the interim dividend at the same rate paid in February, 6 per cent. for the year. Dividend warrants will be posted on 31st inst.

ELEKTRICITATS AKTIENGESELLSCHAFT vorm. SCHUCKERT & CO.—The profit for the year ended March 31 was £462,451, and a dividend of 15 per cent., the same as last year, has been declared.

STOCK EXCHANGE NOTICES.—26th inst. has been appointed a special settling day in £70,000 4½ per cent. debenture stock of the *Bournemouth and Poole Electricity Co.* (*Ltd.*), and the stock has also been ordered to be quoted in the official list. Application has been made to the committee to appoint a special settling day in, and to grant a quotation to, the further issue of 20,000 5 per cent. cumulative preference £5 fully-paid shares of *Callender's Cable & Construction Co.* (*Ltd.*).

TAYLOR, TUNNICLIFF & CO. (1900) (LTD.)—This company, which has a nominal capital of £100,000 in 40,000 preference and 60,000 ordinary shares of £1 each, has invited subscriptions for 35,000 preference and 37,000 ordinary shares.

NOTES.

MR. RITCHIE, President of the Board of Trade, received, on Tuesday, a representative deputation from the London electricity supply companies with regard to a most important matter. The existing Board of Trade Regulations "for securing the safety of the public" and "for ensuring a proper and sufficient supply of electrical energy" permit the maintenance of a pressure up to 250 volts within a consumer's premises instead of only 150 volts alternating or 300 volts continuous, which were the maximum limits before the revision of the regulations in 1896. The same rules also fix the permissible variation and define the meaning to be attached to the terms "low," "high," and "extra high" pressure, and we were able last November (*The Electrician*, Vol. XLIV., p. 31) to give an authoritative opinion as to the interpretation of certain ambiguities on these points.

THE 1896 regulations, although sanctioning a supply of alternating or continuous current on the three-wire system at 2 × 200 volts or slightly higher, contained a qualification which has prevented central station engineers from the full enjoyment of the new privilege. In laying down a new supply system, the engineer is free to adopt this pressure, and the consumer must accept or refuse the supply at the pressure offered to him so long as it is within the prescribed limits. But a system may only be changed over from 100 volts to 200 volts "provided that no change shall be made in the pressure of the supply to any premises which at the date of these regulations [1896] are supplied with energy by the undertakers except with the consent of the consumers" (see the second part of clause B6 in the existing Board of Trade regulations). It appears that some obstinate individuals, representing only a small proportion of the whole body of consumers on the mains of the various metropolitan companies, have withheld their consent to being supplied at 200 volts instead of 100 volts, and have thereby prevented a complete change-over of the system, for the companies are bound by statute to continue to supply them with electrical energy. Appeals have been made at various times, and with varying degrees of emphasis, but with no avail, and now the companies have done what they ought to have done long ago, and begged the Board of Trade to substitute for the last seven words of the objectionable sentence: "except on such terms and conditions as may be agreed upon between the undertakers and the consumers, or, failing agreement, as may be settled by an arbitrator appointed by the Board of Trade."

WE have pointed out on previous occasions that the employment of the higher supply pressure, now that efficient 200-volt lamps and apparatus are obtainable, is to the benefit of the consumer as well as the supplier; and it is disappointing that Prof. KENNEDY, who acted as chief spokesman for his colleagues, should not have been able to impress Mr. RITCHIE with the justice of his plea. When the notes and figures have been put in by the companies as to the relative importance of the "conscientious objectors," the capital expenditure involved, and the effect of this on the price of current to the consumers who are amenable to reason, perhaps the Board of Trade will be convinced. It would surprise us if their electrical adviser had not been convinced already.

THE description of some experiments by Prof. ERNEST WILSON in this week's issue raises an interesting point in connection with the excitation of polyphase rotatory converters. Using a two-phase bipolar machine with a smooth core armature and testing under conditions of constant frequency and potential at the slip rings, and maximum power factor for all loads, Prof. WILSON finds that as the load increases it is necessary slightly to decrease the excitation of the converter while at the same time increasing the excitation of the generator. The diminution in current required for the converter field is, however, very small, being only 2 per cent. with a rise of load from 0 kw. to 8½ kw. The remarkable point is that the results obtained with this two-phase machine are diametrically opposed to the results obtained by Messrs. PARSHALL and HOBART with a three-phase

Digitized by Google

rotatory converter run under the same conditions as to voltage, frequency and power factor. Messrs. PARSHALL and HOBART found, indeed, that the field excitation of the converter required to be increased as the load increased, the effect being most marked as the full load was more closely approached. It is by no means clear whether this radical difference in the results is due to the essential differences between three-phase and two-phase converters or whether it is the accident of the particular combinations of plant used in the two sets of experiment. We trust that Prof. WILSON will pursue the investigation further and arrive at a conclusion of a more general nature with regard to this important point in the regulation of polyphase sub-station plant.

THE exact determination of the elasticity of metals in the form of wires or thin rods is a matter of considerable importance both to electrical engineers and to physicists. Some time ago Mr. L. R. WILBERFORCE introduced an ingenious method of determining YOUNG's modulus from the observed longitudinal and angular vibrations of a load hung at the end of a helical spring composed of the metal to be tested. Knowing the moment of inertia of the mass forming the load, the modulus could, of course readily be determined. A simplification of WILBERFORCE's method has recently been introduced by Mr. G. F. C. SEARLE, of the Cavendish Laboratory. The essential difference between Mr. SEARLE's and Mr. WILBERFORCE's method is that, instead of a helix, a long, straight sample of the metal is tested, the upper end being rigidly clamped and the lower end loaded, as in the Wilberforce method. It is claimed that this method not only admits of simpler mathematical treatment, as regards the elasticity of the structure, but also lends itself to the testing of materials which cannot readily be made in the form of a helix.

AT the same time, however, we fear that Mr. SEARLE's modification suffers from one or two serious defects which are not to be found in the Wilberforce method as usually employed. In the first place a straight wire, unless very long, must be heavily loaded if the time of angular or longitudinal vibration is to be sufficiently lengthy to eliminate errors of observation, while the addition of a very heavy load is liable to strain the material, in parts at any rate, beyond the elastic limit. Moreover, when a straight rod or wire is subjected to torsion the distribution of stress over the section is much more uneven than in the case of a helix, the outer portions of the metal being heavily strained, while the inner portions are subjected to very little strain. In the case of materials having a low elastic limit, therefore, the adoption of SEARLE's method is liable to give misleading results. Mr. SEARLE admits, however, that neither his modification nor the original Wilberforce method really gives what is required by YOUNG's modulus of a test piece of material, owing to the almost inevitable lack of isotropy in a test piece of the size required for either method. Indeed, the methods serve rather to indicate lack of isotropy in the material than to give YOUNG's modulus for the theoretically perfect material. To engineers this may appear an advantage, since it gives the actual practical results; but pure physicists, we fear, would look at such discrepancies somewhat askance.

A CURIOUS ending was announced, in the Queen's Bench Division of the High Court of Justice last Tuesday, to the dispute between the National Telephone Co., the London County Council and the POSTMASTER-GENERAL with regard to underground wayleaves. It will be remembered that the Telephone Company, having failed to obtain sanction from the London County Council to lay its wires underground, applied for permission from several London vestries, the application in some instances being granted and wires being actually laid underground. The POSTMASTER-GENERAL in the meantime circularised all these vestries, warning them that he alone had the right to lay underground wires for telegraphic and telephonic purposes, and that he had not relegated any of his powers in this respect to the National Telephone Co. Litigation followed, the ATTORNEY-GENERAL seeking for an injunction to restrain the company from opening and breaking up the streets, and after a number of postponements it was announced on Tuesday that an agreement had been come to between the parties whereby the company consented to judgment with costs in favour of the Crown on every point. Thus it has been declared that the company exceeded their powers in laying underground wires in London unless by licence of the POSTMASTER-GENERAL, and an injunction has been granted restraining the company from doing so in the future. It is not clear whether the company expect anything as a *quid pro quo*. From the absence of specific reference to the matter at the National Telephone Co.'s meeting yesterday, however, it might be understood that the company had received nothing, but expected something. Mr. J. S. FORBES gave the meeting to understand that although the negotiations with the Post Office had come to nothing he could not imagine that the company would receive other than equitable treatment, but he did not make it clear whether he referred to this particular case or to the broad question of competition generally.

The Hookham and Thomson Meter Case.—The report of the directors of the British Thomson-Houston Co. announces that notice of appeal has been given in the action of Chamberlain and Hookham v. Bradford Corporation (British Thomson-Houston Co. third parties).

Obituary.—We regret to announce that Mr. Harris H. Eley, district manager of the National Telephone Co.'s Cumberland district, was killed while on his holidays at Kenilworth, near Leamington, on Monday afternoon, through the overturning of a motor car in which he was riding.

Personal.—The Lords of the Committee of Privy Council on Education in Scotland have appointed Mr. F. Grant Ogilvie, Principal of the Heriot-Watt College, Edinburgh, to be Director of the Museum of Science and Art, Edinburgh. The late Sir R. Murdoch Smith previously held this post.

Birmingham University.—Another munificient donation has been received to the funds of the Birmingham University: Sir James T. Chance has presented £50,000, subject to conditions to be arranged with the University Council. The endowment fund now amounts to about £400,000, and some £200,000 is still required to complete the endowments.

Central London Railway.—The Central London Railway will be opened to the public on Monday next. Trains will commence running from Shepherd's Bush at 5.15 a.m., and from the Bank at 5.20 a.m., stopping at all stations except Bond-street, the opening of which is temporarily deferred. The fares from 5.15 a.m. to 7.30 a.m. will be 2d. return any distance, and from 7.30 a.m. to 12 p.m. 2d. single any distance. Books of 24 single-journey tickets will be sold at all stations.

Telephony in Russia.—The telephone systems of St. Petersburg, Moscow, Warsaw, Odessa and Riga, at present owned by the Bell Telephone Company, will, from November 1st next, revert to the State, who, however, are prepared to let them to private undertakers. Either Russian or foreign firms are eligible, and offers should be sent to the Russian Postal Administration by August 15, O.S. (August 28), 1900. Particulars must be given as to the amount of capital the undertaker is prepared to invest, as to the constitution of the firm, and whether it has already worked other telephone systems or electrical undertakings.

Accidents on the Liverpool Tramways.—On Tuesday afternoon last two slight mishaps occurred on the Liverpool Corporation electric tramway system. The first was the snapping of a trolley wire at the junction of Dale-street and Byron-street, which resulted in throwing all the street traffic over this portion of the line out of gear for nearly an hour. At about the same time—viz., 2 o'clock—the trolley arm of a car in Renshaw-street jumped the wire, and coming in contact with the suspension wire of a street pole, the trolley head and its attachment were wrenched off, and remained suspended in mid air. No one was injured, however, and no very serious stoppage of the tramcar service seems to have occurred.

Boiler Explosion at the Crystal Palace District Electric Supply Co.'s Works.—A regretable boiler explosion occurred on Wednesday afternoon in the works of the Crystal Palace District Electric Supply Co. A boiler burst with a loud report and wrecked two large buildings, the force of the explosion being so great that the roofs were blown off and the walls and windows shattered. Five men were buried under the débris; one of them, W. J. Philbrook, was killed, and two others, F. Elliston and C. Barker, seriously injured, Elliston having since died. The other two men were also injured but less seriously. The explosion was followed by a fire in two adjoining buildings which was not extinguished without some trouble.

Thunderstorms.—Severe thunderstorms were experienced all over the country during the latter part of last week. At Darlaston the trolley wires were broken as the result of a violent storm, and falling on a passing vehicle, the shock overturned the horse, besides affecting the occupants of the vehicle. In other parts of the Black Country fires are reported as due to lightning, whilst a chapel was practically demolished at Bradley, near Bilston. Similar damage was done at Northampton, Leicester, Birmingham, where the School of Art was partly destroyed, East Anglia, Hampshire, and the Isle of Wight. At Nenagh, Tipperary, two men were killed by lightning, besides a good deal of valuable cattle. The damage caused by the heaviness of the hail appears to be very considerable, whilst the number of deaths due to lightning is numerous.

Ritchie's Telautograph.—We had an opportunity of inspecting on Monday a new writing and picture telegraph, the invention of Mr. Foster Ritchie. It differs from the majority of other picture telegraphs in the rapidity with which the sketch or message is transmitted, the pen on the receiving instrument moving as fast as an ordinary writer moves the pencil of the sending instrument. No skilled operator is required, and the transmitting pencil is moved by the writer of the message. We tested the instrument ourselves and found that, although the handwriting may be slightly distorted, its character is not changed, and a diagram sketched was faithfully reproduced. The instrument is so arranged that no impression is made on the receiving instrument when the pen is moved above the paper, a contact being made by the pressure of the pencil. The instrument will work on an ordinary metallic circuit line. Owing to the fact that the foreign patents are not fully secured we have been requested to postpone our description of the working parts of the instrument.

Wireless Telegraphy.—It is stated that wireless telegraph apparatus was sent with the British reinforcements which arrived at Tientsin at the end of last week.—During the French naval manœuvres off Cherbourg, communication was, it is said, maintained between vessels over 40 miles apart by means of wireless telegraphy. It will be remembered that the record at the British naval manœuvres last year was over 67 miles. On the other hand, one of the newspaper correspondents with the naval manœuvres this year reports that on one occasion communication had failed at a distance of 25 miles.—The daily papers state that the Marconi system of wireless telegraphy is to be established on the mail packets running between Dover and Ostend. This announcement has, however, been made on previous occasions, but up to the present no steps seem to have been taken towards fitting up the apparatus.

Paris "Metropolitain" Railway.—The first section of the "Metropolitain" Railway in Paris has at last been completed. Schemes for an underground railway in Paris were projected before electric traction was even considered as an economical possibility; but by the time it had finally been decided to build the line, electric motive power was evidently the only rational one to use. The line should have been completed in time for the opening of the Exhibition, but the first section from Vincennes to the Porte Maillot was only opened on Thursday last. The intermediate stations are at the Place de la Nation, Gare de Lyon, Bastille, Hôtel de Ville, Palais Royal, Champs Elyseés and Place de l'Etoile. The line will pass the Champs Elyseés entrance to the Exhibition, and will also facilitate access to the Vincennes section of the Exhibition. A mishap on the line has already been reported, although it does not appear to have been serious. The *Times* Paris correspondent states that on Sunday the electrical apparatus was out of order and "the train went for half a mile at a headlong pace without stopping at the station, causing a panic among the passengers." The train was brought to a standstill, however, without any accident. Presumably the occurrence was due to some failure in the controller.

Municipal Opposition to the Electric Power Bills.—The following extract from a letter by Mr. H. Seaton-Karr, M.P., to last Saturday's *Times* is instructive, and should be taken to heart by the municipal opponents of the electric power bills:—

It is satisfactory to think that the electric power bills have now passed their third reading in the House of Commons after a most exhaustive examination before a strong committee; but it is also worthy of note that this has been done in spite of all efforts of the Association of Municipal Corporations to the contrary. . . . That the opponents of the bills failed to go to a division on the second and third readings was due, not to want of effort on their part, but to the inherent weakness of their case in opposition, the temper of which may be judged from a remark overheard in the lobby that they rejoiced to have put the promoters to the heaviest possible expense.

But all municipal corporations must not be included in this category. The following is an extract from a letter I received a few days ago, unsolicited on my part, from the town clerk of the Lancashire borough I have the honour to represent in Parliament (St. Helens) in reference to the Lancashire Electric Power Bill. This borough has an electric lighting and traction installation of its own. He writes: "I understand opposition is to be offered to the third reading of the Lancashire Electric Power Bill. . . . I may say for your information that the St. Helens Corporation have all through felt that their interests were sufficiently safeguarded, and they would like to see the bill pass in its present state. The provisions relating to the protection of local authorities as to the streets are in the shape in which St. Helens influenced their being drawn." I quote this letter as evidence that some municipal authorities, at all events, are sufficiently alive to the great importance of cheap electricity to the industrial enterprise of this country, do not approve of a dog-in-the-manger policy, and duly recognise that the production of cheap electric power is a subject too great for their monopoly, and that this country is lamentably behind the rest of the world in such production.

For a parallel to the bigoted opposition in other quarters than the industrial borough I am proud to represent that has delayed the passing of these bills for at least a year, one must go back not only to the days of George Stephenson and Parliamentary opposition to his locomotive on the ground that it could be upset by a cow, or alternatively would poison the atmosphere with its smoke and drive all game out of the country, but even to the dark ages, when a Spanish monarch executed, as a wizard, the first inventor of a steamboat that ran against wind and tide.

CONTEMPORARY ELECTRICAL SCIENCE.

[Compiled by E. E. Fournier d'Albe.]

Change of Resistance by Magnetisation.—The influence of magnetisation upon the resistance of a wire has not yet been studied with the care which the importance of the subject demands. Electromagnetic theory cannot but be greatly affected by any facts which are elicited, and the influence of changes in the earth's magnetic field upon magnetic conductors may be of some practical interest. Results attained in the case of bismuth would seem to indicate that there is no connection between magnetisation and change of resistance. But A. Gray and E. Taylor Jones have been led to the opposite conclusion by the results of some experiments on soft iron wires. They determined simultaneous values of the magnetising force, the magnetisation, and the resistance. To equalise the heating effects, they wound two identical lengths of the same wire on the same core, one longitudinally and the other transversely, and inserted the compound coil in the interior of a magnetising coil. The transverse coil was of course only very feebly magnetised. Both wires were traversed by the same current, but the longitudinal coil always showed the greater increase of resistance, the difference between the two fractional increments being about 3×10^{-4} in a field of 30 units, and 15×10^{-4} in a field of 300 units. The change of resistance appears to be proportional to the fourth power of the intensity of magnetisation.

[Gray and Jones, *Proc. Roy. Soc.*, June 21, 1900.]

Electric Properties of Different Glasses.—A. Gray and J. J. Dobbie have continued their researches on the effect of chemical composition upon the electrical properties of glass. That this effect can be very great is shown by a single case, in which the resistance of a lead-potash glass was reduced 130 times by substituting soda for the potash. Barium glasses have very peculiar properties. A glass manufactured by Schott, of Jena, and composed mainly of barium, oxide and alumina in combination with silica and boron trioxide, has a very high resistance, one quite unmeasureable, indeed, within the range of temperatures commanded by the authors. Moreover, the inductive capacity in a plate of this glass is exceedingly low, and the glass shows little or no effects of dielectric polarisation. The authors thought that the barium might be the determining factor in the high resistance. But a barium-potash glass made by Powell & Sons showed comparatively a very low resistance, which is exceeded even by ordinary commercial lead glass. The effect of annealing glass is greatly to increase the resistance, often to three times its original value. An annealed lead-potash glass, containing 48 per cent. of silica and 41 per cent. of lead oxide had a specific resistance of over $29,000 \times 10^{10}$ ohms at 140deg., and a dielectric constant of 7·42. The resistances were studied by the method of flasks filled with mercury.

[Gray and Dobbie, *Proc. Roy. Soc.*, June 21, 1900.]

Ionic Conductivity of the Atmosphere.—Lenard's remarkable discovery that ultra-violet light is capable of imparting conductivity to a non-conducting gas is utilised by J. Elster and H. Geitel to account for the dissipation of the charge of an electroscope by ordinary air. Since the sun's rays contain ultra-violet light before they impinge upon the atmosphere this light must ionise the upper strata, and the ions produced will be gradually distributed through the whole of the atmosphere by diffusion and convection. Hence the air will contain stray ions of both signs, possibly differing in frequency with the altitude. It is these ions which gradually discharge a carefully insulated electroscope. This view is corroborated by the observation that a limited volume of air can be deprived of its conductivity by electrostatic force, all the ions being attracted to the surface of the body charged with the opposite kind of electricity and there discharged. This process is the quicker, the smaller the volume of air thus treated, *i.e.*, the smaller the number of stray ions. Particles of dust, smoke, or fog produce a retardation of discharge instead of an acceleration. On the summit of high mountains there is a more rapid discharge of negative than of positive electricity, probably owing to the retention of a large proportion of the positive ions in the higher strata.

[Elster and Geitel, *Ann. der Physik*, No. 7, 1900.]

Point Discharges.—E. Warburg has brought out the differences between positive and negative ionisation by keeping a point at a constant potential face to face with a large plate connected to earth, and arranging the supply from an influence machine in such a manner that the glow was confined to the immediate neighbourhood of the point. On employing very carefully purified nitrogen as a medium, he found that the current intensity obtained by charging the point to −3,810 volts was 200 times as great as that obtained with +5,180 volts. This enormous difference was reduced to a ratio of 4 : 1 by a slight admixture of oxygen. If we assume, with Thomson, that ionisation consists in splitting the atom into two parts, one of which, the negative ion, is very small, and has a great velocity, while the other is much larger and slower, it may easily happen that the negative nitrogen ions are considerably retarded by combining with stray oxygen atoms, while the positive ions would be much less affected in comparison. This is the author's idea of the effect of an admixture of oxygen as an impurity. In the transition from the brush to the glow discharge, the author noticed a sudden decrease of the potential gradient near a positively charged point, but not near a negatively charged point. He attributes this to greater ionic density in the former case.

[E. Warburg, *Ann. der Physik*, No. 6, 1900.]

Absorption and Ionisation.—Lenard showed in 1894 that cathode rays are absorbed by a gas in exact proportion to its density. Since the energy is probably all spent in ionising the gas it should follow that the ionisation is also proportional to the density. This has been verified by J. C. McLennan. He found an agreement between the ionisation in hydrogen at atmospheric pressure, and that in air at a pressure of 53mm. At these pressurs the two gases had the same density, and in both cases, therefore, according to Lenard's absorption law, the disposition of the rays, their actual intensities, and the amount of them absorbed from point to point in the ionising chamber were precisely the same. Under these conditions the equal ionisations obtained not only form a strong confirmation of Lenard's absorption law, but they also show that where equal absorption of cathode rays occurs, equal ionisation is produced. In order to test the conclusion more closely experiments were made with air, hydrogen, carbon dioxide, oxygen, nitrogen, and nitrous oxide, and in all cases it was found that, when these gases were reduced to the same density, the same ionisation was produced in them by rays of constant intensity. It follows, therefore, that an ionisation law exists exactly analogous to that of absorption—namely, that when cathode rays of a given strength pass through a gas, the number of ions produced per second in 1cc. depends only upon the density of the gas, and is independent of its chemical composition. From the results thus obtained, the author concludes that, when cathode rays are absorbed to any extent, the positive and negative ions produced by these absorbed rays are of a definite amount which bears a constant ratio to the quantity of the rays absorbed; that is to say, in order to ascertain the relative ionisations produced in any two gases by cathode rays of the same intensity, it is sufficient to determine the absorbing powers of the two gases for the same rays. In other words, the coefficients of ionisation are determined when the coefficients of absorption for the same gases are known. The author then deals with the ionisation in any particular gas under varying pressures. The inference is drawn that, under rays of constant intensity, the ionisation in a particular gas varies directly with the pressure.

[J. C. McLennan, *Proc. Roy. Soc.*, Abstract, July 9, 1900.]

The German Electro-Chemical Society.—The German Electro-Chemical Society is arranging to hold its seventh annual meeting at Zürich from August 5 to August 7. In addition to the reading of a number of papers, visits are to be paid to the Polytechnic and to the works of the Oerlikon Co.

THE PARIS EXHIBITION.—II.*

(BY OUR SPECIAL CORRESPONDENT.)

The administration of the Paris Exhibition had a difficult problem before it to decide in what manner electrical energy should be supplied for light and power. It was essential that the major portion of the exhibition lighting should be electric, although there would of necessity be samples of illumination by incandescent gas and alcohol and acetylene burners, and it was also evident that electric cables and motors should replace steam pipes or countershafting for the transmission of power to drive the various exhibits. But the authorities were loth to expend a large sum on boilers, engines, and plant, which were only to be used for a few months, and which would probably realise only a small fraction of their original cost when sold second hand. Besides, this plant would occupy a great deal of space which might otherwise have been allotted to exhibitors, for the total capacity of the generating plant for the service of the exhibition has amounted to over 20,000kw.

The exhibition authorities have therefore adopted the following plan: Exhibitors were invited to erect direct-coupled condensing engines and dynamos in the Electricity Palace, to serve the double purpose of generating current for the service of the exhibition, and of exhibiting samples of the most recent designs of the firms in question. Steam at a pressure of 10kg. per sq. cm. and condensing water is supplied free of charge to the engines, and in addition a sum is paid per horse-power towards the expenses of erection, and a further sum for every hour the set is running for the supply of current. These sums are fixed by the following sliding scales:—

Contribution towards Cost of Erection.

	Engine. fr.	Dynamo. fr.	Total. fr.
For every H.P. up to 1,000	9·95	4·08	14·03
Do. do. from 1,000 to 1,500	7·10	1·25	8·35
Do. do. over 1,500	5·20	0·95	6·15

Contribution towards Running Expenses,

per I.H.P.-hour, the I.H.P. being taken as the normal for which the machine has been accepted by the administration.

	Engine. fr.	Dynamo. fr.	Total. fr.
For every H.P. up to 1,000	0·00840	0·00707	0·01547
Do. do. between 1,000 and 1,500..	0·00382	0·00293	0·00675
Do. do. over 1,500	0·00288	0·00240	0·00528

In view of the delay that took place in starting the machinery, it is of interest to add that the contractors were to commence laying the foundations by October 15, 1899, and that the machines were to be erected and ready to run by March 15, 1900, allowing therefore a month for tests and alterations before the opening of the exhibition. If the machines were not ready to time, fines were to be levied upon the payments mentioned above, and if the plant was not ready by May 15, 1900, the exhibition authorities were entitled to consider the contract void. As a mater of fact, only a small proportion of the machines were ready at the last-mentioned date, but the fault hardly lay with the contractors, for everything in connection with the exhibition was belated, and they were unable to start the work of erection as soon as they desired. Thus the engineer representing one of the English firms informed me that he left England for Paris some time after his engine had been despatched. Not until six weeks after his arrival at Paris did the engine arrive outside the exhibition. Then the Easter holidays intervened, and the authorities had not yet delivered it to his stand; and finally, when the cases had come within the building, all had to be cleared away with a number of others before being opened, in order that the exhibition might not present too unhandsome an appearance to the President of the French Republic on April 15th; it having been considered more important to open the exhibition than the cases containing the exhibits. I regret to say that the three English sets were almost the last to be running, the first of these only being completed the first week in July. Possibly the English engineers were not as able as the French and Germans in coping with the barrier of red-tape which is opposed in France to every effort at what our American cousins term "hustling," and possibly they were not backed by the British Commission as energetically as the German firms have been by the German Commission.

But to return from this digression. Each generating set has its own switchboard, which is in telephonic communication with either the continuous current or alternating current switchboard of the exhibition engineering department. At the individual machine switchboards the pressure is kept constant, but only one circuit leaves from each of them. No regulating is done at the main switchboards, which form merely the connecting links between the machines and the circuits. The chief distributing areas into which the exhibition has been divided were shown by the shading on the map published in the last issue of *The Electrician* (Fig. 1). The main building on the Champs de Mars is supplied with continuous current on the three-wire system at 2 × 220 volts, both for lighting and power. These circuits require about 3,000 amperes at 500 volts delivered from the switchboard, the Château d'Eau alone requiring 1,400 amperes when fully illuminated but at a time when the galleries of the exhibition are closed and there is no great demand for motive power. Around the outside of this building is a single-phase alternating-current circuit at 2,200 volts. Each consumer has a transformer, transforming down to 110 volts, and there are also eight sub-stations, each containing a single transformer large enough to supply 60 public arc lamps. A similar arrangement is made in the three-phase area which extends from the Trocadero to the Eiffel tower (the tower itself has its own generating plant); the current is three-phase at 2,200 volts, each consumer has his three-phase transformer, and there are sub-stations for the public lighting. In this area 2,000kw. have been provided for, but is not yet all required. For the circuits in Old Paris, part of the Rue des Nations and the banks of the Seine, 800kw. are supplied at 3,000 volts three-phase. The Porte Monumentale at the Place de la Concorde entrance is a "bit of Cromarty" attached to the circuits lighting the Pont Alexandre and about a quarter of the Esplanade des Invalides; these are supplied at 110 volts three-phase transformed down from 5,000 volts. The remainder of the Esplanade des Invalides is supplied for lighting by three-phase current at 110 volts transformed down from 2,200 volts. Power in the Esplanade des Invalides is supplied by two converter sub-stations, one Thomson-Houston and one Alioth, the current received being two-phase at 2,200 volts and 42·5 ∿ per second, and the current distributed being at 500 volts continuous. This is the only example of two-phase transmission in the exhibition. Two other rotatory converters supply the Beaux Arts section between the Seine and the Champs Elysées. One is a Thomson-Houston machine at 25 ∽ per second, receiving three-phase current at 5,500 volts and distributing it at 500 volts continuous; the other distributes at the same pressure, but receives at 3,000 volts and 50 ∽ per second, also three-phase. These two rotatory converters run on alternate days, and have each to supply 20 circuits of 10 arcs each. With the exceptions already mentioned, the alternating current is practically all at 50 ∿ per second frequency. A few parts of the exhibition are supplied from the mains of one of the Paris supply companies.

Before proceeding to enumerate and describe the generating plant, a few notes as to the consumers' circuits may be added. The consumer is furnished with electrical energy for power purposes free of charge; only if he desires extra light for his exhibit is he furnished with a meter, and requested to pay for the energy supplied to his lamps. This being the arrangement, it is only natural that the consumer should have to do his own wiring, and he does do it—usually badly. The administration has not directed enough supervision to this department, and peculiarly enough, on the score of expense, as I was informed, has not put a locked fuse in every consumer's

* The first article appeared in *The Electrician* of July 20.

Digitized by Google

circuit. The consequence is that short-circuits are continually taking place; in fact, during the first two months that the exhibition was opened it happened several times a day that circuits were cut off by the circuit-breakers on the main switchboard. The consumers have also used shunt motors to a large extent, and these being in very few instances provided with switches to switch off automatically when supply is cut off, it is necessary to leave a circuit dead for 5min. whenever its circuit-breaker has acted, in order to give consumers time to switch off their motors to prevent the armatures being burnt up on resumption of supply, An example of another kind of the foolishness of consumers attracted my attention in Old Paris one evening. There the supply is by alternating current, as already stated, and the concert room, where concerts by the famous Colonne orchestra are held, is lit with arc lamps, which start humming in an irregular manner every now and then.

Another source of trouble has been damage to the cables, which has occurred during the laying, while the exhibits were being brought in. Thus several short circuits in the high-pressure feeders are reported to have interrupted the supply, and even the continuous-current mains have been giving trouble. The latter are for the most part ordinary lead-covered cables laid under the floor, with service joints which may best be described by saying that they are, of course, of a temporary nature, and only intended to serve during the few months the exhibition is open. A practical form of cable head is employed, however, for the main cables between the generators and the exhibits. It is a funnel-shaped piece of ebonite which is passed over the trimmed end of the cable, fastened to the lead, and then filled with paraffin wax, the end of the copper conductor with its lug for screwing on at back of the switchboard being all that appears above the wax. Another example of the want of care in some matters of detail is a distributing board on the gallery of the electricity building and within reach of everyone. It apparently has upon it the fuses and switches of a number of important branch circuits, and is not even protected by a cover, so that it is within the the power of any visitor, who is not frightened by the legend, "Appareils de service. Défense d'y Toucher," to switch off all the circuits and walk away. Some of the exhibitors have been complaining that no alternating current supply was available within the electricity buildings, and Messrs. Siemens & Halske have found it necessary to put in a motor-generator in order to obtain the alternating current required for some of their exhibits. In the electricity section it would have been only fair to give every exhibitor the choice of continuous and alternating current.

However, it does not do to be hypercritical, and the electricity department is blamed for far too much in connection with the exhibition. Their task has been a gigantic one, and they as well as the other departments have been affected by strikes and *force majeure* which would have been deemed sufficient excuse for any ordinary contractor on any ordinary job. The electrical department is served by an expert staff of engineers under M. R. V. Picon, who at my request kindly put one of his assistants at my disposition one afternoon. His help was most valuable to me in obtaining particulars of the general conditions governing the electrical supply in the exhibition and the arrangement of the different supply areas and circuits.

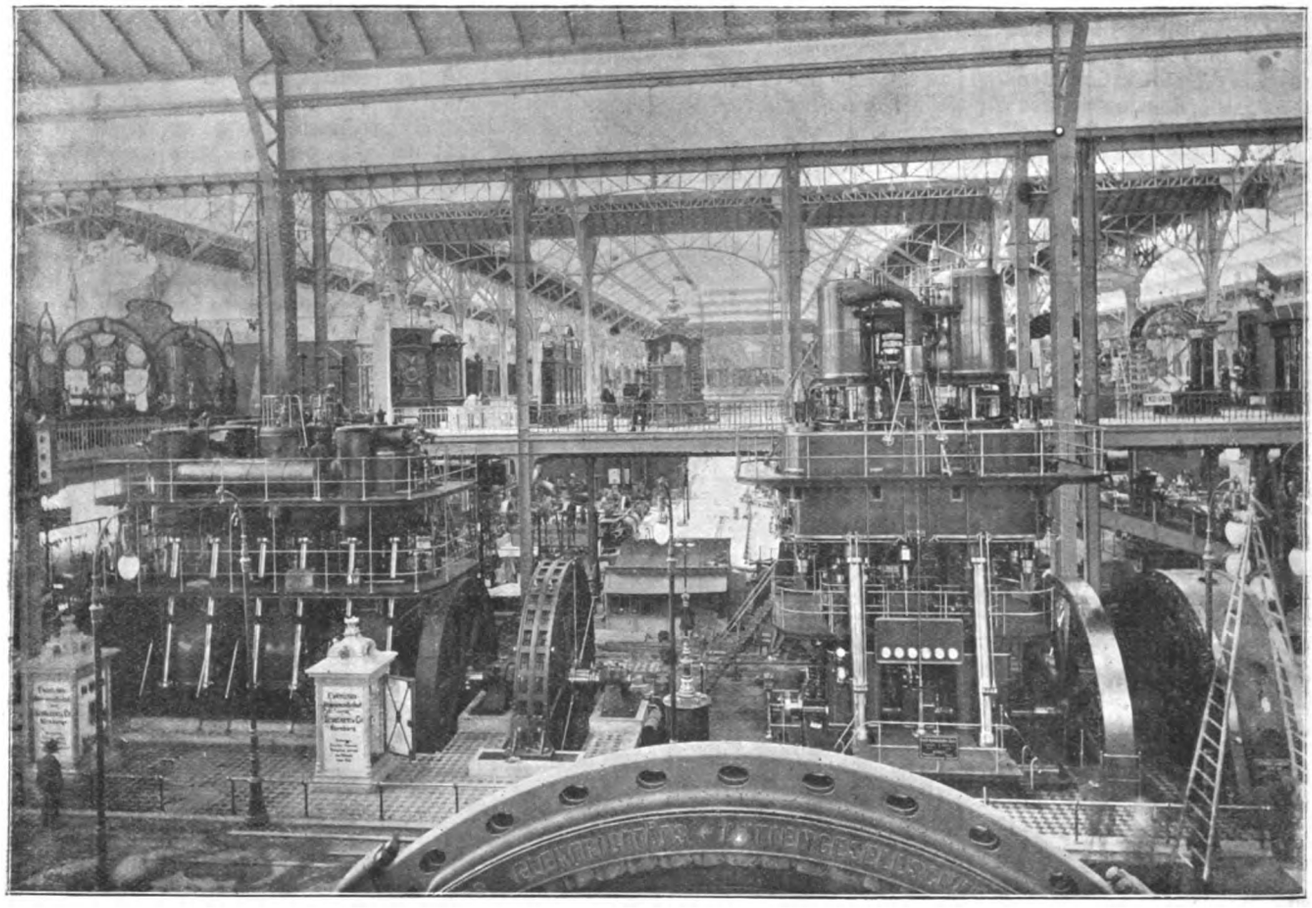

Fig. 7.—General View of Interior Electricity Building from Gallery.

The mechanical and electrical service are quite distinct, and under a separate staff of engineers. This makes it somewhat more difficult for the contractors, who have to obtain their steam from the mechanical department, and to supply current to the order of, and under conditions imposed by, the electrical department. However, the two departments pull well together, only unfortunately if there is a deficiency of steam or feed water, or if an alteration in the steam pipes delays the commencement of supply, it is always the electrical department that is blamed by the general public and the noisy Parisian press. An amusing example, on the other hand, of a difference between two departments occurred in connection with the symbolic figure of electricity surmounting the Palais de

l'Electricité. M. d'Arsonval had devised some fine high-pressure discharge effects which were to surround this figure, and add to the evening decorations of the façade already alluded to. For this purpose he employed a condenser charged by a high-pressure alternating current transformer. The transformer is of 30kw. size, and of the closed magnetic circuit type, and receives current at 110 volts or 55 volts, and 42·5 ∽ per second, transforming up to a maximum of 90,000 volts. The condenser is formed of plants of micanite, 2mm. thick and measuring 365 × 285mm., sandwiched between sheets of tin-plate, the micanite extending 5cm. over the edge of the metal, and the whole being plunged in petroleum. Twenty plates are used, and the capacity is about 0·01 microfarad. An ingenious discharger proposed for the purpose and already constructed by M. d'Arsonval in his laboratory, consisted of two metal spheres made to revolve in a circle in such a way that the current of air formed blows out the spark, and increases its length and noisiness, while if the speed of rotation is regulated so that the path moved through between two discharges is equal to the length of each spark, a continuous ring of fire is produced. As a spark up to 20cm. in length can be obtained by charging the condenser with 50,000 volts, and 600 discharges per second can be produced, 60 discharges can be seen in a tenth of a second, which gives the impression of a spark 1·20 metres in length. This discharger has not yet found its way to the top of the electricity building, because it still remains to be decided whether the duty of erecting and paying for it belongs to the electricity or the architect's department.

For 1fr. 50c. one can visit, between the hours of 10 a.m. and 7 p.m., the cellars beneath the Château d'Eau, in which the switches and drivers, arc lamps and projectors for the illumination of the Château and fountains are situated. A large part of the switchboards here was burnt down recently, the fire delaying considerably the first illumination of the water palace, and by the roughness of the wiring we should not be surprised to hear of a repetition of this occurrence. It is only fair to state that this work has not been done by the exhibition authorities, but by the Compagnie Générale de Constructions Electriques, who are the contractors for the illumination of the fountains. The wires are fastened against wooden boards, sometimes with iron staples, at other times

tied with tape tightly to sharp corners, and only occasionally on insulators fixed on rough wooden bases. Connections are also made with clips attached to bare wires, and the apparatus—the solenoids for moving the coloured glass in front of the arcs, the nickel-plated zinc mirrors, and even the dimmers and change-over switches for the different effects—show a serious lack of finish. The largest arc is a 75-ampere, with one pair of carbons, and the remainder 25-ampere.

For the supply of steam, boilers have been erected by a number of firms, half French, half foreign, on somewhat similar terms to the generating sets. On the preceding page is a list of them, and also of the generating plant. It should be explained that in the column headed "Power in kw," the figures represent only the number of kilowatts contracted for. In some cases, which will be mentioned when the individual machines are described, larger units have been put down in order to exhibit them. The machines are placed on the ground floor of the electricity building among the other exhibits, or perhaps it would be more correct to say that the other exhibits are grouped round these machines, for these generating sets are the most prominent. Fig. 7 is a view of the interior of the electricity building, taken from the end of the gallery above the German section. The top of the large Helios machine is seen, and the two other machines in the foreground are the Schuckert and Lahmeyer generators, both driven by Augsburg-Nuremberg engines. Views of the separate machines will be given in succeeding articles. This illustration merely gives an idea of the extent and general appearance of the electricity section. The next article will deal with the generating sets supplied by English firms.

SOUTHPORT COMBINED LIGHTING AND TRACTION SYSTEM.

The town of Southport faces the north-west, and can hardly be described accurately as a port. Although nominally on the Irish Sea, it is often more than a mile away, the intervening space, however, being filled with artificial sea lakes. Notwithstanding the odity of its name Southport has a Corporation which differs little from the corporations of the average northern town. It has had an electric lighting station running since 1891. It has now just combined it with a traction system using an overhead trolley, and it has a decided aversion to large electric power and tramway schemes promoted by companies, especially those proposing to establish themselves in southern Lancashire.

The lighting station originally contained three Mather & Platt dynamos driven by ropes from Browett-Lindley horizontal engines, the three sets aggregating only 250 H.P. These have given place to Musgrave-Ferranti direct-driven sets, the equipment of the station for lighting being now on the usual Ferranti lines. Current is generated at 2,000 volts pressure and transformed down to 100 and 200 volts, the former pressure being for a two-wire supply from sub-stations in various parts of the town, and the latter for outlying districts, the station itself being situated nearly two miles from the centre of the supply district. Although the lighting system is a single phase alternating one, and the tramways are run from a 500-volt continuous current supply, the Southport Corporation has been well advised in combining them in a single station. At present there is only one generating set for the tramway current, and it is, of course, an economy to run it from the same set of boilers and with the same staff of engineers as the lighting plant. An interesting feature

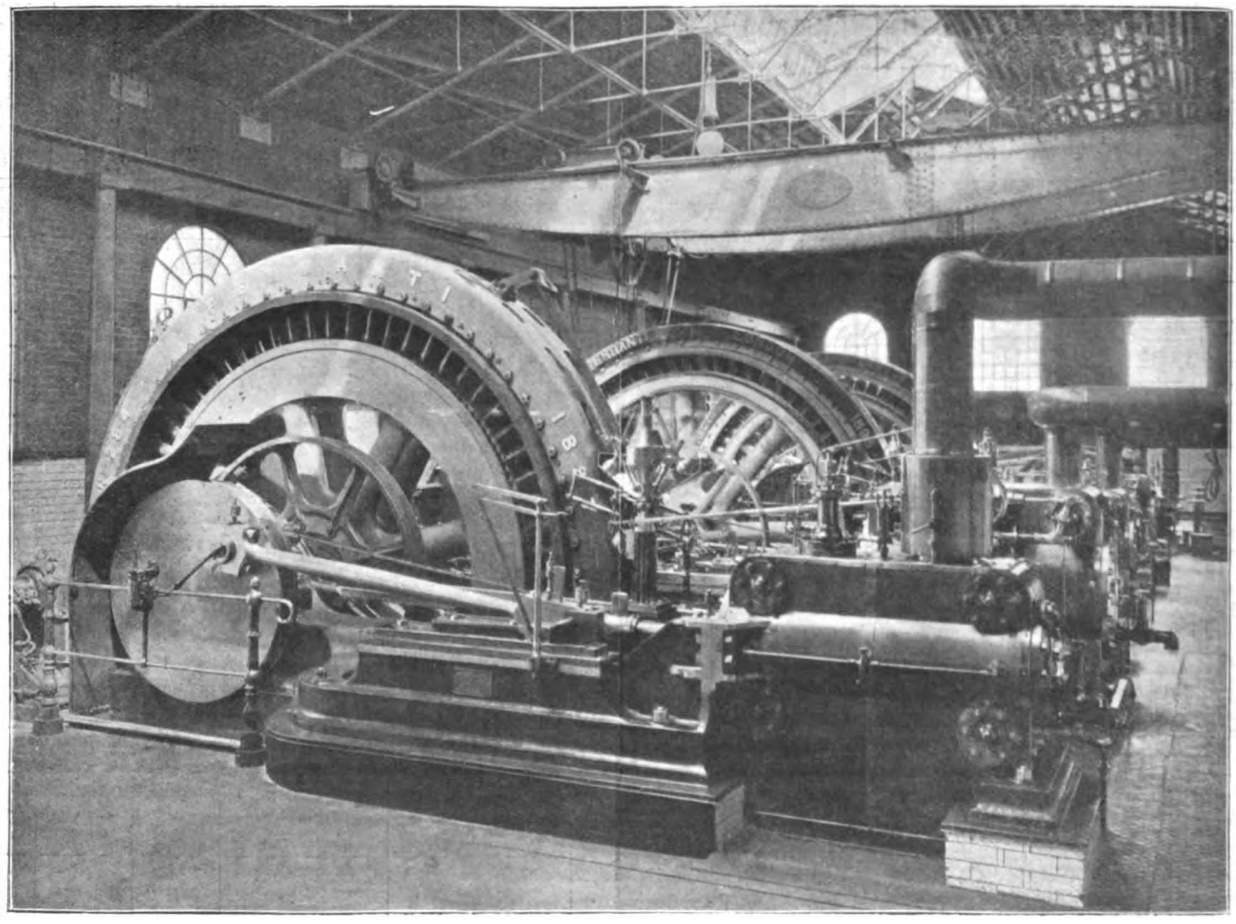

FIG. 1.—VIEW OF STATION, SHOWING FERRANTI SETS.

Digitized by Google

of the station is that a comparison can be made between the Ferranti revolving field type of alternator and that known as the "copper" or stationary field type. There are three of the former and one of the latter, the machines with the stationary field type having been the last to be erected. The first two machines erected were, by a peculiar coincidence, put down in 1895 and 1896 by Mr. Taite, the present borough electrical engineer, who was at that time with Messrs. Ferranti. They are rated at 250 H.P. (125 kw.), and, as seen in Fig. 1 are of the flywheel type and driven by cross compound Corliss condensing engines by Messrs. Musgrave & Co. The third machine was also erected by Mr. Taite, this time as borough electrical engineer to the Corporation of Southport during the great engineering strike of 1897, which, it will be remembered, affected Messrs. Ferranti's works. It is a 500 H.P. (300 kw.) machine, also driven by a Musgrave engine. The armature winding of this machine is composed of stranded copper insulated by a cotton covering and braiding, and is carried through the laminated iron core in micanite tubes, the end of the winding and connections being protected from damage and dirt by German silver boxes lined with ebonite. The armature is connected in series and is lap-wound. The laminated iron core itself is

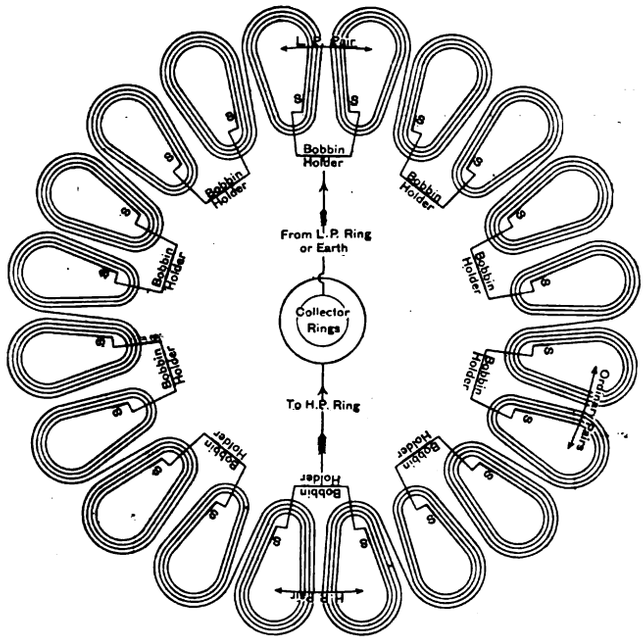

FIG. 2.—DIAGRAM OF FERRANTI "COPPER" ARMATURE.

built in sections which, with the winding and the protecting end boxes, can easily be removed and replaced by a complete spare section. The armature, as a whole, is securely held in a strong cast-iron frame, which rests on feet and is bolted to strong girders embedded in the concrete foundations. The field magnets are oval, and are fixed to the periphery of a cast-iron flywheel, and securely held in position by bolts passing through the rim. The field winding is of the usual form of copper strip wound on edge, and takes current from a small Parker exciter, driven by ropes off a pulley on the main shaft.

The following are the leading dimensions of the 1897 side-by-side horizontal Corliss engine, and particulars of tests made by Messrs. J. Musgrave at their works. Cylinder diameters: High pressure $17\frac{1}{32}$in, low-pressure $33\frac{1}{64}$in., not jacketted. Stroke of each cylinder 3ft. 6in. Piston rod diameters: high pressure $3\frac{3}{4}$in., low pressure 4in. Air pump: vertical, 25in. diameter, 12in. stroke. During the full-load trial the mean speed of the engine was 96 revs. per min., mean piston speed 672ft., and mean total I.H.P. 490·3. Mean boiler pressure 132lb. per sq. in. Mean vacuum in condenser 27in. 15lbs. of steam were supplied to the engine per I.H.P. per hour, and 1·81lbs. of coal were fired, the boilers being two in number, of the Lancashire type, each 28ft. by 7ft., hand fired and worked in connection with a Roberts economiser. Grate area 66 sq. ft. At the three-quarters load test the weight of steam supplied per I.H.P. per hour was 15·31lb., and the weight of coal fired ·861b. At one-half load the corresponding figures were 16lb. and 1·79lb.

The "copper" or revolving armature machine is built on the lines usually followed by Messrs. Ferranti in this type of generator, which, however, is not seen so frequently as the revolving field type. To remind our readers of the connection of the Ferranti armature we reproduce a diagram Fig. 2.

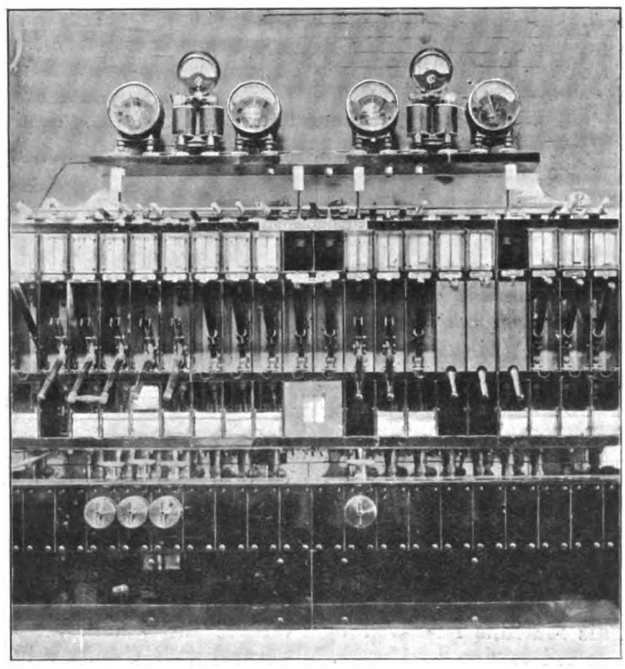

FIG. 3.—FERRANTI HIGH PRESSURE SWITCHBOARD.

The machine is designed to give 286 amperes at 2,100 volts, the frequency of course being the same as the other two machines—viz., 50 ∽ per second, and it is noteworthy that all the machines behave perfectly in parallel, the "iron" machines running quite harmoniously with the "copper" machine. The wheel on which the armature is mounted is

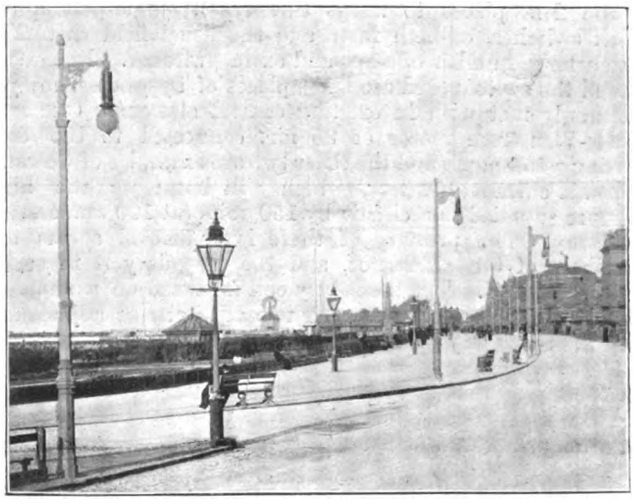

FIG. 4.—ARC LIGHTING ON PROMENADE.

made in one casting, and is of ample strength to withstand the stresses set up when running at 214 revs. per min. It is secured to the shaft in the usual way by mild steel rings shrunk over the bosses. As it is an "out end" combined plant, the shaft on which the wheel is mounted is separate from the crank shaft, but coupled to it by a solid forged flange, and is 15in. diameter in the swell, with journals measuring

Digitized by Google

10in. by 30in., supported by bearings lined with white-metal and lubricated by oil supplied under pressure from the under side of each bearing. The armature, consisting of 28 coils, is wound on cores built up in alternate layers of strips of brass and asbestos. It is of the usual form of Ferranti corrugated copper strip which ensures the winding being kept securely in position. Each pair of coils is firmly held between, but insulated from machined gun-metal holders which are rivetted together. Connected with bosses on these carriers are steel bolts, which, after passing through the outside of the wheel rim, screw into cast-iron blocks, which are themselves embedded in a special sulphur compound run into cored pockets in the the wheel rim. In order to secure good insulation, the bolts carrying the holders are covered with ebonite before being placed in position. The manner in which the armature is connected up in two parallel halves is clearly seen in Fig. 2.

The construction of the collector gear is simple and efficient, and the current, after passing down specially-insulated connections, is collected off a gun-metal ring which is carried by, but insulated from, the wheel boss.

On each side of the armature, allowing an air-gap of about $\frac{3}{8}$in., are ranged the 28 poles, which are fixed into bored holes in the cast-iron yoke which itself forms part of the massive frame. To facilitate easy adjustment of the air-gap and to reduce the friction in opening the two halves for purposes of cleaning or inspection, the feet of the frames are mounted on rollers.

The field winding is of the usual construction and composed of copper strip wound on edge around each pole. It receives the current from the armature of a rope-driven exciter. A special precaution against a flash-over from the armature to poles is taken by placing micanite caps on the faces, which also allows the air-gap to be made smaller than would otherwise be possible.

This machine is driven by a vertical three-crank tandem compound engine by Messrs. Musgrave, with Corliss valves, four to each cylinder, actuated in this case by a piston gear instead of by a trip gear. The speed of 214 revs. per min. is fairly high for this type of valve. The exciter is of the same type as on the other dynamos, and driven in the same way. It may be noted that each of the three parts of the engine is complete in itself, with its own jet condenser, so that in the case of one set of cylinders being disabled the machine may in certain circumstances still be kept running.

Fig. 3 is a view of the switchboard, which is of the standard Ferranti design, with edgewise ammeters (Southport being one of the first places to adopt this type), single-pole quick break switches, oil-bath fuses and the usual field rheostats, with a large number of stops and extra switches. In a room behind the switchboard are three pieces of apparatus not yet commonly met with in existing central stations. One is a Fuller-Wenstrom motor of 35 H.P. connected to the condensing water pump and the other two are examples of Cowan's alternate-current boosters, which will boost up the high pressure supplied to a circuit by 150 volts (at 100 amperes) if necessary. The primary of these is connected across the terminals of the alternator, and the secondary is in series with the circuit. The secondary coil is placed on a shaft so that the relative position of the two coils can be adjusted to vary the secondary pressure.

The arc lighting is by Ferranti rectifiers, there being in all 42 15-ampere arcs. There are two rectifiers, but each is capable of taking the full load of arc lamps. Fig. 4 shows the arc lighting on the promenade facing the sea.

(To be concluded.)

MAXIMUM POWER FACTOR AT CONSTANT VOLTS IN A TWO-PHASE ROTARY CONVERTER.

BY PROF. ERNEST WILSON.

It has been shown by Messrs. Parshall and Hobart,* that, if a three-phase rotary converter be run at constant frequency, with constant potential difference between its slip-rings at all loads and maximum power-factor at the slip-rings, the field excitation has to be *increased* as the converter is loaded. The effect mainly develops between half and full load. In the particular case alluded to, the excitation of the converter at full load is about 15 per cent. greater than it is when the converter is run unloaded.

The following experiments are addressed to testing this point in connection with a two-phase rotary converter. The machine experimented upon is of the bi-polar type with smooth core drum armature, and is intended to deliver 140 volts 80 amperes at 880 revs. per min., as a shunt-wound generator. It is fitted with four slip-rings which make contact with the commutator at 0deg., 90deg., 180deg. and 270deg., and receives current from a similar machine, also fitted with four slip-rings, and driven by a steam engine and leather link belt. The circuits between the slip-rings of generator and converter consist of four conductors (non-inductive) of resistance 0·054 ohms each, and the resistance of each armature between the brushes on the commutator is 0·042 ohms.† The machines were separately excited from a set of storage cells through adjustable resistances.

Three experiments have been made, and the results are given in the Table below. They correspond to about full load, half load, and the converter on open circuit. The results for the one-phase only are given: the other phase is the same but displaced one-quarter period in time. The method of experiment was to adjust the excitations of the generator and converter until the potential difference, as read on a Kelvin multicellular voltmeter placed across one phase at the slip-rings, was the same in each experiment for the same frequency and for maximum power factor. The curves of potential difference and current were observed by aid of a revolving contact maker and Kelvin quadrant electrometer in the usual manner. It will be seen from the table that the power factor is very nearly unity in each experiment. In experiments 1 and 2 respectively the curves of current and potential difference cross the axis of time at the same point. In experiment 3 the current curve leads about 9deg. The curves of potential difference in the respective experiments have the same wave-form, and the same remark applies to the curves of current. The generator excitation had to be increased as the load was increased; the converter excitation showed a diminution of about 2 per cent., as the load was increased from 0 to 8,240 watts. Further experiments might be made to see if the observed variation in the converter exciting current is connected with the mechanical phase displacement of the converter armature, and the phase of the alternate current; or if it is due to error in instrumentation. In either case the exciting current of the converter is substantially *constant* for all loads.

It may be mentioned that an exciting current of 3·2 amperes corresponds to a fairly high excitation in this machine, but not so high as when normally excited.

* See *Engineering*, April 20, 1900, Figs. 48, 49.

A FRICTIONLESS MOTOR METER.*

BY S. EVERSHED.

(Concluded from page 439.)

APPENDIX.—CALCULATION OF ARMATURE TORQUE, BRAKE TORQUE, AND FRICTIONAL RESISTANCE.

I. *Armature Torque.*

In designing an Ayrton-Perry motor meter the driving torque may be calculated from the formula—

$$d = HaNC/\pi,$$

which gives the torque d in terms of H the field of the main current coils, a the area of the average turn of wire on the armature, N the total number of turns in the armature winding, and C the whole pressure current from brush to brush.

A sufficiently close approximation to the true mean value of the field throughout the space occupied by the armature is obtained by calculating H at several points of the axis of the main coils, and taking an average. When the coils are rectangular, the field on the axial line may be deduced from the formula $H = 8C\sqrt{p^2+q^2}/pq$, which gives the field at the centre of a wire rectangle who sides are p and q. If the coil is square, this reduces to $H = 8\sqrt{2C/p}$, p being now the side of the square. The field at the centre of a circular wire being $H = 2\pi C/r$, we find that if $r = 0{\cdot}56\,p$ the circular and square wires will have the same field ; hence, for purposes of calculation, a circular coil of appropriate radius may be substituted for the square coil.

There are, of course, various methods for arriving at an exact value for H, but as they involve applications of spherical harmonics they are far too cumbersome for practical use in design.

When the meter is made, its driving torque is easily measured by passing a fine thread round the axle and hanging a known weight on the end. When the axle is vertical, the thread is brought out in a horizontal direction from the axle and passed over a freely pivotted pulley, from which it hangs down carrying the weight at its end. To avoid side pressure against the axle bearings it is desirable to use two threads brought away from the axle in opposite directions and each carrying half the weight, so that a proper turning moment is produced. Having adjusted the thread and weights, current is turned on, and varied until the armature torque just balances the weight. When the full-load torque is small, it is desirable to make this measurement with two or three times the full-load current, otherwise the weight required will be too small to enable accurate results to be obtained. The calculated torque is found to agree within 2 or 3 per cent. with that obtained directly by measurement.

II. *Brake Torque.*

The difficulty of determining the average path of the eddy current in a given brake conductor prevents us from predetermining the torque unless we have previously ascertained the effective electrical resistance of the current path in a brake of similar shape. There are, however, some general principles applying to the design of Foucault brakes which may be shortly stated here.

Consider a cylindrical conductor, of radius r, spinning on its axis between the poles of a magnet. Let the polar gap have a breadth b and axial length l, and let the field within the gap be H. Then if x is the electrical resistance of the current path, and ω the angular velocity of the cylinder, the current generated will be—

$$C = Hlr\omega/x$$

Now the force between conductor and magnet is HlC, hence the torque will be

$$M = H^2l^2r^2\omega/x \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (1)$$

When the cylinder extends axially for some distance beyond the poles in both directions, x becomes simply proportional to the resistance of the metal in the gap. Now this resistance is $\rho l/bt$, t being the thickness of the metal. We can therefore write $x = k\rho l/bt$.

The value of k depends on the shape of the polar area, and on the extent of conductor outside that area. The author finds k varies from about 3 for a square or circular area of gap up to 6 or 7 with oblong poles, even as high as 9 or 10 when there is very little metal beyond the poles. Inserting the value just given for x in equation (1) and multiplying both numerator and denominator by b, we get—

$$M = H^2t^2b^2r^2\omega t/k\rho bl,$$

$$M = B^2r^2\omega t/krbl \quad . \quad . \quad . \quad . \quad . \quad . \quad . \quad (2)$$

from which we see that for a given value of total induction B passing through the brake cylinder, the torque increases as the area bl is diminished. This deduction is well borne out in practice, and by giving the brake magnets conical poles ending in a circular gap of small diameter the torque for a given weight of magnet is considerably increased ; or, what is generally more important, for a given torque the weight of metal in the brake may be greatly reduced by using magnets with conical poles.

The formula also shows the advantage to be gained by increasing the diameter of a cylindrical brake ; since the weight only increases in simple proportion, while the torque increases in proportion to the square of the radius.

III. *Frictional Resistance.*

When mechanical friction is a fairly large percentage of the full-load torque, air friction may be safely neglected ; the only retarding forces are then mechanical friction, which is practically constant, and the brake, which is proportional to the speed. Hence if s_1 and s_2 are the observed speeds with two torques d_1 and d_2, we have—

$$d_1 = f + bs_1 \quad d_2 = f + bs_2,$$

where f is the torque required to overcome friction, and b is the brake torque at unit speed. Hence

$$b = d_2 - d_1/(s_2 - s_1), \text{ and } f = d_2s_1 - d_1s_2/(s_2 - s_1).$$

To get accurate results, stray fields must be eliminated by reversing the current in the main coils and taking a second set of readings with the same numerical values for d_1 and d_2.

In testing the friction of a "frictionless" meter, the greatest care is required in measuring speeds and torques, and it is necessary to reduce the strength of the brake to a small fraction of its normal value in order to obtain anything like accurate results, for obviously errors of observation have a rapidly increasing effect on the determination of f as the two quantities d_2s_1 and d_1s_2 approach each other in magnitude. Each of the results given in Tables III. and IV. is the mean of a number of observations, and to avoid effects due to want of truth in the brush wheels the speeds were deduced from the times taken to make 12 (and multiples of 12) revs. of the armature, corresponding with whole revolutions of the brush wheels. Even with the utmost care, discrepancies of as much as 10 or 15 per cent. in successive tests are quite usual when the friction is under 3 dyne cm.

When the armature and brake of a "frictionless" meter are both figures of revolution with smooth surfaces air friction is inappreciable up to speeds of 40 or 50 revs. per min., but when there are any parts attached to the axle which can have a fan action, air friction becomes evident, and although it would cause no appreciable error in the registration of the meter when the normal brake is in use, it will, if not taken into account, lead to an under-estimate of the mechanical friction. To avoid this, observations are made at three speeds in order to determine a, the coefficient of air friction, as well as f and b.

Thus, assuming the air friction of a rotating body to be proportional to the square of the speed, we have—

$$d_1 = f + bs_1 + as_1^2 ; \; d_2 = f + bs_2 + as_2^2 ; \; d_3 = f + bs_3 + as_3^2,$$

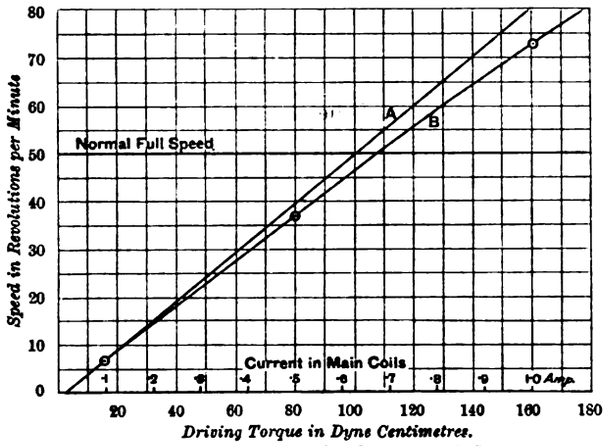
from which we first find a, then b, and finally the mean value of f.

$$a = \frac{(d_3 - d_2)(s_2 - s_1) - (d_2 - d_1)(s_3 - s_2)}{(s_3 - s_2)(s_3 - s_1)(s_2 - s_1)} ;$$

$$2b = \frac{d_3 - d_2}{s_3 - s_2} + \frac{d_2 - d_1}{s_2 - s_1} - a(s_3 + 2s_2 + s_1) ;$$

$$3f = d_3 + d_2 + d_1 - b(s_3 + s_2 + s_1) - a(s_3^2 + s_2^2 + s_1^2).$$

The air friction of a rotating body is probably not exactly proportional to the square of the speed, but the formula is found to agree very closely with experiment.



A. Curve drawn from equation $d = 3{\cdot}16 + 1{\cdot}96\,S$.
B. Curve drawn from equation $d = 3{\cdot}16 + 1{\cdot}95\,S + 0{\cdot}003\,S^2$.
⊙ Points determined by experiment.

FIG. 15.—Torque-speed Curves for Meter No. 5 (effect of air friction exaggerated by use of a weak brake).

An example of the effect of air friction is afforded by meter No. 5, in which each of the two parts of the astatic armature is made up of four oblong coils wound on open "formers." Such an arrangement naturally fans the air, and experiment showed that air friction at speeds of from 40 to 50 revs. per min. was by no means small compared with mechanical friction. The brake having been reduced to about one-sixteenth of its full strength the following readings of torque and speed were taken :—

Meter No. 5.

Full-load, 100 volts × 10 amperes.
Full-load torque, 1,610 dynes cm. ; drop 0·6 volt.
Effect of air friction exaggerated by use of a weak brake.

Volts.	Amperes.	d dyne cm.	s revs. per min.
100	0·10	16·1	6·58
100	0·50	80·5	37·40
100	1·00	161·0	72·60

By inserting these values in the above equations we find—

$$f = 3{\cdot}16 \; ; \; b = 1{\cdot}95 \; ; \; a = 0{\cdot}003.$$

The curve of the meter with its weakened brake is shown in Fig. 15, where the lower curve line is drawn to the equation—

$$d = 3{\cdot}16 + 1{\cdot}95\,s + 0{\cdot}003\,s^2,$$

* Paper read before the Institution of Electrical Engineers, May 10.

Digitized by Google

while the upper curve (a straight line) shows what the law of this meter would have been if no air friction existed. It will be seen that at 80 revs. per min. air friction amounts to as much as 19 dyne cm.

At full speed (50 revs. per min.) the driving torque is expended as follows :—

	dyne cm.
In overcoming mechanical friction	3·2
Ditto air friction	7·5
Ditto brake torque	97·8
	——108·5

That is to say, with the weak brake air friction amounts to about 7 per cent. of the whole resistance to rotation. With the brake restored to its normal strength the corresponding figures are—

	dyne cm.
Mechanical friction	3·2
Air friction	7·5
Brake (full strength)	1600·0
	——1610·7

It will be seen that the air friction is now less than one-half per cent. of the total resistance, although this particular meter has less torque than the standard now adopted.

Another method of determining friction, which seemed at first sight to offer several advantages, is to run the meter at about full load, and, having carefully determined the speed, at a given instant cut off the currents and note the time taken by the meter in coming to rest. If at any instant the angular velocity is ω, we have the equation—

$$I d\omega/dt = f + b\omega, \quad \ldots\ldots\ldots \quad (1)$$

where I is the moment of inertia of the meter axle and parts attached to it ; f is the mechanical friction as before, but b now stands for brake torque at unit *angular* velocity. (1) give the value—

$$t = \frac{I}{b}\int \frac{d\omega}{\frac{f}{b} + \omega},$$

hence

$$f = \frac{b\omega_1}{e^{\frac{tb}{I}} - 1}, \quad \ldots\ldots\ldots\ldots \quad (2)$$

ω_1 being the initial angular velocity. The moment of inertia is easily determined by attaching a hair-spring, of known strength, s, to the axle, and observing the period of oscillation τ ; then—

$$I = s\tau^2/4\pi^2.$$

s must be taken in dyne cm. per radian of torsion.

In practice this method has not given good results. A meter—especially a frictionless meter—comes to rest so gradually that it is exceedingly difficult to determine with exactness the instant when it stops. Again, if there is the least want of balance in the axle it will very rarely happen that the meter comes to rest at its position of stable equilibrium without first making one or more very slow oscillations about that point. Hence there are often very large discrepancies in successive observations, and on the whole the average time taken in coming to rest will be greater than it would be if the meter were perfectly balanced. Some early experiments with meter No. 2 may be quoted as an illustration of this uncertainty. Measured by the torque-speed curve the friction was 2·65 dyne cm. ; the mean of two fairly good observations of the time of stopping gave the value 2·98 dyne cm. This result being considered encouraging, a large number of similar tests were made, with the result that the average of the whole series gave 1·27 dyne cm. as the friction. This figure is undoubtedly a good deal lower than the true value, and, except as a rough and ready means of comparison, the stopping test has not since been employed. All the friction values given in the Paper are deduced from torque-speed curves.

An improvement on the stopping test would be to record on a chronograph the times of successive revolutions of the meter, beginning as soon as the currents are cut off and ending a little before the meter comes to rest. The chronograph record would enable a time-speed curve to be plotted, and the slope of the curve would give the total retardation, from which the brake torque would have, of course, to be deducted in order to arrive at the value of friction.

Calculated Friction.—It is useful to compare the value of friction given by direct experiment with the value calculated on the assumption that the bearings are the sole cause of friction. This comparison has been made in the case of meter No. 2, and shows a considerable margin of friction unaccounted for. If the diameter of contact between the steel point and the cup forming the step-bearing were measurable, the friction moment could be estimated from the formula—

$$f = kPd/3,$$

where k is the co-efficient of friction, P is the total pressure on the bearing and d is the diameter of contact.

It is, however, impossible to measure the contact diameter when the point and cup are spherical surfaces, and recourse was had to experiment. The total friction having been taken by the torque-speed method, a weight of about 50 grammes was added to the armature, and the friction again determined. The weight being removed, the first test was repeated. The result of these tests was to show that this particular point and jewel offered a frictional resistance of 0·092 dyne cm. per gramme weight pressing on the jewel. Now before the meter started running on Oct. 12, 1899, the pressure on the jewel was measured and found to be 12 grammes ; hence the step-bearing friction would be $0{\cdot}092 \times 12 = 1{\cdot}1$ dyne cm.

The friction added by each brush wheel is roughly as follows :—

Brush-wheel step bearing : pivot assumed to have a flat end in contact with flat step plate. Weight of wheel and its axle, 1·2 grammes ; or P = 1,200 dynes nearly enough. Diameter of contact, say equal to diameter of pivot, namely, 0·035cm. Co-efficient of friction 0·20. Then using the formula —

$$f = kPd/3,$$

we find the frictional resistance of the bearing is 2·8 dyne cm.

The commutator wires press against the wheels and force the brush pivots against the sides of the holes in which they run. The mean pressure on each wheel is about 50 dynes, and the radius of the pivot being 0·018cm., the friction moment is roughly $50 \times 0{\cdot}2 \times 0{\cdot}018 = 1{\cdot}8$ dyne cm. Adding this to the step friction and multiplying by two to include both brush wheels, we find they require a torque of nearly 6 dyne cm. applied to their own axles to overcome friction. This figure must of course be divided by 13—the ratio of the diameters of wheels and commutator—to give the frictional moment of the brush wheels upon the armature axle. That is to say, the brush wheels account for about 0·5 dyne cm., while the meter axle bearing accounts for 1·1, making a total of 1·6 dyne cm. estimated friction.

The lowest observed friction in meter No. 2 was 2·1 dyne cm. (see Table IV., Oct. 12, 1899), so that, remembering that brush-wheel friction is an over-estimate, there is at least 0·5 dyne cm. unaccounted for. No doubt the rolling of the commutator wires on the brush wheels accounts for some of this, and there is also the work done in overcoming cohesion as the wires pull themselves off the wheels. This is a form of work which is probably not completely or even at all reversible, so that it is not given back when the wires come into contact with the wheels. There may also be a very small resistance to rotation due to hysteresis in the steel axle. The magnetic field of the brake magnets tends to produce a non-uniform distribution of induction at the surface of the axle, and if this want of uniform density extends to any depth below the surface, some part of the volume of steel will be going through two small magnetic cycles in each revolution of the axle.

LONDON ELECTRIC LIGHTING COMPANIES AND THE CHANGE OF VOLTAGE.

On Tuesday, the President of the Board of Trade received a deputation from the representatives of the following London electricity supply companies: Westminster, Metropolitan, Chelsea, City of London, County of London and Brush Provincial, Notting Hill, Brompton and Kensington, and Kensington and Knightsbridge. The object sought by the deputation was an alteration of Clause 6 of Section B of the Regulations made by the Board of Trade on March 4, 1896.* That section declares the pressure at consumer's terminals and ends as follows: "Provided that no change shall be made in the pressure of the supply to any premises" (and so on) "except with the consent of the consumer." The proposal of the deputation was to alter "except with the consent of the consumers" by substituting "except on such terms and conditions as may be agreed upon between the undertakers and the consumer, or failing agreement as may be settled by an arbitrator appointed by the Board of Trade."

The officials of the Board of Trade accompanying the President (Mr. Ritchie) were Sir Courtenay Boyle, the Hon. T. H. W. Pelham, Mr. Garnham Roper, and Mr. A. P. Trotter, the Electrical Adviser.

The deputation was headed by Lord Suffield, and included Mr. Boulnois, M.P., General Webber, and the managers of the electricity supply companies.

Prof. A. B. W. KENNEDY said the actual way in which the proviso worked in practice was that it not only gave the right to bona fide objections to the change of voltage—objectors who objected on perfectly reasonable and proper grounds—but it gave the right to any casual consumer to object. Their present object was, or might be, to avoid the blackmailer—that was to say, one who had no reason and did not wish to give any reason, but wished to be paid whatever he chose to demand. In a case of that kind a supply company was bound to go on supplying him, because although in all their districts, with very few exceptions, the policy of the Board had been to keep two competing supplies, it was not their policy to say, will you please go on to the other company to supply you at 100 volts? The consumer, was of course, entitled to say that he would not change, and, in fact, it had been stated in another place that they were not entitled to hand the consumer over to another company, although he might be a consumer who took only a very few shillings' worth of current in the course of the year. When most of the London companies started supply there was a particular limit of what was called low pressure, until that most important conference, presided over by Sir Courtenay Boyle, and that particular clause was put on one side to be discussed in connection with the question of what might be considered low pressure. One of the most important results of the conference had been that the use of higher voltage lamps had become very general practically throughout the whole of the country. It was understood at the end of that conference that the provision as to changes of pressure would be allowed subject to certain regulations which the Board of Trade would propose, or which they would make ; they did not, however, know at the time that there would be an absolute veto given to the change on the part of certain people. He would like to make reference to one paragraph in a letter from the Board in reference to the way in which the change had already been made. It was a letter dated May 24, and contained the following paragraph: "I am, further, to state that although a change of pressure has been effected in respect of several electric lighting undertakings throughout the country the Board are not aware that any difficulties have arisen by reason of the

* See "The Electrician" Electrical Trades Directory and Handbook for 1900, pp. 127-134.

Digitized by Google

existence of the proviso except in the case of one of the memorialist companies." He wished to put before the Board, however, the fact that difficulties had arisen in many other places. The only exception to his knowledge being the municipal station at Edinburgh. They were able there to adopt a means which it was not possible for a private company to adopt. Municipalities had powers which no private companies possessed. The case of the London companies was much more difficult than the case of municipalities, many of the companies having started 10 years ago and at the date of the regulations they had about 3,000 consumers connected with the mains, any one of whom had the power of veto. In the case of Edinburgh there were only a few hundred consumers. The Westminster Company was the first London company to carry out the change thoroughly and systematically. The other companies had begun, and their engineers or directors had told him, he thought without any exception, that they already found difficulties from this clause. It was only at the last moment that the difficulties became absolutely insurmountable. In the particular case of the Westminster Company, to show how hard it was, out of 5,300 consumers they had only 10 now who absolutely refused to change over. One of these consumers only used 3s. worth of current in the year, and another used but a few shillings' worth.

In reply to Mr. Ritchie, who asked what kind of blackmail there could be on 3s. per annum, Prof. KENNEDY said that particular consumer was not blackmailing at all. He mentioned another case in which the company had offered, without prejudice, the sum of £500, which they considered was very ample for the change. This amount was refused, £800 being asked for. The £500 would have covered the alterations very amply indeed. Of course the County Council could impose terms and conditions upon them, and they had imposed certain terms and conditions to which they were bound to work, which they thought very onerous, but they had accepted them and worked under them. Those conditions had involved them in very heavy expenditure, although they had complied with them and had incurred the expenditure. Actually a very infinitesimal number of consumers could at present prevent them carrying out the change to a higher pressure.

Mr. RITCHIE: You have very fairly told me about one or two consumers that you had to deal with, but you made a general application of the possibility of blackmail or something of that nature, and you gave an illustration of the gentleman who wanted £800 when you thought £500 was all that was necessary. You have given that illustration as being an extreme case, I suppose?

Prof. KENNEDY: I do not want to go into details.

Mr. RITCHIE: But it is to some extent a question of detail. There is a certain arrangement—a bargain. These people are quite entitled to say, "We do not want your 200 volts; we prefer 100 volts." It may be that they think there may be more danger connected with the 200 volts than with the 100 volts, or that they might consume more current. And they say, "We do not want 200 volts but to adhere to our bargain." Then you say, with regard to one of these gentlemen, who wishes to be supplied with everything if you give him £800, we are willing to give him £500, and the difference between us is £300. You have 10 objectors on the whole, and therefore you come for the purpose of asking us to make an alteration in the regulations which were agreed to by you and other companies.

Prof. KENNEDY: Never.

Mr. RITCHIE: Which was settled at any rate after conference, and settled by certain eminent gentlemen.

Prof. KENNEDY: Not after conference with the companies.

Sir COURTENAY BOYLE: All the companies were heard. This regulation was discussed at that meeting.

Mr. RITCHIE: What I want to get at is really what is the burden which was imposed upon you to arrange with these gentlemen rather than to come to us for a change in the regulations. You have told us in regard to one of your 10, who was a gentleman who consumed 3s. worth, but that is not a man difficult to arrange with.

Prof. KENNEDY: He is most difficult; I cannot arrange with him.

Mr. RITCHIE: It would be an impossibility for a man who consumes 3s. worth of current to wrestle long. But putting him on one side, you spoke of a possible arrangement with the man who wanted £800, and you proposed to give him £500. What about the others?

Prof. KENNEDY: We should not allow a few hundred pounds to stand in the way. He is a gentleman, and he says under your clause he can prevent us. Then there is a small shopkeeper, who consumes £2, and he absolutely stops us.

Mr. RITCHIE: Have you ever offered to give him his light for nothing if he took it?

Prof. KENNEDY: I am sure the 3s. man would not take it.

Mr. RITCHIE: But what about the £2 man.

Prof. KENNEDY: We have tried everything. There is another gentleman in a very good position who objects on the ground of safety; he is a large consumer of current, and to him no question of difference in price would alter his decision.

Mr. RITCHIE: Are you sure that the Westminster has gone the right way to propitiate people, because I have seen circulars sent by your company which do not seem to go on conciliatory lines. [Mr. Ritchie then read half-a-dozen letters addressed by the Westminster Company to their customers.] Those notices were *ultra vires*, for the Westminster could not insist upon supplying their customers with 200 volts or refuse to supply them with 100 volts.

Mr. BOULNOIS: We can charge them 8d.

Mr. RITCHIE: Yes.

Prof. KENNEDY: We have offered a reduction of 8 per cent. for this matter. But he should like to deal with one point which had often been raised that this change was a matter which was going to make a large profit to the companies. It was not a change which enabled them to sell for less in any way, except for a certain time it saved in cost of main, because they could transmit through a main of a given size, but it did not save in generating expenses. The actual figures were these: Taking 20 years hence, and making a very careful estimate of the Westminster Company's outgoings, supposing they could not change over and spend £800 or £900 a year on mains, including current loss, the expenditure would be £412,000, whereas, if they could make this change at the end of the same time the cost would be £214,000, including interest and so forth at the same rate. That worked out one-seventh of a penny per unit. That was the whole of the saving, but it enabled them not to pull up the streets or otherwise go on laying mains continually.

Mr. RITCHIE: But the company would, roughly speaking, save £200,000.

Prof. KENNEDY: But that would be spread over several million units.

Mr. RITCHIE: That is not material, but it is the large saving I am thinking of.

Prof. KENNEDY: But the public are gainers, because our mains have a much greater capacity, and we have not to pull up the streets to relay the mains, and we are fairly entitled to say that whatever money we save here the public will save afterwards, because they will have the power to buy us up 30 years hence. Then it was said that these lamps used more power than others. They had made a most careful examination of lamps using 100 volts and 200 volts to satisfy themselves whether the higher voltage used more energy. The result was that over one million and a-half there was only an increase of 2 per cent. There was a difference in the use of good and bad lamps at high pressure, but there was no difference *per se* actually due to the pressure. The companies had agreed on what they should like to suggest as a possible alteration of this regulation.

General WEBBER said the Board of Trade hardly realised that at the conference of 1895 it was considered that it must be in the interests of the whole of the public of London that the voltage generally should be raised from 100 volts to 200 volts. They hoped the Board would be able to remove a disability which would not work any injustice to the consumer.

Mr. RITCHIE, in reply, said he had listened very carefully to what Prof. Kennedy had said. Of course the representations which he had made and which had been supported by the other gentlemen present would receive his careful consideration, and the suggestions which Prof. Kennedy had made he should be glad to consider in association with those who advised him on matters of that kind. He admitted at once that on the face of it it did seem a strong order that a very small number of persons such as was named by the Westminster Company (about 10) should be able to stand in the way of a complete application of the new system of which they had spoken. At the same time it must be borne in mind that those gentlemen were really within their rights and that if the Board of Trade were to assent to what the companies proposed they would be practically overriding the rights which those consumers at present possessed. He did not want to enter into the reasons why those various gentlemen had refused to fall into line with the large number of consumers who were supplied by the company. Some of them might be actuated by motives which were laudable, and others not, but in any case the Board of Trade was asked by the proposal that was made to override the rights which those gentlemen possessed. If it could be conclusively shown that the difficulties which were encountered by the opposition of that small number were of such a nature as really greatly to interfere with the companies, of course it would be a strong argument in favour of some such amendment as was suggested. He could not say that it had yet been conclusively shown that everything that could be done to bring these gentlemen into line had been done. All the notices to which he had referred had proceeded from the Westminster Electric Supply Corporation, and he thought everybody would admit that those notices, if they were addressed to persons who had a present right to take up the position that they did take up, were rather strong, and they were not of a nature which he himself, if he had been asked to conciliate persons who did not do what one wished them to do should have adopted.

Mr. BOULNOIS: These were after two years' negotiation.

Mr. RITCHIE: Never mind, that may be so, and that very much mitigates the force of my observations. But at the same time if they were addressed—we have not the names, only the circulars—to persons who had the right to demand supply at 100 volts, and whom you could not refuse to supply, they were too strong. I do not make these observations with an idea of leading you to believe that I will not consider the representations that you have made, but it has occurred to me in reading these that all the resources of civilisation have not yet been exhausted, and that it is quite possible that so far as the Westminster, at any rate is concerned, further negotiations may perhaps remove the difficulties.

Lord SUFFIELD: To meet your difficulty I would like to say that there were earlier letters for two years to my knowledge, for I never failed to be present at the board meeting, and those letters were the most courteous letters that were ever penned. It was only lately, when it was evidently as much to the advantage of the consumer as to the company, that the other letters were written. I admit that they were a bit strong, but every other method had been tried first.

Mr. RITCHIE: The fact remains that you cannot, as far as I understand the law, refuse to supply any consumer at 100 volts if he desires to have it. I have not yet heard what was the particular inconvenience suffered by the company in supplying those customers who are now being supplied with 100 volts. What particular inconvenience was suffered by the lighting company, and what was the measure of the inconvenience in pounds, shillings and pence?

Prof. KENNEDY: It simply means that they were more or less scattered. We could not supply 100 volts and 200 volts because we had not the means.

Mr. RITCHIE: You are supplying consumers at those 200 volts?

Prof. KENNEDY: I believe the letters you have read were directed to

Digitized by Google

persons who had no right of supply before 1896. We should have to send out special mains from the station to supply these consumers at 100 volts.

Mr. RITCHIE: You are supplying them now with 100 volts?

Prof. KENNEDY: 200 volts, I think.

Mr. RITCHIE: Within the district that you are supplying 200 volts there are certain individuals who get 100 volts. What is the particular inconvenience in pounds, shillings and pence?

Prof. KENNEDY: We have to set apart for those consumers mains which cost us a good many thousand pounds and special generating plant.

General WEBBER: We must keep for those people a special generating station.

Mr. RITCHIE: Would it be many thousand pounds per annum?

Prof. KENNEDY: No. Capital expenditure.

Mr. RITCHIE: But your capital expenditure only has been incurred.

Prof. KENNEDY: It represents 1s. per unit.

Mr. RITCHIE: And you get 6d.

Prof. KENNEDY: 8d.

Mr. RITCHIE: So that the actual cost is 4d. per unit upon their consumption. If it costs you a shilling at 100 volts and you only get 8d. for that you lose 4d. on the supply. On the consumer who takes 3s. worth that would not be much.

Prof. KENNEDY: We cannot get at him.

Mr. RITCHIE: Perhaps, you will give me some particulars as to what the actual cost in pounds shillings and pence would be about, without counting capital expenditure which has already been incurred. What is the loss to you on the 10 consumers who are recalcitrant?

Prof. KENNEDY: I will give it.

Mr. RITCHIE: I will then consider that along with the other matters.

General WEBBER: The companies would like to be allowed to go more into detail considering that now your mind is on the subject, and we might be able to submit our case to you later on. Each company has got its difficulties in various changes from 100 volts to 200 volts, and the Chelsea Company has encountered these difficulties in every street in their district. Shall I write a letter to the Board of Trade to that effect?

Mr. RITCHIE: By all means. My observation is not directed to the Westminster Company, but to all the companies interested.

A vote of thanks was accorded to Mr. Ritchie.

PARLIAMENTARY INTELLIGENCE.

MUNICIPAL TRADING.

At the July 14 sitting of the Joint Committee of Lords and Commons on Municipal Trading, the Earl of Crewe presiding,

Mr. W. JEEVES, town clerk of Leeds, and formerly town clerk of St. Helen's and assistant town clerk of Peterborough, said that, speaking from experience, he was perfectly certain that the actuating motive of corporations in taking up gas, electric, and other undertakings was not a pecuniary one, but was the better service of the community in matters which, if not absolutely essential to life, were certainly essential to the well-being of the community. As to tramways, he was more and more convinced that they were an absolute necessity in any large community, and he saw no possibility of solving the difficulty of housing the working classes and some of the classes above the working classes except by the extension of tramways. Whether gas, water, electric lighting, and tramways undertakings were in the hands of companies or corporations, he thought they ought to be in one set of hands—that they should be monopolies. A certain power of veto by local authorities over tramways was necessary.

Asked by the chairman whether he thought that the Parliamentary and departmental checks on the introduction of novel and experimental powers were sufficient, witness said he thought they were. Special powers were never obtained without a special inquiry by a Parliamentary Committee and after they had been subject to the criticism of the ratepayers. He did not wish to say it offensively, but the Local Government Board reports on private bills were really a terror to municipal authorities. One never knew what the Board was going to say. They never let a point slip, and they very often, he thought, took many points that might very well be left alone. But he thought the Local Government Board reports were of great value.

Do you think it possible to lay down any hard and fast rule on this subject?—I think not. If you lay down a general rule that a corporation shall not manufacture you put a stop to the manufacture of gas. If you say they shall not sell articles you make it impossible to sell or let gas or electric fittings on hire. Experience has shown that in many cases it is necessary to do this.

Why do you say necessary?—It is necessary for the purpose of developing the consumption of the article. In the matter of electric fittings at St. Helen's it was found that it was necessary for the electric lighting authorities to supply them. Neither the landlord nor the tenant would go to the capital expense of wiring their houses though they would pay so much a year on account of the wiring.

Sir W. FOSTER: But you are aware, are you not, that it is very hard on the small traders and manufacturers of St. Helen's for the Corporation to supply these fittings?—I do not think so. As to the manufacturers, I do not see why a corporation should manufacture the fittings: they could purchase from the manufacturer. As to the traders, they could not undertake the work as the corporation could. The corporations do not desire to compete with the retailer. At Leeds to-day the Corporation do not supply any fittings at all, though they supply stoves. If you went from town to town you would find that the amount of fittings supplied would be very small.

Sir W. FOSTER: But have they not crushed the stove dealers out of existence?—No, I think not, because, as a matter of fact, there are very few stoves used except those which are lent on hire. People will not buy them. I should say that manufacturers of stoves have benefitted infinitely more through the corporations taking up the gas business vigorously than the retailer has lost.

The CHAIRMAN: Do you think it right for a corporation to undertake a business which would admittedly damage a number of retailers?—It is hard to answer on general principles. I condemn it rather.

Would you go so far as to say that no retailer should ever be injured by corporation competition?—No; I should say that if the general good of the community requires, as in some cases it does, that there should be competition, competition should take place. Unless there is a balance of advantage I do not think that corporations ought to undertake competition, and I do not think they do undertake it.

WITNESS went on to give statistics as to working of the Leeds tramways by the Corporation. He said that many of the streets had had to be widened at enormous cost. When the Corporation took over the tramways in July, 1894, there were only about 8 miles of double and 22 miles of single lines. There were now 23 miles of double and 49 miles of single lines. Passengers had increased from 8½ to 27½ millions, and car receipts from £43,000 to £126,000 per annum. As the receipts had not quite doubled, while the number carried had increased nearly three and a-half times, it was evident that the users had benefitted. All the tramways were being converted as quickly as possible into electric lines. The employees were in a much better position than they were under the company, as they got better wages and worked shorter hours. In a statistical sheet laid before the Committee the number of boroughs working tramways in March, 1899, was 17, the number leasing tramways or lines to companies being 10. The total length of line worked by nine boroughs furnishing information as to the number of car miles run was 191¼ miles, the total number of car miles run being, in the year ended March, 1899, 11,934,000, the population served being 2,006,334, and the number of car miles run per mile of route 62,404¾. With regard to electric undertakings, there were 51 included in the return, the population represented being 5½ millions, and the rateable value £29,465,173. The capital expenditure to March, 1899, was £4,452,944, the total capital paid off, including sinking, redemption, and reserve funds, being £394,646, and the percentage paid off to capital expenditure 8·86. In this connection it must be observed that the average period of ownership had been less than four years. The number of Board of Trade units supplied during the year ended March, 1899, by 45 boroughs was 28,445,303, and the total income from charges to consumers for the year was £487,815. The number of boroughs in the return showing profit and loss to rates was 31, the profit was £21,625 and the loss £10,725. It was found, however, that in the earlier stages of an electric undertaking there must be a loss.

That you think justifies you in concluding that these enterprises have been well carried out?—Yes. It could not be shown in a single instance that there had been any lack of enterprise on the part of corporations in carrying on undertakings of this kind, nor could it be shown that the principles of management were bad, nor that the consumer or the community had suffered.

You do not think that these trading matters interfere with the other duties of corporations, such as sanitary and police duties?—I am absolutely sure that they do not. Witness added that he thought the decision of Sir J. Kitson's Committee on Electric Power Bills was a distinctly right and proper one, and one that fairly met the contending interests.

On July 17 Mr. MOORE HAYTON, town clerk of South Shields, said in the evidence of Mr. Swinton it had been stated that he (Mr. Hayton) had received a proportion of the fees paid to certain Parliamentary agents in connection with the Tyneside Electric Power Bill. It was the case that Messrs. Sharpe, Parker & Co., the Parliamentary agents, had written offering to hand him over a proportion of the fees, but he was prohibited by the terms of his appointment from receiving any such allowance, and the Town Council of South Shields understood that if Messrs. Sharpe, Parker & Co. were appointed no allowance would be made to him personally. The Town Council, knowing this to be so, appointed Messrs. Sharpe, Parker & Co. as their agents. It was usual now for town clerks to receive inclusive salaries.

Mr. G. LIVESEY, chairman of the Gas Companies Protection Association and chairman of the South Metropolitan Gas Co., expressed the opinion that the first and chief public consideration in connection with the supply of gas was unquestionably the interest of the consumers. He considered that their interest could be best promoted, not by local authorities, but by companies. One of the reasons given in favour of ownership by local authorities was that they alone had the right to do anything in the public streets. More could be said against this contention than in its favour. It was merely a sentiment. Since the application of auction clauses to gas companies in 1877, there was now very little in the contention that local authorities could raise money at lower rates than companies. The main reason why local authorities acquired gas undertakings was to be found in the desire to make a large surplus profit out of the gas consumers to aid the local rates. This he considered as being most unjust to gas consumers. Corporations, generally speaking, in England, kept up the price of gas as high as they dared, in order to get as large a sum as possible in aid of rates. These surplus profits ranged from 1·46d. per 1,000 feet in case of Birmingham to 6·75d. in Bolton. The gas committees of corporations were constantly changing, and were commonly, with some exceptions, indisposed to treat their responsible managers with the liberality and consideration necessary to secure the best service. Corporation gas works were more amenable to trade union control than companies. Leeds was a striking case in point. Even in such a well-managed place as the Glasgow gas works a determined attempt was made this year by the trade unions to obtain control. The interests of individual gas consumers were relatively too small to lead them to combine to ensure fair consideration of those interests by the elected representatives of the ratepayers. It

Digitized by Google

might safely be said that if all the gas undertakings were in the hands of local authorities there would be practically no more reductions of price. The supply of gas being necessarily a monopoly, it was better, in his opinion, that it should be regulated by Parliament and controlled by the local authority. The introduction of the slot meter system was due to the companies, Liverpool taking the lead. Companies, whose continued prosperity depends on pleasing and satisfying their customers, must serve those customers better than corporations, where such incentive was lacking.

Mr. J. H. KELLY, of the Traders' Defence Association of Scotland, said he represented 2,800 members. He considered municipalities had facilities that established unfair conditions in trade and commerce. He regarded it as a menace to the State, in respect that a municipality, working with the object of having little or no profit, did not contribute to the State by paying income tax, with the result that traders had to pay increased taxation. With regard to local rates, the same thing happened. His association admitted the desirability of the municipalisation of water and gas, as these enterprises did not lend themselves to competition. He had not the same opinion regarding tramways or building operations. Tramways were merely a means of conveyance, and could be taken up by anyone. They had heard a great deal about the success of the tramways in Glasgow; but that success had been established by the preceding company, in the face of conditions laid down by the Corporation, and not adhered to in their own working. As to the employees question, municipal employees in Glasgow as a rule cast their votes in favour of the nine members of the Council who were trades unionists; and not only so, but they influenced other labour parties to do the same. There was the growing evil of increasing the number of employees so that they might have undue influence on the Council. There was not much to be said on the electric system of Glasgow. The Corporation took powers to prevent another company from getting it. His complaint was that, having taken the powers, the Corporation did not use them. The telephones in Glasgow had been taken over by the Corporation not so much from an admitted necessity, but from the desire to have these powers in their own hands. The licence was granted more because of the importunity of the Corporation than from the fact that the Postmaster-General was convinced in the matter. As regarded efficiency, he declared that the Corporation stood in the way of the system of the National Telephone Co. being improved by refusing to grant them facilities. He did not think it was necessary to take over a telephone system if the company could conduct it as well as any other body. Gas and water were about the limit he was inclined to admit corporations to go in respect of trading. He would not necessarily include electric lighting. Admitting the extent to which the corporations had taken up municipal trading, there were so many auxiliary trades involved that the difficulty of defining a limit was increased. Tramways, for instance, carried with them the making of cars, smiths' and painters' work, and other departments, and the possibility to which municipal trading might run to the detriment of private trading was increased almost indefinitely. In Greenock the corporation had had to impose a tax to make up a deficit in respect of their building operations.

On July 20, Mr. SHEPPARD, builder and contractor, Bermondsey, at one time a member of the late Metropolitan Board of Works, said: In his view, if a municipality wanted to undertake building works, they should be subject to an open competition with private firms.

Dr. KINGSBURY, Mayor of Blackpool, said: Blackpool Corporation's undertakings included gas, electric lighting, markets, tramways, cemetery, abattoirs, sanitorium, public lavatories, free library, technical schools, and, in partnership with other boroughs, the waterworks. The gas works had been established for upwards of 40 years. The Corporation had very much reduced the price of gas and had improved their plant very materially. They had devoted a certain amount of profits from the undertakings to the relief of the rates. In 1864 the price of gas was 5s. 10d. per 1,000, while at present it was 2s. 4d. The Corporation supplied meters. To the working classes they supplied slot meters, and to the public burners free. They also supplied "grillers" free to working people. The public lighting, which was very well managed, was at practically cost price.

The Blackpool electric lighting works had been established seven years. The capital was £117,000, and there was an accumulated sinking fund of over £9,000. The income in the seven years had been £74,000, gross profits £28,000, net profits £6,200. The average net profit had been 1 per cent. on the outlay. The street lamps were supplied at cost price, the meters being free. In 1894, with 56 customers, the price was 6d. per unit, now there were over 900 customers, and the price varied from 7d. to 2d. per unit. The customers numbered one in 50 of the population, and one in 10 of the inhabited houses. In Blackpool there were no manufactures, but some small works (such as printing works) were supplied with electric power.

The CHAIRMAN: Having gas works of your own, has this hampered electrical development?—No. There is friendly rivalry, but far from hampering, one stimulates the other. I think the public greatly benefit from having the two concerns in the same hands. We were the first borough in the country to adopt public electric lighting. Though we only got the order for the domestic supply seven years ago, our streets have been lighted by electricity longer than those of any town in England. The Corporation had had control of the tramways for eight years. Blackpool was the first English town to adopt electric traction in the streets. The actual outlay on the tramways in the eight years had been £98,000. The gross profit was £31,000, the net profit £13,000, the average annual net profit being 3 per cent. on the outlay. The fares were extremely low, and the Corporation had extended the system very much as compared with the company which formerly owned the tramways.

The CHAIRMAN: What do you say as to tramways outside your own area?—We have not yet acquired any tramways outside, but we have two tramway companies at work in Blackpool—the Lytham and the Fleetwood Companies. We have given them every facility within the borough. In each case we have allowed them to come up to a railway station as a terminus. One is an electric tramway and the other is worked by compressed gas We have constructed a line for them, and they pay us a rent which covers the repairs of the roads. We have brought our own system of tramways up to meet them, so that there is a constant interchange of passengers. Personally, I think it would be better if the Corporation controlled those other lines, because we should then have uniform management and a reduction of expenses.

The Committee then adjourned till July 24.

ELECTRIC LIGHTING IN THE EAST END OF LONDON.

Particulars of the proposed agreement between the County of London Company and the promoters of the bill confirming the provisional order for Limehouse, Mile End Old Town, and St. George's-in-the-East were fully set out in our last issue. On July 20 the Committee entered on the consideration of clauses.

Mr. PEMBER said the parties had come to partial agreement regarding the amount to be paid by the local authorities to the company on the company undertaking to abandon their order for the supply of the three districts referred to, but, as in so many cases, there was a difference of view as to the amount. Speaking for the County of London Company, it seemed to him they ought to ask the Committtee for the costs of preparing, obtaining, and passing the order of 1897 for the supply of the three districts; for the costs of the company in opposing the orders which the three local authorities had gained; and the bill to confirm them; and then he thought he was further entitled to such costs as an arbitrator, in default of agreement, might say the company had incurred for the purpose of supplying within these three districts, which costs he should not otherwise have incurred and which he could not otherwise use. The consideration for these grants would be that, in a district in which it would not be fair that there should be competition, the company would retire and leave the local authorities to supply themselves. He then handed in a clause carrying out the points he had indicated.

Mr. SHIRESS WILL objected *in toto* to the clause.

A prolonged discussion followed, in the course of which the counsel for the local authorities said they had no wish that the company should retire from the area but would prefer that they should remain and compete. The Committee adopted the somewhat unusual procedure of settling the details of the clause, after which argument took place as to whether it should be inserted at all, the representatives of the local authorities objecting and Mr. Pember (for the company) supporting the suggestion. The Committee deliberated, and in the result decided that the clause should be inserted. Further disussion followed, chiefly as to drafting, and eventually the clause was adopted in the following form:—

Clause 3A. For the protection of the County of London and Brush Provincial Electric Lighting Co. (Ltd.):—

1. If, within six months from the date of the passing of this Act, the County of London & Brush Provincial Electric Lighting Co. (Ltd.) (in this section called "the company") serve upon the Board of Works for the Limehouse District and the vestries of Mile End Old Town and St. George's-in-the-East or their successors (hereinafter called "the local authorities") notice in writing specifying the amount which they claim as representing the cost of preparing, obtaining, and passing the County of London East Electric Lighting Order, 1897, and so much of any costs properly incurred by the company with the object of affording a supply of electricity within the district of the local authorities as shall, in the opinion of the arbitrator, to be appointed as hereinafter mentioned, have been incurred beyond what the company would otherwise have incurred, regard being had to whether any such costs incurred for works has been or may hereafter be utilised by the company, such local authorities shall, within three months from the receipt of such notice, unless they dispute the amount claimed therein, paying the same in equal shares to the company, provided that, except as aforesaid, such costs shall not include legal or Parliamentary expenses connected with the promotion by or opposition to bills in Parliament or provisional orders.

2. If the local authorities or any of them dispute the amount so claimed the question of the amount of such costs shall be determined by an arbitrator to be appointed on the application of the company or any of the local authorities by the Board of Trade, and within three months from the date of the award of such arbitrator, the amount thereby awarded shall be paid by the local authorities to the company.

3. Upon the payment by the local authorities of the amount so claimed or awarded as aforesaid the County of London East Electric Lighting Order, 1897, shall be and is hereby revoked, and the powers, rights, privileges, authorities, and obligations thereby conferred or imposed upon the company shall cease.

4. No part of any payment made under this section by the Corporation of the borough of Stepney shall be charged upon that part of the said borough which is at the date of the passing of this act the district of Whitechapel.

The remaining clauses having been adjusted, the bill was ordered to be reported.

GLASGOW TRAMWAYS.

The Select Committee of the House of Commons, presided over by Sir Lewis McIver, on July 19, had under consideration the bill of the Glasgow Tramways Co., seeking powers to construct and work a new series of electrical tramways in and around Paisley and Renfrew, the promoter being Mr. W. M. Murphy of Dublin. Some proceedings in connection with this bill were reported in our last issue, p. 491.

Mr. PEMBROKE STEPHENS, Q.C., said the proposed tramways would serve a very considerable district, including Paisley, Johnstone, Renfrew, Ellerslie, and many other towns, and the project had received universal support.

Mr. BARRINGTON, C.E., of Limerick, engineer of the scheme, said existing railways would not be interfered with. The estimates for the

Digitized by Google

tramways, including what had been imposed upon them by the local authorities, was £227,669.

Evidence was given by local witnesses as to the need of the tramway, and the public feeling in favour of its construction.

Mr. W. M. MURPHY said in his opinion the tramways would be entirely successful. The existing railways would not be injured by the tramways, which would indeed be found to be useful feeders of their lines.

Mr. CHARLES FORMAN, for the opponents, the Paisley & Barrhead District Railway Co., said he had constructed the railway which was authorised in 1897. It was completed and was on the point of being opened for traffic. It was purely a local line, and the proposed tramway would seriously compete with it. One of the sections of the proposed tramway was from Potterhill to Glenfield, and if this part were sanctioned it would take away a part of the workmen's traffic at Glenfield, for whose accommodation the company had provided.

The CHAIRMAN said the Committee were impressed with the excellence of the scheme, but they realised that Mr. Murphy had been encountered by a number of different public bodies with conflicting views and with different degrees of capacity. This line had been given up on the opposition of Glasgow, and all that remained of the excellent scheme was the line to Johnstone, which would tap the centre of Paisley and feed Glenfield. That was the result of a system of blackmail on the part of the local bodies. All of them approved of a gentleman of experience and capital coming from Ireland and providing them with what they could not get for themselves. They were all very glad, but they had their joy from Mr. Murphy, and screwed as much out of him as they could. Then there was the mileage rate for wayleaves, the legality of which might be questioned. In his view the proper business of a municipality was to maintain the roads for the use of the public and not to sell wayleaves. He asked Mr. Murphy whether he now considered the scheme was worth going on with.

Mr. MURPHY said in his opinion the workability of the scheme had not been seriously affected.

The CHAIRMAN said the Committee found the preamble of the bill was not proved. They desired to put on record that, in their opinion, the original scheme was a good one and calculated to be of much use to the district; but it had been so mutilated and loaded with conditions by conflicting interests and the excessive demands of several local bodies, that it now appeared to the Committee to be wholly unworkable.

(Parliamentary Intelligence continued on page 525.)

ELECTRICITY WORKS ACCOUNTS.

Hanley Municipal Electric Supply Works.

The first of our two analyses this week deals with the accounts of the fifth year of working of the Hanley undertaking. In view of the figures in our table it is superfluous to observe that the results of the year's operations were most unsatisfactory. The fact that the unfortunate position of the concern is partly explained by the breakdowns in the plant hardly serves to relieve the general situation—rather the reverse. On the other hand there are some items of cost which indicate that when the immediate troubles have been met there is every prospect of a great improvement being shown in the accounts. These favourable figures are those of wages at the station and management and property charges, while the moderate capital expenditure should exercise a beneficial influence through limiting the capital charges on revenue.

Unfortunately, the tariff system of the undertaking appears to be much at fault. With a total average revenue from all sources of no more than about 3·93d. and from supply of not quite 3·16d. per unit, it is surprising to find that the output for the year indicates an increase of only 13·4 per cent., while the lamp connections at December last were not more than 15·7 per cent. above those at December, 1898. In view of this the conclusion is hardly avoidable that the comparatively low initial price per unit, and generally the tariff arrangement, has encouraged a class of consumer who, by the character of his demand, neither benefits the undertaking, nor is particularly benefited by being a customer of the department. It is interesting to learn from the report accompanying the official accounts how the present tariff came about. In the early part of 1896 the prices of 6d. and 3d. were decided on—the latter price coming into force after a certain consumption. Owing to opposition this tariff was replaced by one under which the simple price of 5d. per unit was charged, this remaining in force for two years. Unfortunately we learn that it was then "difficult to raise the price," and a tariff of 5d. to 2½d. was adopted.

Turning again to the expenditure out of revenue, we learn from the electrical engineer's report that of the fuel item the advance in the price of coal which commenced in June last year was responsible for nearly £400. Extraordinary amounts of fuel consumption occurred owing to the engines working non-condensing, both condensing plants having broken down. The repairs and maintenance item naturally suffered from the mishaps, the condenser repairs costing over £150, and the replacement of stokers by forced-draught furnaces entailing an outlay of £200.

Wolverhampton Municipal Electric Supply Works.

It is highly gratifying to find from the last accounts of this undertaking that its good progress is being so well maintained even in distinctly adverse circumstances.

After making allowance for the inevitable influence of the advanced prices of coal, the generating costs as well as the management charges have been reduced, and, with the exception of the item of oil, waste, &c., stand at most favourable figures. It is pointed out by the chairman of the Electric Lighting committee that the alteration in the system of supply has necessitated two systems being in operation for the latter six months of the year, involving increased consumption of fuel, while delay in the completion of the battery room at the station seriously handicapped the department.

Owing, however, to the very moderate costs other than the fuel item, the works and total costs exhibit figures which practically represent the average at the output and the low load factor of only 6·8 per cent.

In the original accounts there is included under the item of repairs and maintenance at the station a charge of £912, cost of changing over system of distribution. This item we have merely debited to the net revenue account, thus permitting of a more legitimate comparison of the ordinary costs. The following table gives an idea of the progress of the concern:—

Year.	No. of consumers.	Equiv. No. of lamps cnnctd.	Per cent. increase.	No. of units sold.	Per cent. increase.	Max. demand. k w.	Ultimate financial result.
1895–6	113	8,941	...	191,701	...	210	£1,403 loss
1896–7	154	11,307	26·0	224,709	17·2	240	£226 profit
1897–8	208	14,151	25·2	291,233	29·6	318	590 ,,
1898–9	276	19,932	40·8	371,830	27·7	420	1,004 ,,
1899–00	364	25,184	26·3	482,247	29·7	806	402 ,,

The following is a list of electric supply works the accounts of which have been analysed, together with the dates on which statements and analyses of accounts have appeared:—

Aberdeen (Municipal)	Jan. 12, 1900	Kingston-on-Thames (Mun.)	July 10, 1900
Ayr (Municipal)	Sept. 22, 1899	Lancaster (Municipal)	Jan. 19, ,,
Bath (Municipal)	April 20, 1900	Leeds (Municipal)	Dec. 1, 1899
Bedford (Municipal)	May 19, 1899	Leicester (Municipal)	Jan. 26, 1900
Belfast (Municipal)	July 6, 1900	Leyton (Municipal)	Sept. 8, 1899
Birmingham (Company)	Sept. 15, 1899	Liverpool (Municipal)	June 22, 1900
Blackburn (Municipal)	Jan. 19, 1900	London (Company)	June 8, ,,
Blackpool (Municipal)	Sept. 29, 1899	Londonderry (Municipal)	Feb. 16, ,,
Bournemouth (Company)	April 28, ,,	Manchester (Municipal)	Aug. 11, 1899
Bolton (Municipal)	Nov. 24, ,,	Newcastle and District (Co.)	Oct. 6, ,,
Bradford (Municipal)	June 22, 1900	Newcastle-upon-Tyne (Co.)	April 14, ,,
Brighton (Municipal)	May 4, ,,	Newport (Mon.) (Municipal)	Dec. 15, ,,
Bristol (Municipal)	July 14, 1899	Northampton (Company)	Oct. 20, ,,
Bromley (Kent) (Co.)	June 15, 1900	Norwich (Company)	Nov. 17, ,,
Brompton & Kensington (Co.)	Mar. 23, ,,	Notting Hill (Company)	Mar. 16, 1900
Burnley (Municipal)	Aug. 26, 1899	Nottingham (Municipal)	July 21, 1899
Burton-upon-Trent (Mun.)	April 21, ,,	Oldham (Municipal)	Dec. 1, ,,
Bury (Municipal)	Sept. 22, ,,	Oxford (Company)	April 13, 1900
Cambridge (Company)	April 13, 1900	Pontypool (Company)	May 5, 1899
Cardiff (Municipal)	Dec. 15, 1899	Portsmouth (Municipal)	July 14, ,,

The Electrician.

The Oldest Electrical Journal (established as a weekly Journal 1861—1878

Published every Friday, Price Sixpence; Post Free, Sixpence-Halfpenny.
Editorial Publishing and Printing Offices,

1, 2 & 3, SALISBURY COURT, FLEET ST., LONDON.

Telephone: 949 Holborn. *Telegrams:* "ELECTRICIAN NEWSPAPER LONDON."

All Letters relating to Subscriptions, Advertisements, and other business matters should be addressed to the Publisher "THE ELECTRICIAN," *Salisbury-court, Fleet-street, London, E.C. Cheques and Money Orders should be made payable to* "THE ELECTRICIAN" *Printing and Publishing Company, Limited, and be crossed "Coutts and Co."*

All Editorial letters to be addressed to THE EDITOR.

All letters for insertion in "THE ELECTRICIAN," *or containing questions, must be accompanied by the name and address of the writer as evidence of good faith. No notice whatever is taken of anonymous communications.*

"THE ELECTRICIAN" *is published every Friday morning, in time for the morning mails. It is on sale at the railway bookstalls throughout the Kingdom on Friday morning, and can be obtained of all Booksellers and Newsvendors; or direct from the Publishing Offices, as above*

Subscription Rates.—The Rates for Subscriptions to "THE ELECTRICIAN" are as under:—

	YEAR	HALF-YEAR	QUARTER	
United Kingdom	26s. 0d.	13s. 6d.	7s. 0d.	Post free, payable in advance.
Postal Union	30s. 0d.	16s. 0d.	8s. 0d.	

New Volumes of "THE ELECTRICIAN" *commence in April and October.*

"THE ELECTRICIAN" *offers exceptional advantages to Advertisers.* **It has by far the largest circulation of any English Electrical paper, and circulates all over the World.** *This statement is guaranteed.*

Advertisement Rates, &c., forwarded on application to the Publisher.

TRADE ADVERTISEMENTS *intended for the current issue must reach the Office not later than First Post on Thursday. Renewals of expiring advertisement orders and alterations to standing advertisements must be in Publisher's hands by Wednesday. Wrapper Advertisements by Wednesday morning.*

OFFICIAL ANNOUNCEMENTS, AUCTIONS, *and* SMALL ADVERTISEMENTS *accepted up to 6 p.m. on Thursday.*

ELECTRICAL BOOKS AND PUBLICATIONS.

All Books, Newspapers, and other publications can be ordered direct of THE ELECTRICIAN" *Printing and Publishing Company, Limited. The well-known* "ELECTRICIAN" SERIES *of Standard Electrical Works at present consists of—*

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. ELTON YOUNG, M.I.E.E. Price 10s. 6d., post free; abroad 11s.

THE STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By Messrs. H. K. C. FISHER and J. C. H. DARBY. Price 6s. net; abroad, 6s. 3d.

BIBLIOGRAPHY OF X-RAY LITERATURE AND RESEARCH. Edited by C. E. S. PHILLIPS. With an introduction on the history of Crookes Tube and Röntgen Ray work, and a chapter giving "Practical Hints" on the subject.

THE POTENTIOMETER AND ITS ADJUNCTS. By W. C. FISHER. Price 6s., post free.

LOCALISATION OF FAULTS IN ELECTRIC LIGHT MAINS. By F. C. RAPHAEL. Price 5s., post free.

MOTIVE POWER AND GEARING. By E. TREMLETT CARTER. Price 12s. 6d., post free.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. WILKINSON. Price 12s. 6d., post free.

ELECTRICAL LABORATORY NOTES AND FORMS (Elementary and Advanced). Arranged by Dr. J. A. FLEMING, M.A., F.R.S. Printed particulars on application.

ELECTROMAGNETIC THEORY. By OLIVER HEAVISIDE. Vol. I. Price 12s. 6d., post free 13s. Vol. II. Price 12s. 6d.; post free, 13s.

THE ALTERNATE CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Dr. J. A. FLEMING. VOL. I.—THE INDUCTION OF ELECTRIC CURRENTS. NEW EDITION. Price 12s. 6d., post free. VOL. II.—THE UTILISATION OF INDUCED CURRENTS. Price 12s. 6d., post free.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. FLEMING, M.A., D.Sc., F.R.S. New Edition. 93 original illustrations, price 6s.

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. EWING, M.A. New edition. Price 10s. 6d., post free; abroad 11s.

ELECTRIC MOTIVE POWER. By A. T. SNELL. 10s. 6d. post free.

THE ART OF ELECTROLYTIC SEPARATION OF METALS (Theoretical and Practical). By Dr. GEORGE GORE. Price 10s. 6d., post free.

ELECTRO-CHEMISTRY. By Dr. GEORGE GORE. Price 2s., post free.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. KENNELLY and H. D. WILKINSON. Price 6s. 6d., post free.

DRUM ARMATURES AND COMMUTATORS (Theory and Practice). By F. M. WEYMOUTH. Price 7s. 6d. post free.

THE INCANDESCENT LAMP AND ITS MANUFACTURE. By GILBERT S. RAM. Price 7s. 6d., post free.

A POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. GRIPEL and H. M. KILGOUR. Price 7s. 6d. net, post free 7s. 9d., abroad 8s.; large-paper edition, 12s. 6d., post free. New edition in the press.

"THE ELECTRICIAN" PRIMERS. In Two Vols. Paper covers, 2s., post free 2s. 2d. each; strong cloth 2s. 6d., post free 2s. 9d. each. Single Primers 2d., post free 2½d.

WIRELESS TELEGRAPHY: SIGNALLING ACROSS SPACE WITHOUT WIRES BY ELECTRIC WAVES. By Dr. O. J. LODGE. New Edition. Price 5s. net.

A DIGEST OF THE LAW OF ELECTRIC LIGHTING, ELECTRIC TRACTION, TELEGRAPHS, TELEPHONES, &c. A. C. CURTIS-HAYWARD, B.A. To January, 1900. Price 3s. 6d., post free.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By FRANCIS JEHL. Price 10s. 6d., post free.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. A Practical Guide to the Establishment of a Carbon Manufactory. Price 1s. 6d., post free.

THE STEAM ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. BEAUMONT. Price 2s. 6d., post free.

FULL CATALOGUE POST FREE ON APPLICATION.

"ELECTRICIAN" SERIES FORTHCOMING BOOKS.

THE ELECTRIC ARC.—By Mrs. AYRTON. This work is in the press, and will contain an historical sketch of the early experiments on the electric arc, as well as the important results of recent research.

PRIMARY BATTERIES.—A work on this subject will shortly be published bringing the theory and practice of the Primary Battery up to date. The book will be fully illustrated.

SECONDARY BATTERIES.—By E. J. WADE. Fully illustrated. The Author in this work will deal briefly with the theory and fully with the chemistry, design, construction and manufacture of secondary batteries or accumulators.

"THE ELECTRICIAN" WIREMAN'S POCKET-BOOK.—Edited by F. C. RAPHAEL. "The Electrician" Company will shortly publish a valuable pocket-book for the use of those engaged in wiring work, both external and internal.

THE TELEPHONE.—By DANIEL SINCLAIR and F. C. RAPHAEL.

SPECIAL NOTICES.

NOW READY.—Vol. XLIV. of "THE ELECTRICIAN" (950 pages), bound in strong cloth. Price 17s. 6d., post free 18s. 6d. Also ready, Cases for binding. Price 2s., by post 2s. 3d.

A complete set of "THE ELECTRICIAN" (1878-1900) can now be supplied. These sets are very scarce, and early application should be made.

NOW READY.—"THE ELECTRICIAN" READING CASE. Holds four copies of the Journal. Strongly made and corded for hanging. Price 1s.; post free, 1s. 4d.

ELECTRIC TRAMWAY POWER STATION DESIGN.

In a Paper recently read before the Tramways and Light Railways Association, Mr. PHILIP DAWSON discusses some general considerations governing the design of power stations for electric tramways. He confines himself to the economical aspects of the question, and, we may say at the outset, views the matter chiefly from the standpoint of a tramway engineer. The entire aim before him is to design a power station which will produce electrical energy at the cheapest possible cost. He does not believe that this affects the cost of distribution, stating that his experience in this country, as well as on the Continent and in America, shows that the location of a station on a site where power can be produced cheaply does not overload the outside expenses, provided that a proper system of transmission and distribution is adopted. The first question attacked in the Paper is the combination of a lighting with a tramway station. Differing in this respect from the speakers at the recent Municipal Association discussion, reported elsewhere in this issue, Mr. DAWSON views this essentially from the tramway company point of view, and consequently he is not in favour of such a combination. "The case is, however, entirely different," he goes on to say, "where traction and lighting are combined, and the best results are then obtainable, that is to say, "where a station has been designed by experienced traction engineers for traction and lighting." The considerations which lead him to this conclusion are chiefly that a lighting station has a very much lower load factor than a tramway station, the annual work of the former representing only three months continuous running at the most, whereas the annual work of a tramway station represents as much as 10 months or even 11 months. The tramway company pure and simple is not to be expected, therefore, to view with satisfaction the proposal to saddle its tramway station with a lighting load. We have always held the view that the addition of a lighting load to a tramway station is undesirable from the tramway point of view, whereas the addition of a tramway load to a lighting station is distinctly an advantage. It must not be forgotten, however, that, in the first place, lighting stations have had the start of tramway stations in this country, and, in the second

Digitized by Google

place, both lighting and tramway work is gradually falling into the hands of the same authorities, viz., the local authorities. Accordingly, the real question is whether it is better to have two independent stations—one for lighting and the other for traction—or to combine these in a properly designed station suitable for both kinds of load. We think that, when the question is faced from this point of view, there can be little doubt that the combined station is superior to the employment of independent stations. The combination gives a far more satisfactory load factor for the entire lighting and traction works than is obtained when the load factors are separated, and, to quote Mr. DAWSON again, "the cost of producing power varies with the amount to be produced, decreasing as the amount increases. This shows the advisability of concentrating as much power as possible in one station and reducing the number of units."

With regard to the vexed question of single *versus* multiple stations for tramways, Mr. DAWSON casts his vote in favour of the single station. He points out that in a large single station it is practicable to introduce labour-saving devices and refinements of plant to a much greater degree and with much better results than can be done in each of a large batch of small stations. This is undoubtedly the case; for whilst it will not pay to put in extensive coal-handling plant, in a small station for example, where only a few men are employed in the boiler department, the introduction of such appliances is abundantly justified in a large station having a great number of boilers. For a system requiring anything above 5,000 kw. Mr. DAWSON is inclined to the view that the polyphase system of generation and transmission with rotatory converter sub-stations is the best. As regards the size of the individual units these should vary, he says, from two sets for stations of 200 H.P. maximum up to 10 sets for stations of 90,000 H.P. maximum, the individual sets being of 200 H.P. and 10,000 H.P. respectively.

Referring to the general question of the design of power stations, we think it is abundantly clear that the time has come when engineers must recognise that such stations must be designed to undertake any class of work. Lighting is steadily becoming of secondary importance as compared with power work. Stations designed for power supply can readily undertake lighting if necessary, but the converse is not always the case. The tendency at the present day to extend considerably the area over which any one undertaking may supply electric power, as well as the grouping of lighting, tramway and power work in combined undertakings, shows that the design of large power stations in the immediate future will have to be on broader and more universal lines than hitherto. Engineers, that is to say, will have to take into account the fact that power stations are no longer merely lighting stations: that before long they will be not merely even combined lighting and tramway stations; but that the duty of a power station engineer will be to supply electricity on demand, at a steady voltage, without any questions being asked as to the purposes for which it is to be used. Few existing stations could bear this strain. Indeed, there are not a few central station engineers who would look askance on the rapid growth of a motor load on their mains, because this would seriously affect the steadiness of the lighting. Such a condition of things is not as it should be. Modern electrical engineering is capable of producing better results than these. Central station engineers, indeed, and especially those controlling extensive industrial areas, will soon be called upon to supply current without reservation as to its use. This, in fact, is the justification, on political grounds, of the large power supply schemes so much in evidence just now in Parliament.

COMBINED MANAGEMENT OF TRAMWAY AND LIGHTING DEPARTMENTS.*

BY R. C. QUIN.

(Borough Electrical and Tramway Engineer, Blackpool.)

It will be admitted, by all members of the Association at least, that the municipal authority should be the lighting and tramway authority also. So far the author begs the question, and in dealing with it purposes to treat it solely from the municipal point of view. It does not follow that because both undertakings are owned by the municipality that it is necessarily the best policy to combine generating stations. In the majority of cases this question can readily be settled; but in some the tramway area and lighting area, or perhaps the author might more correctly say their "centres of gravity," are far from coinciding, and it may then be advisable to have separate generating stations.

Assuming, then, that in our hypothetical town separate generating stations are established for lighting and tramway purposes—is it advisable to combine the two undertakings? In order to find a satisfactory answer to this problem we must first consider whether the undertakings are, to any great extent, of a similar nature. In both cases we must have an engineer fully conversant with the problems of economical generation and distribution of electricity, and lastly, but by no means least, one who fully realises the importance of continuity of supply. Whatever tramway engineers may say to the contrary, continuity of supply is of much greater importance with electric lighting than with tramways. Who then best realises that continuity of supply should be the first aim? There can, I think, be but one answer to this question: The lighting engineer. I have used the term "lighting engineer" because it is the term most generally used to denote the engineer responsible for the works established for the general supply of electricity, but the description is certainly not a correct one. A general supply of electricity is not established for lighting only but for the supply of power also, and what "lighting engineer" is not familiar with motors? What new problems does traction supply call into existence? The question of load factor certainly arises in the calculation of sizes of cables, also the various stresses in connection with overhead line and posts will have to be provided for, and the starting, uniform running, and stopping of the tramcars be ensured by suitable arrangements. But every one of these problems is simple and any engineer worthy of the name could readily solve them. From this it will be seen that, in the author's opinion, the man best qualified to design and work a traction system is the qualified central station engineer. But having two stations is it now necessary that we should have two engineers? Certainly not. In many towns multiple stations even for general supply are established, yet they are invariably under one chief engineer.

The next phase of the question to be considered is how far the engineering side of the question is dominant in a tramway supply. In the maintenance of the traction system there are several points to be considered and I will enumerate them as follows:—(1) The maintenance of generating machinery, (2) the maintenance of cables, (3) the maintenance of overhead line and posts, (4) the maintenance of track, (5) the maintenance of cars and motors, (6) the cleansing of cars, (7) the regulation of traffic, (8) the collection of fares. The first five are entirely engineering, and without due regard to them the tramway system must cease to exist. The remaining three, though important, do not require that technical skill and training, nor the exercise of such resource as do the former. Suppose then that we appoint, as chief of our tramway department, one who has previously been manager of a horse or other tramway system. How far is he fit and capable of efficiently controlling and maintaining the system? He is certainly competent to give due regard to the last three points (6 to 8); he might also have had sufficient experience to enable him to maintain the track. But his electrical knowledge would probably be extremely slight, and it would then be necessary to have an electrical engineer, who would become the servant of the tramway manager. We shall find ourselves in this dilemma, that we have placed the maintenance and responsibility for good working of the most important part of our system upon a servant, and placed over him a man incapable, by reason of his want of knowledge, of properly controlling him. The engineering side is without doubt the most important in a mechanical, and especially electrical, system of traction. But it may be said that the collection of fares, and regulation of traffic requires experience which the electrical engineer may not have. Granted that it may be so, it does not necessarily follow that the engineer would control this. These duties could be placed upon a traffic manager. As to whether this traffic manager would be the servant of the engineer is largely a matter of the personality of the two men; and to the author, there appears no difficulty whatever, and he speaks from experience, in thus separating a tramway system, though there are advantages obtainable by placing the whole system

* Paper read before the Municipal Electrical Association, at Huddersfield, June 21st.

Digitized by Google

under one responsible head. The question of collecting fares has some analogy to the collection of electricity or gas rents. In most towns, the author believes, this is not done by the electrical engineer, but by a separate department of the municipality. What the author would most wish to impress upon his readers is the fact that the design and working of an electric traction system is almost entirely an engineering problem, and that the man best qualified to carry out this work is the competent central station engineer.

The following is an abstract of the discussion on the above Paper:—

Mr. J. F. C. SNELL (Sunderland) said the matter was very important because the bulk of municipalities had to consider the question of traction, and many of them already had their lighting station. In the case of Sunderland the Corporation had combined the two departments and had one engineer; they had even gone a stage further than this, they had made the engineer not only the lighting and traction engineer, but also the general manager of the tramways. The engineer will have an assistant engineer for tramway purposes solely, who will take charge of the tram sheds and repairing shop and will keep the cars ready for placing on the track. The traffic manager will see to the motor-men, taking the cars on the track in the morning, and will have control of the cars for the time being. He will have to deal with the traffic and financial arrangements of the undertaking. As the engineering side of the department outweighed the other he thought the engineer-in-chief should have the greater authority, as they could not expect a non-technical man to take the duties.

Ald. G. PEARSON (Bristol) regretted that the Corporation had not bought out the tramway company in Bristol; he considered that by not so doing they had thrown away one of the greatest opportunities they had had in Bristol since he had been connected with it. He had considered the question of combination, and he felt that the right thing to do was to combine the electric lighting and tramway undertakings, and they should be in the hands of one committee to avoid friction. He agreed with Mr. Snell in the question of division of the department. He thought the electrical engineer should be responsible for the generation of electricity, the supervision of the tramways so far as the motors and overhead appliances were concerned, and the traffic manager should have control of the motor-men and collectors, and should arrange the times that the cars should run and have charge of the traffic. That was a simple way out of the difficulties of management, leaving the technical work in the hands of the electrical engineer and the business department in the hands of the traffic manager.

Mr. PHILLIP DAWSON (London) had found, when doing work in connection with tramways that it was much better to have one responsible engineer than to have two or more managers, as it was a difficult matter to please both gentlemen. There was not the slightest doubt that the corporation electrical engineer should have the whole superintendence of the installation.

Mr. S. E. FEDDEN (Sheffield) considered that if the tramways and lighting departments were divided there should still be one chief engineer who should also be general manager for both departments. He could then have a superintending engineer who should have control of the motor-men and engineering details, the track and the overhead work. The conductors and all matters relating to fares, &c., should come under the traffic manager, who should also be responsible to the chief engineer.

Ald. BRUCE (Sunderland) said it was an absurd position for any municipality to take up to have two stations, one for supplying light and the other power. This should be carried out from one works, and they should have one engineer. There was, however, two sides to the management, one the engineering and the other the commercial. At Sunderland they felt that they had a man who could advise them upon the electrical and engineering side, and the tramways committee had therefore appointed Mr. Snell as the engineer of their department, thus minimising the difficulties of two committees by having one engineer for lighting and tramways.

Ald. WOODHEAD (Halifax) was convinced that if they wished to work economically they must have a combined station; they would thus avoid the necessity of otherwise having two sets of men and two sets of duplicate plants. He thought the electrical engineer should have charge of everything electrical, and the traffic manager should be responsible for the traffic and the rolling stock so long as it remained capable of doing its work. In Halifax they had a tramway manager who did not interfere with the electrical portion of the business, and they had their electrical engineer. They had run without a hitch, and they had an Electricity committee and a Tramway committee, and he thought they should not be one committee.

Mr. W. R. WRIGHT (Burnley) asked Mr. Quin who had charge of the track.

Mr. H. C. BISHOP (Wigan) said they had a combined committee for lighting and tramways. They had started with a clear field and had a combined station. He considered it was the proper thing to do when they had not already a lighting works, but when they already had one works the matter was not quite as simple. He considered, however, that in any case they should have one chief engineer, who was responsible for both departments.

Mr. C. S. VESEY BROWN (Lincoln) would recommend the matter to be left to three sub-committees, viz., "Generation," "Distribution," and "Financial." He agreed that in large cities such as Glasgow, Liverpool, &c., there should be two works. He thought the question of whether there should be one or two stations depended upon local circumstances.

Mr. R. C. QUIN (Blackpool), in replying, stated that he thought the electrical engineer should be the chief, and that all others should be responsible to him. He thought, however, the management of the traffic and collection of fares, &c., should be left to a traffic manager. In answer to Mr. Wright he said that the Electric Lighting and Tramways committee lay the track, pave it, and repair it.

PROJECTED COMBINED ELECTRIC SUPPLY AND TRAMWAY WORKS FOR WILLESDEN.

The following are the full details of a scheme (briefly referred to in our issue of July 13th) for a combined electric supply and electric tramway works in the district of Willesden, near London, as set forth in the report and supplementary report of Mr. E. T. Ruthven-Murray, electrical engineer to the Willesden District Council. The scheme was passed in its entirety on Tuesday by a unanimous vote of the Council. Mr. Ruthven-Murray's scheme is of considerable importance, and is, moreover, the first in this country in which it has been definitely proposed to employ "double-current" generators, generating both three-phase and continuous current:—

. . . Nothing has been more remarkable than the almost spontaneous manner in which demands for electric light and power have been made where an efficient supply of electricity has been available at a reasonable cost. The consequence has been that, where works have been laid down without full appreciation of this fact, it has been necessary to extend them within a very limited period. As a single instance I may cite the case of a works designed by one of our most eminent consulting electrical engineers on the basis of a probable lamp connection of 7,000 in three years. Already, nine months after the works had commenced operations, 7,000 lamps had been connected; and at the end of three years, instead of 7,000, over 25,000 lamps were on the mains. In several instances where municipal electricity works were being laid down on what were thought to be liberal lines it has been necessary to order plant for extensions before the works were opened, and this has proved necessary in the most unpromising areas. Again, the chosen site has sometimes been unsuitable, or it has been impossible to extend the buildings, and, therefore, the original site has either been abandoned or superseded, and extensions have taken the form of entirely new works designed with more consideration for the districts requirements. It is manifest that alterations such as these must involve the waste of a large amount of capital, and thereby increase the future cost of production. . . If you decide to commence operations with works which will not be outgrown in a year or two, a course which I strongly recommend, you should clearly understand that the undertaking may not be sufficiently remunerative to pay all capital charges over and above working expenses for two or three years, but the increased profit when the works are loaded to a fair proportion of their full capacity will more than compensate for the deficits which will have to be met at the commencement.

. . . The compulsory area scheduled in your provisional order is somewhat unusually large, amounting as it does to nearly 5¼ miles of roads and streets, of which the farthest scheduled points are no less than 4 miles apart. . . I divide Willesden into three approximately equal sections, each of about 2¼ square miles in area. In one section the electricity works are located, and a transforming and battery sub-station will be necessary in each of the others. But for the present, and until the Neasden and Dollis Hill districts are developed, only one sub-station is required. The sub-stations will be depôts from which all outside work in the district in which they are situated will be controlled. Throughout the district, supply to consumers will be given from low-pressure distributing mains, fed with continuous current from both generating works and sub-station. The sub-station will be supplied by means of three-phase extra-high-pressure current, which will there be converted to continuous current for distribution. The scheme is designed not only to supply the entire district with energy for both light and power, but, if need be, also to operate tramways, either within or without the Willesden district, with the maximum of economy and efficiency. The combination of high-pressure-alternating-current transmission with low-pressure continuous-current distribution, already described, will fulfil these requirements.

. . . The total length of the distributing mains I recommend you to lay amounts to 15·03 miles. . . .

I recommend you to declare 240 volts as the consumer's pressure and to lay the mains on the three-wire system, so that a pressure of 480 volts is available for the larger motor works. By adopting the three-wire system of distribution a further economy in conductors results, as the "outers" are fed from the works at or somewhat above the pressure of 480 volts. I may also point out that the standard pressure for operating electric tramways is 500 volts, and the choice of a nearly similar pressure for the purpose of general supply enables dynamos to be constructed so that they may be used interchangeably on lighting or traction circuits. This promotes economy in capital expenditure. . . .

I have so calculated the sectional areas of the distributors that these cables will suffice for the probable demands for some years to come, but as the need arises additional feeders will be run from the works or sub-stations to new feeding points. At present five feeders are provided. . . . The connection between the feeders and distributors is made at a feeding point in a cast-iron box placed below the pavement. . . . I advise that all your mains, both high tension and low tension, be laid on the solid system. The extra high-tension feeders between the electricity works and the Salusbury-road sub-station will probably be laid in iron troughs or casings, the feeders and low-pressure distributors in wood or stoneware casings filled with bitumen.

. . . The Taylor's lane site is most suitably placed. It is about 3¼ acres in extent, approximately 600ft. by 250ft., adjoins the Midland and South Western Junction Railway, and indeed possesses in a greater or less degree the whole of the advantages set out above. The canal feeder from the Welsh Harp reservoir flows past the site at a small distance, so that, if at a later date the canal company reconsider their terms, we shall be able to obtain water from this source for condensing and boiler-feed. . . .

Digitized by Google

. . . The works buildings take the form of a rectangular block, in which the boiler house, the engine house, and also the wing containing the battery room, offices, workshops and stores, are all parallel to each other. The railway siding will be constructed outside the boiler house, so that fuel may be discharged, through the doors provided, directly on to the stoke-hold floor in front of the boilers. The coal trucks will be moved by means of an electric capstan. At first the portion of the boiler house not required for other purposes will be employed for the storage of coal, and a temporary line of metals will be carried into the building for convenience in unloading the trucks.

The boiler house is 126ft. 9in. in length by 52ft. in width, and will take boilers having an aggregate of nearly 5,000 H.P. An 18in. gauge tramway will be laid along the stokehold floor, and by means of small skips, running on a similar tramway below, the clinkers and refuse from the boilers will be removed. The main flue (7ft. by 9ft. section) and the auxiliary flues, as well as the economiser chambers, will all be below ground level. The pump room is situated at the northern end of the boiler house. The floor is constructed on an iron and concrete platform bridging the main flue, so that there may be no risk of this being damaged by vibration from the pumping machinery above. Feed-water tanks are situated within the boiler house adjoining the pump room.

For the boilers to be erected at present about half of the boiler house will be required.

The chimney shaft, octagonal in plan, is 9ft. internal diameter at the top, and 180ft. in height above ground level. It is designed to take the gases, with natural draught, from the whole of the boilers arranged for in the full boiler house.

The engine house is 126ft. 9in. in length by 45ft. in width. A passage 10ft. in depth by 4ft. in width is carried below floor level adjoining the division wall between the engine and boiler house. This is provided to receive the condenser circulating water pipes. An under-floor passage 9ft. by 6ft. section, with access from the battery room, is constructed to receive all conductors and cables leading to and from the switchboard situated above it. An office for the engineer-in-charge is built in the north-west corner of the engine room, and a staircase at the side, and over this, gives access to a gallery from which doors connect with the offices and rooms on the first floor of the west wing.

The west wing contains, in the basement, the battery room with entrance by staircase from the engine room, and from the yard by way of a dry area. In this basement are also a household coal cellar and a heating chamber. On the ground floor are men's mess room and lavatories, an engineer's workshop measuring 29ft. 6in. by 16ft., general stores, engine stores, cable and outside stores, and carpenter's workshop. On the first floor are cloak room and lavatories for the staff, chief engineer's office, committee room, assistant engineers' mess room, photometer and meter testing room, meter stores and an additional store.

These stores and offices should still prove adequate after the works have been considerably extended, but I consider it of the greatest importance to build the necessary complement of offices and stores at the outset, as, without a place for everything and everything in its place, it is impossible to attain to the highest economy and efficiency in working.

The boiler house, flues and chimney shaft have been designed for about twice the boiler power now recommended to be laid down. The mechanical stokers will at present be charged from skips holding about 5 cwt. each. These will be combined with portable weighing machines, so that an accurate record may be kept of the fuel consumed, a matter of the utmost importance, as providing a check upon the efficiency of the steam-raising and steam-using plant.

I recommend the use of boilers of the water-tube type on account of the small space they occupy, their quick-steaming capabilities, their suitability for safely carrying high-steam pressures, and the facility and low cost at which repairs, if needed, may be executed. Repairs are practically confined to the occasional renewal of the tubes subjected to the direct action of the furnaces. Perhaps the greatest advantage this type of boiler possesses is to be found in the rapidity with which steam may be raised, and raised with safety. The important bearing this has on the cost of working will be realised if I point out that a very large proportion of the total fuel consumed in an electricity works is used in raising steam and not in making of steam, and that a boiler containing a large volume of water will require the expenditure of much more fuel to raise steam than one containing less. The objections generally advanced against this type of boiler are that it is expensive to clean, that the small steam and water space results in unsteadiness of steam pressure, and the bituminous coal cannot be burned without making smoke. I have made preparation to overcome these deficiencies, or rather to add to the advantages possessed by the water-tube type of boiler in the following manner :—

I recommend the use of mechanical stokers to enable bituminous coal to be burned without the production of smoke, although not alone for this reason, but also because by their use an increased evaporative efficiency will be obtained. Mechanical stokers on water-tube boilers are now giving satisfaction, as the fuel consumption may be varied within wide limits without the emission of smoke.

In order to obtain the highest efficiency from the steam-raising plant, and, at the same time, to improve the steadiness of steaming under varying loads, I recommend that economisers be fixed in chambers between the boilers and the main flue. In these the feed-water will be heated to a temperature somewhat above boiling point by the waste gases on their way to the chimney. At the steam pressure I recommend, the gases will enter the economiser chamber at from 500°F. to 600°F., and should leave at about 300°F. to 350°F., a large proportion of the difference between these temperatures having been imparted to the feed-water.

In order to reduce the cost of cleaning the boilers and economisers I propose to purify and soften the feed-water in a water-softening plant before it reaches the feed-water tanks. It should then be possible to use the boilers for lengthy periods without cleaning them. The total saving of fuel and in the cost of cleaning by this means will be far greater than the interest and sinking fund on the cost of the plant, plus the cost of softening the water. One-sixteenth of an inch of scale in a boiler has been found to increase the consumption of fuel by no less than 10 per cent., but it is difficult, without injury to a boiler, to chip off the scale until it has attained a thickness even greater than the above. . .

At the present time I recommend that four boilers be installed, one having an evaporative capacity of 5,600lb., and three of 12,500lb. of water per hour from and at 212°F. These would be set in pairs, with a passage 4ft. in width between them, so that a steam jet may be used for blowing the deposit of soot off the tubes. Each boiler will be provided with a full complement of fittings, in addition to the mechanical stokers. All the stokers will be operated from a shaft running below floor level, driven by an electric motor. Each pair of boilers will be equipped with an economiser which, as before stated, will intercept the gases on their way to the main flue. I have so arranged these economisers that, in the event of repairs being necessary, only one need be out of service, and so that, if more than a pair of boilers are under steam, the feed-water may be heated in another economiser and supplied to any boiler. This overcomes the difficulty experienced in the usual settings of economisers. Each economiser will contain about 6,000lb. of water. The tube scrapers will be operated by electric motors.

I recommend a working steam pressure of 180lb. per square inch, that the boilers and economisers be built for 200lb. working pressure, and that each boiler be fitted with a superheater capable of imparting not more than 100°F. of superheat to the steam. Superheating, if not carried so far as to interfere with the satisfactory lubrication of the engines, results in an improved efficiency owing to the steam being in a thoroughly dry, gaseous state.

Feed-water will be obtained from the water company. Before passing to the feed-water tanks, placed below the pump-room floor level, it will flow through a feed-water heater and the softening plant. The feed heater will take the exhaust steam from the feed pumps and from one engine.

For feeding the boilers two steam pumps and one electrically-operated pump are provided. They will be used under different conditions of load, according as one or the other proves the more economical. All feed-water will pass through a water meter before entering the economisers. The steam piping will be constructed entirely of mild steel. . . .

In the engine house a similar provision for extension to that allowed in the boiler house has been made, so that the plant provided for in this scheme occupies about half the total available space. . . . The four dynamos will be multipolar double-current machines. They will generate either continuous current, to be fed direct to the low-tension distributors, or three-phase currents, which may be transformed up to high voltage for transmission to the sub-station. The same dynamo can therefore supply, either simultaneously or separately, any proportion up to its full output of continuous or alternating current. By this means, under certain conditions of load, both adjacent and distant parts of the district, as well as electric tramcars, may be supplied from one steam dynamo. Each double-current dynamo will be of 250kw. capacity. They will generate continuous current at 480 volts to 580 volts pressure, and three-phase alternating current at from 290 volts to 350 volts, and 25 periods per sec., and will be of the revolving armature, multipolar type. . . . I recommend you to adopt the high-speed enclosed type of engine, . . . of the three-crank triple expansion type.

In order that the double current machines may supply the high-tension circuits, three variable ratio transformers each of 250 kw. capacity and a motor generator of 100kw. capacity are provided. The employment of the latter will often save running a second engine.

The switch gear for controlling the supply and distribution of electricity will be mounted on a switchboard to be erected on the fireproof gallery built parallel with the west wall of the engine room. This has been carefully designed to secure safety and convenience in working. It will be raised some 8ft. above the engine-house floor level, and the electrical connections at the back of the board will be 4½ft. clear from the wall, thus allowing ample room for safety in working. The switch gear will be operated from the front of the board, from which the whole of the machinery will be in view.

A balancing transformer set and a pair of booster dynamos for battery charging will be fixed beneath the switchboard platform.

For erecting and overhauling plant an overhead travelling crane capable of lifting 15 tons will traverse the length and breadth of the engine room. This crane will be suitable for conversion to an electrical power crane if this should be desirable in the future.

A large storage battery, already referred to, comprises part of the works equipment, and provision is made to double its size. This will be erected in the room specially built to receive it. The purpose of the battery will be to assist regulation and to supply light load demands such as may occur after midnight and during a portion of the daytime. . . . I have made every provision for condensers, water cooling towers and feed storage tanks, the value of such plant being essentially greatest when the engines are running under-loaded.

The site chosen for the sub-station is about 75ft. by 165ft. in area, and will accommodate an office block in addition to the sub-station buildings. The offices contain waiting and show room, clerks' and accountant's office, chief and assistant engineers' offices, and assistant engineers' and caretaker's quarters. A commodious basement will provide convenient storage for service-layers' tools, junction boxes, and other plant required for the execution of outside work. . . . The sub-station buildings comprise transformer basement, motor-generator room, battery room, drawing office, and test room, meter and cable store.

The extra high-pressure feeders for the works will be brought directly to the switchboard situated in the motor-generator room. This switch-

Digitized by Google

board will be built 4ft. clear from the battery room wall, and the switch gear will be operated from floor level. The incoming three-phase current will be converted to continuous current in motor-generators, from whence, through the low-tension feeders, the distributors will be supplied. My scheme provides for four sets of motor-generators, one 50kw., one 100kw. and two 200kw.

For maintaining the balance on the three-wire system a balancing motor transformer will be provided. At each end of this machine a booster dynamo will be coupled, to assist in charging and discharging the battery, or, if required, to raise or lower the pressure on any local feeder.

A 10-ton hand-power travelling crane is arranged to traverse the motor-generator room.

I propose to instal in the sub-station a storage battery capable of supplying 4,000 8 c.p. lamps for two hours, or 1,000 lamps for 10 hours. This will permit the whole of the machinery to be shut down daily for probably 18 hours out of the 24, for at least a short while after the works are opened.

The candle-power and distance apart at which arc lamps are erected varies in different localities and with the need for lighting. In the principal streets of large cities and towns, arc lamps of 2,000 nominal candle-power, consuming ½ unit per hour, are spaced about 40 yds. apart; in residential districts they are frequently spaced from 70 yds. to 90 yds., and ever farther, apart. I believe that in a neighbouring parish, where there is a large amount of arc lighting, 80 yds. has been chosen as the standard spacing best suited to their needs. Except in the High-road, Kilburn, I do not think 80 yds. apart an excessive distance for you to place your arc lamps. The existing gas lamps are about 40 yds. apart. The Board of Trade require the trolley posts, used in connection with overhead electric traction, to be not more than 40 yds. apart; and, therefore, if these are available for supporting street lamps, you could adopt 80 yds. now, and at a later date, should the increased importance of the street justify it, an alteration to 40 yds. could be made by doubling the number of lamps.

I append a list of the streets and roads in which I recommend you to provide arc lamps. Those in the High-road, Kilburn, should be kept alight all night, but in the other roads I would recommend that the arc lamps be extinguished at midnight, and substituted by either two 32 c.p. or four 16 c.p. incandescent lamps. The annual cost of each lamp, based upon the charges for current recommended later, would be: For 2,000 nominal c.p. (10 ampere) arc lamps, burning all night, including carbons, trimming, attendance and repairs, £29. For similar lamps burning until midnight, to be then replaced by incandescent lamps as above described, £21. 10s. These prices are based upon the charge for current averaging only 2·69d. per unit.

I do not submit proposals for immediately lighting any street by means of incandescent electric lamps, but I suggest the matter as one worthy of careful consideration. The total number of arc lamps proposed is 94 (14 all-night and 80 half-night, the latter each with two substitutional incandescents) and the total annual cost £2,126.

With the exception of two lamps, the whole of the above streets and roads in the list are now lighted by means of incandescent gas. By adopting the above scheme of electric lighting 171 incandescent gas lamps will be released for use in other parts of the district. The present cost of gas lighting amounts to £524. 9s. 6d., so that the extra cost of the electric lighting would be £1,701. 10s. 6d. Thus, for four times the cost, the illumination would be increased about 150 times.

ESTIMATE OF CAPITAL EXPENDITURE.

Land, Railway Siding, and Buildings—			
Land, including charges incidental to acquisition...	£3,976	0	0
Railway siding	2,500	0	0

Meters and house connections (first year)	3,000	0	0
Total	£138,102	0	0
Add for quantity surveyor's charges & contingencies	5,522	0	0
Grand total	£143,624	0	0

(To be concluded.)

* If trolley posts are not available for the attachment of lamps, add £1,500.

THE ELECTRICAL ENGINEERS (R.E.) VOLUNTEERS AT THE FRONT.

Reports from South Africa refer to the valuable services rendered by the Electrical Engineers (R.E.) contingent, under Major R. E. Crompton. When the Railway Pioneer Regiment was engaged in repairing the Bethulie railway bridge the electrical engineers volunteers fitted up search lights and arc lamps, in order that the work might be carried on at night-time. In other places also the search-light contingent has given great assistance, and has, it is said, been specially praised by Lord Roberts. The following is a letter received from a member of the corps. The action referred to is that of Leeuwspruit.

Near Vaal River, Friday, June 21, 1900.

It was hard lines. We were under orders to go from here (Vaal River) to Pretoria, when we had to come back again to repair the bridges which had been blown up a second time. We were getting on merrily with the work, and, in fact, were talking of going home, when on Thursday, June 14, at 2.30 in the morning, while we were all asleep, the Boers attacked us. The first intimation I got was a nigger jumping into the truck on the top of me. I woke up and shouted him to clear off, but he cried with terror and would not budge, then I realised what the curious crack, crack, meant going on all round me. I soon jumped out and got my rifle and ammunition, I can tell you. The Boers, we found, were ensconced on a kopje about 80 yards away, and under good cover, they poured in a heavy fire. We could only fire when we saw a flash. The kopje they were on was on one side of the train, so we all lay down on the other side and fought them, but presently they worked round to our side, and so had us practically surrounded. They fired several volleys from here, wounding several of our men. The Boer Commandant then sent in two of our men they had captured earlier in the fight and told us, through these men, that we were to surrender at once or they would blow the train to bits. We refused to surrender, and then the order came "E.E.'s in extended order on the veldt." We soon got into line, there were only 20 of us, and about 18 yards between each man. We then fixed bayonets and moved to rush the kopje on our side of the train. It was a trying time, I can tell you. We got the order "Advance!" from the left." I was left-hand man, which meant I was the first to rush. First I, then the others, rushed 20 yards at a time and then lay down. When we were about 50 yards from the kopje we all rushed forward, but the Boers did not wait for the bayonets, they had cleared.

We had to lie on the kopje for four hours, in point of fact, until daylight; bitterly cold it was too, and the worst of it was we had to take off our great coats on account of their colour and the brilliancy of the moon. As daylight came on we heard the welcome sound of big guns coming to our rescue, and as the day broke we saw our cavalry coming over the hills. I cannot imagine a prettier sight than those cavalrymen coming over the hills with the first light of day. If they had not come up, the Boers would have seen how few we were and would most likely have rushed the position and captured the train.

On our train there were altogether about 100 men and a lot of niggers, who were very much in the way. A lot of the men had no rifles—could not find them in the dark—so, you see, our fighting force was very small. However, we *defended* and *held* our train alone. When, however, all was quiet and the roll was called, we found we had lost rather heavily. Bigge was wounded through the neck and Mecklem through both ankles. There were seven missing, whose names are Colson,* A. Charlton, G. Charlton, Peart,* Landon,* Sellon* and Warder, so, you see, out of the 24 who went into the fight, we now have only 16. It is terrible to think of the treatment our men who are prisoners will get unless, as I hope, the accounts we get hold of are exaggerated. Altogether on the train there were two killed and seven wounded—the Boers must have been bad shots—and about 40 wounded niggers. Poor Bigge was quite near me when he was hit in the neck; the bullet just missed his spine, but he is now doing well. I don't know how I did it, but I managed to kneel down and bandage his neck up with my field bandage; it was a queer feeling though, with all the bullets flying around you.

The Major called us on to parade next morning and said he was awfully pleased with us. I don't suppose the papers will get hold of much news of this fight as the telegraph line was broken, and by the time it is repaired the whole affair will have been forgotten. The Major was simply grand under fire—as cool as a cucumber. He walked over to me while on the kopje and asked me how I felt; I told him, of course, that I was all right. I shall never forget it though to hear the bullets going with their incessant ping over your head, many of them hitting the ground close beside you. It was much worse, too, from the fact that they fired a lot of explosive bullets. They are frightful things. However, there were three Boers killed and 18 wounded, so we did pretty well.

We have now built up the bridge again and are on the road to Pretoria. I don't exactly see what there is to keep us there, however, as we are daily expecting orders to return home.

Another thing I must tell you; throughout the fight I had on a Balaclava helmet. Fancy the pictures you see of men fighting in ordinary helmets, &c., and then poor me to have to go into action in the romantic (though very unmilitary) helmet knitted of khaki wool. I was very glad of it though, as I should have been frozen without it.

Pretoria, Sunday, June 24.

Arrived here all safe to-day. Will write again soon. Best of health still.

* Colson, Peart, Landon and Sellon were, as announced in our last issue, among the prisoners unconditionally released and reported at Ladysmith.

CORRESPONDENCE.

A SPARKING PHENOMENON.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: The No. 1,156 of *The Electrician*, July 13, 1900, p. 441, contains under the column "Contemporary Electrical Science" an abstract of a Paper by W. T. Humphreys (*Phys. Review*, May-June, 1900) on a "New Sparking Phenomenon." The original Paper not being at my disposal, I do not know whether the author himself has chosen this title or not. In any case I should like to draw the attention of your readers to the fact that the experiment in question is not new, but is already described by H. Hertz in the supplementary note, No. 8, at the end of the second volume of his complete works, p. 271 of the English translation by D. E. Jones. Hertz says (I quote the English translation just mentioned): "... Again, let a Töpler-Holtz induction machine, with a disc 40cm. in diameter, be turned rapidly so as to give sparks having a maximum length of about 15cm. Now draw the poles 20cm.-25cm. apart, so that the sparking entirely stops; it will now be found that a long crackling spark can again be regularly obtained every time a small spark is drawn from the negative conductor either with the knuckle of the hand or with the knob of a Leyden jar; or the negative pole may be connected to a long conductor, and sparks may be drawn from this with the same result. The 'releasing' spark may be quite short and weak; if it is drawn with the knob of a Leyden jar, the jar only appears slightly charged. The same effect cannot be obtained by drawing sparks from the positive pole. The phenomenon must have been often observed before, but I have not found any mention of it in the literature on the subject.

"I can give no explanation of these phenomena. They clearly have the same origin as the phenomena which Herr G. Jaumann has described in his Paper entitled 'Einfluss rascher Potentialänderungen auf den Entladungsvorgang' (*Sitzungsberichte d. Akad. d. Wissensch. zu Wien*, Bd. 97, Abth. IIa, July, 1888). Herr Jaumann arrives at the conclusion that 'not only the form, condition, and potential difference of the discharge field,' but also 'the manner in which the potential difference alters—probably by its rate of alteration—materially influence the discharge.' It is to be hoped that these phenomena will be further explained."—Yours, &c., J. VON GEITLER.

Prague, July 21.

[I am much obliged to Ritter von Geitler for pointing out this claim to priority, which appears to be complete. It is strange that Hertz's description should have escaped my own as well as Mr. Humphreys' recollection. Mr. Humphreys uses almost the very words of the last sentence in the first paragraph above. It is still more strange that no satisfactory explanation of this puzzling phenomenon should have been furnished within the last twelve years.—E. E. F. d'A.]

GAS ENGINE ELECTRIC SUPPLY STATIONS.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: We notice on pp. 467-468 of your issue of the 20th, that at the recent Convention of the Municipal Electrical Association it was stated, during the discussion on the question of the suitability of the gas engine as a means of producing electricity, that gas engine stations were a failure. This we think, though unfortunately true in one or two cases, is rather too sweeping a condemnation. Because a few stations have been unsuccessful for reasons which can be easily explained and obviated, it is hardly fair to argue that gas engine-driven stations must of necessity be failures. We notice that you refer to the Midland plant at Leicester, and it may interest you to know that we have recently completed four large engines there, as those originally supplied by us were not large enough for the increased demands of the station. As instances of other successful gas-driven plants put up by us, we may mention the Northwich Electrical Supply Co., where originally two, and now three, of our special electric light engines have been at work for some years, working up to 440 I.H.P.; 1,000 I.H.P. at the Blackpool Tower, 552 I.H.P. at the new Meat Market, Birmingham, 213 I.H.P. at the Rugby School Electric Lighting Co., and 208 I.H.P. for the Great Central Railway at Woodford. Our engines are also used extensively abroad, and are working at central stations in Madrid, Valencia, Caceres, Vigo, and Chioggia, in Spain; and in many towns in Italy. That there has been in the past a certain amount of prejudice against gas engines to live down cannot be denied, but if the number of orders on our books for engines for driving dynamos may be taken as a guide, we are rapidly getting over it. As a proof that a gas engine, when properly designed, is as reliable as a steam engine for long runs at full power, we may mention that one of our 150 H.P. engines coupled direct to a dynamo ran for 8,640 hours and 25 minutes last year out of a possible 8,960 hours, or 98·6 per cent.—Yours, &c., CROSSLEY BROS. (LTD.).

Manchester, July 24. D. H. Irwin, Director.

SINGLE-PHASE ALTERNATING CURRENT MOTORS.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: On page 481 of your current issue, in the discussion of Mr. Wilmshurst's Paper read before the Huddersfield Convention, you have ascribed to me the statement that "it sometimes happens that a motor is supplied which is not at all suitable for the periodicity." What I said was, that in view of the large number of periodicities in use, it is difficult to keep in stock such a number of different stampings, &c., as to give the *best possible* results for every periodicity, and that therefore it is necessary to design machines for an average set of conditions.—Yours, &c., W. LANGDON-DAVIES.

London, July 25, 1900.

PARLIAMENTARY INTELLIGENCE.

(*Continued from page 518.*)

LONDON COUNTY TRAMWAYS (NO. 2) BILL.

On July 19th the Earl of Camperdown's Select Committee of the House of Lords commenced consideration of the London County Tramways No. 2) bill.

Mr. FREEMAN, Q.C., said this was one to enable the London County Council to apply electrical working to those tramways which they already owned in the metropolis, or which they might from time to time acquire. At present there were actually laid in the metropolis about 115 miles of tramway, of which 72 had been already purchased by the Council; and by 1903 the Council would own nearly the whole of the lines. The Tramway Act of 1870 gave public authorities power to purchase but no power to work lines. The Council in 1896 obtained an Act giving them power to work. In the present session they were promoting two bills. The No. 1 bill took power to couple up the various tramlines in London into one complete system, and No. 2 bill sought authority to apply electric power. The overhead trolley system would obviously be quite unsuitable for the streets of London, as it was very disfiguring and required the use of a great deal of private property; and it had been agreed that it should not be used in the metropolis except with the consent of the local authorities. The conduit system, though it involved considerable interference with roads, once laid, worked smoothly and without inconvenience, and this system the Council proposed mainly to adopt. The surface contact system, where it had been tried, had proved a success, and it was proposed to adopt it in certain portions of London in order to ascertain whether it was better than the conduit system. Of petitions against the bill those of the Lambeth Vestry and Wandsworth District Board dealt with much the same matter, and he would therefore take the Lambeth one. Lambeth objected that their rights would be injuriously affected, and claimed really an absolute veto as to the system to be used. That, however, was a matter for the Board of Trade to decide. There were 40 local authorities, and this bill affected 33 of them, but all except the Lambeth and Wandsworth authorities had consented to the Board of Trade being the final arbitrators. The only other petitioners were the Lambeth Water and South Metropolitan Gas Companies, who raised two points. First, they were afraid of the action of electrolysis upon their mains. The answer to this was that an important committee sat on this question of electrolysis in 1893, and drew up certain standard clauses which they recommended should be inserted in all bills dealing with electricity. Those clauses had been inserted in this bill. Then these two companies asked that in all cases they might do the road work themselves. That was a clause point. The same remark applied to water and gas companies as applied to local authorities.

Mr. PEMBER, Q.C.: The Lambeth Company is taken as a test case.

Mr. FREEMAN: Then there was only one other point, and that was raised by the vestries. They said certain generating stations were going to be erected from which electricity would be conveyed by cables to the tramways. When those cables ran through the streets the work of refilling, digging the trenches, &c., must be done by somebody. The County Council proposed that it should be done under the Tramways Act;

Digitized by Google

the local authorities said they would rather it were done under the Electric Lighting Acts. The County Council did not care so long as there was uniformity in the matter.

Sir ALEXANDER BINNIE, engineer to the London County Council, said it was very important that the tramways should be worked as a whole, with one mode of traction. If an isolated district such as Wandsworth or Battersea were to acquire control of the mode of traction in their particular district they might interfere very seriously with the general communications with other districts. South of the Thames the Council worked the trams they owned; North of the Thames the North Metropolitan Tramways Co. leased the trams which the Council owned. The Council had expended on the tramways, he believed, about £817,000 north of the Thames and about £887,000 south of the Thames. It is clearly in the public interest that the tramways should be in one hand and that there should be one system. He agreed that under the Tramways Act, as proposed in the bill, the Council, without any notice to the South Metropolitan Gas Co., would have power to interfere with roads. The practice, however, was to permit the companies to do the work. He did not see much objection to legalising the practice. There was a tramline through Wandsworth on which it was proposed to make some experiments, but he did not know that special protection other than that provided by the jurisdiction of the Board of Trade was needed. The clauses in the bill with regard to roads, &c., were the model clauses slightly modified to suit certain local authorities, but nothing was inserted to make them more restrictive of the powers of road authorities.

Mr. J. W. BENN, L.C.C., said as a result of a conference attended by 18 or 19 out of the 40 London local authorities, a code was embodied in bill regulating all the tramways; and it was the desire of the Council that there should be no exception made in favour of a particular district. The advantages which the County Council anticipated from the proposed change from horse to electrical traction were increased speed, increased profit, and lesser amount of room occupied by each tramcar. Each car holds 64 persons, and would occupy 5ft. less space than the present horse cars, which accommodated only 40 persons. The Council would not, under the bill, be able to introduce a new system without the approval of the Board of Trade. The surface contact system, to which Lambeth objected, had been tried with success. As a matter of policy he did not agree that there was no objection to legalising the present practice as to the method of dealing with mains. The Council thought the existing law and the model clauses already afforded the companies sufficient protection for their mains. At present the Wandsworth Board had a right of veto regarding the system of traction to be adopted in their district; but he did not think that should continue because they might interfere with the whole scheme.

Prof. A. B. W. KENNEDY said he had reported to the Council as to the advisability of adapting the tramway system of London to electric traction, and subsequently he prepared plans. He advised the Council not to bind themselves to any one system, but to leave the matter to the Board of Trade. Whichever of the two systems (the conduit or surface contact) was adopted, it would in no way interfere with the traffic passing over the roads. The contention with regard to electrolysis was amply met by the insertion of the model clauses drawn up by the Joint Committee of the two Houses of Parliament in 1893.

The CHAIRMAN: The clause says electrical powers shall be used only in accordance with the Board of Trade regulations. Therefore the Board of Trade will satisfy itself as to whether these pipes and things are going to be injured.

Mr. POPE, Q.C.: And shall make such provision as shall secure their safety if they are injured.

The CHAIRMAN: Quite so. That duty is thrown on the Board of Trade, not on us, and we are incapable of undertaking it.

Further examined, WITNESS said he knew of no injury done to gas or water mains by electrolysis since the Board of Trade issued the regulations.

The CHAIRMAN: Even if that had happened it would have happened under the regulation of the Board of Trade, and here is sub-section 7, which deals with such a case.

Mr. PEMBER said: Whatever injury might result from the insufficiency of the Board of Trade regulations, the water companies would get no compensation at all. He asked that if accident did occur under these regulations compensation should be given to the companies.

Mr. PEMBER asked Prof. Kennedy whether he thought the Board of Trade regulations were perfect, and would absolutely stop electrolysis.—He could not say they were perfect, but he thought they would practically prevent danger. They had been in use for a good many years, but he had not heard of any case of accident with the pipes.

Are you prepared to say that electrolysis may not be going on now, and not discovered; it would not be discovered till it had got to a serious point?—It is not discovered at once; but a good many years have elapsed. Until the escape of water became very serious the water companies would not discover the damage, and when discovered it would be a very expensive matter to set right if the pipes were seriously damaged. In most cases it would be clear to what cause the damage was attributable. In America a great deal of damage to pipes had been done by electrolysis; but the electrical arrangements in America were not subject to any body like the Board of Trade. Electric tramways were laid without any control at all so that what happened in America was no test of what would happen in England under Board of Trade regulations. Electrolytic action was caused by an escape of electricity meeting water and an iron pipe, in which case the water would decompose and the oxygen attack the iron. He agreed that the Board of Trade might sanction a system in which there would be uninsulated returns; but he was almost sure that would not produce electrolysis. The regulations of the Board of Trade of 1894 gave sufficient protection. He was aware those regulations were under review in 1898, but I believe the Board have not thought fit to alter their regulations.

Mr. CASTLE, Q.C. (for the South Metropolitan Gas Co.): That is the whole ground of our grievance.

Further examined: WITNESS agreed that a certain amount of leakage of electricity was allowed under the regulations, but not sufficient to produce electrolysis.

Seeing that you are asking for powers which may produce electrolytic action on our pipes, and seeing that you are working under regulations which you say are not absolutely perfect, do you see any reason why you should not give us compensation if you do us injury?—I have considered the question. The point is that we, as engineers to the work, have to construct our system according to the particular rules and regulations devised by skilled persons, officers of the Board of Trade, and we think if we carry out these things which are prescribed to us, honestly, and are looked after in carrying them out, we should not be held liable for further consequences.

The CHAIRMAN: You think that having done what the Board of Trade ask you to do, you ought to be free from further consequences, even although the result of the operations may be that these pipes are injured?—That is my view, because the Board of Trade have power at any time to strengthen their regulations.

Mr. CASTLE: I think you are going too far. You are bound to lay these tramways under the existing Board of Trade regulations; they have no future power over you.

Mr. WHEELER was proceeding to cross-examine with regard to the merits of the surface-contact system, which he said should not be left to the discretion of the Board of Trade to allow to be used, when the CHAIRMAN said the matter of a system of traction had nothing to do, in the judgment of the Committee, with the principle of the bill. The subject should be raised in clauses.

Cross-examined by Mr. Vesey Knox: The surface-contact system to be tried in Wandsworth would not be tried elsewhere until it had been found to be successful. He did not think precisely the same system of surface contact as was proposed to be tried in Wandsworth had been tried elsewhere.

This closed the case for the bill.

Mr. PEMBER addressed the Committee for the Lambeth Water Company, his contention being that it was not right to adhere to the particular part of the clauses of 1893. He asked for an amendment, making the tramways liable for damage so caused.

Mr. CASTLE said his clients were asking for protection from damage which might accrue to them under peculiar circumstances. This was the first bill in which Parliament had been asked to delegate its powers to a Department of the Government without retaining any sort of control on the part of the Imperial authority. The suggestion in clause 3 was that in future the County Council should act in connection with the system of electric traction to be used on these tramways with the consent of the Board of Trade. The matter of tramways was very similar to that of light railways, which in turn were similar to the question of the construction of railways. If anyone had had the audacity to come before Parliament and ask to make a railway, say, from London to York, on such and such a system, and according to such a method as the Board of Trade, apart from Parliament, might consent to, Parliament would have made short work of such a request, and yet it was what was being asked in this bill. Even when the Board of Trade permitted a scheme to be carried out under provisional order, it was always the rule that such an order should be confirmed by an Act of Parliament. But here they were asked in a most extraordinary way to deal not with what the Board of Trade had already done as in the case of a provisional order, but to sanction what the Board of Trade might do in the future.

The CHAIRMAN: Your contention is that the ordinary practice is at present for the Board of Trade to sanction an electric system, and for that system subsequently to come before Parliament for confirmation.

Mr. CASTLE: Yes, that was the arrangement he wished the Committee to make in this bill. If the Board of Trade authorised a system the opponents should be able to come to Parliament and say that the Board of Trade had erred, and the matter should be reconsidered by Parliament. The County Council came there and asked that what the Board of Trade might sanction in the future should have all the authority of an Act of Parliament. That would not be allowed in the case of any railway company making its own lines. For that reason he asked for protection in the shape of a compensation clause similar to that asked for and obtained by Mr. Pember. There were strong reasons why the County Council in these matters should not be allowed to shelter themselves behind the Board of Trade. If the compensation clause was not inserted he asked that the bill should be thrown out. His point was that this was an exceptional bill framed in an exceptional form, and he asked that it might not be passed without a compensation clause.

The CHAIRMAN: You do not offer evidence?

Mr. CASTLE said he might have to call witnesses as to the Council doing their own work if the bill were allowed to proceed.

Mr. WHEELER, Q.C., for the Lambeth Vestry, said his points against the bill were two, or possibly three. The first was as to whether they would not exclude the surface contact system; and the second—and this was a part of the bill which had hardly attracted any attention, although in many senses the most important part—who should have control over the Lambeth roads. Were the functions of the Vestry to be taken away from them and vested in the Board of Trade or someone else? The present bill entirely repealed the general law of the land, and he asked the Committee to say that in a private bill of this character that should not be allowed. The streets were within the jurisdiction of and governed and controlled by the various public authorities. That had been the law since 1855 under the Metropolis Management Act, and he maintained it was inconsistent with the general practice of Parliament that public acts should be repealed by private measures. The acts it

Digitized by Google

was sought to repeal were the 18 and 19 and 25 and 26 Victoria The second part of the bill was for applying electricity to the tramways, and counsel for the promoters suggested that they should deal with the bill as a whole and include Lambeth with the other districts. But if he (Mr. Wheeler) was right in his first point as to repeal, if they looked at clause 5, as amended, they would find that the Board of Trade was prayed in that matter—the road authority was saved, but was coupled with the Board of Trade, and he objected altogether to the interference of the Board of Trade. And he protested against the proposal—which would really be the effect of this part of the bill—that the Lambeth Vestry should be subjected to no fewer than nine kinds of arbitration. He would ask the Committee to lay down that that which had been common law for centuries, and which was crystallised by the Acts 18th and 19th, and 25th and 26th Victoria, should be carried out. It was true that there were 28 or 30 local authorities, but it was not correct, as alleged, that of that number only Wandsworth and Lambeth were objecting. In the first place, the vestries would cease to exist this year; in the next place, some of the local authorities were not affected; and, finally, the covenants of some districts had been obtained as a matter of barter—Clerkenwell, for instance. That district had originally opposed the bill, but it had withdrawn its objection. Why? Well, the County Council had consented to spend an enormous amount of money in widening the roads.

The CHAIRMAN: We have nothing to do with the motives of the local authorities. If the local authorities went against the view of the public the public had their remedy in being able to turn out the authority at the next election.

Mr. WHEELER said he should now call evidence.

The CHAIRMAN: As to what?

Mr. WHEELER: The unsuitability of the surface contact system.

The CHAIRMAN: We are not experts.

Mr. HENRY EDWARDS, surveyor of Lambeth parish, said the Vestry should not have their existing powers in the matter of breaking-up and repairing roads interfered with. There were practical difficulties in the way of having two authorities responsible for dealing with the roadway for some distance outside the tramway lines.

This was all the evidence for Lambeth.

Mr. HILL, clerk to the Wandsworth local authority, said that that authority last year had given their consent to the London County Council to make experiments in connection with both the conduit and surface contact system of electric traction. They had given a licence for 12 months, the idea being that it should not be renewed if it were found that the system of traction was dangerous or detrimental to the interests of the public. They had had powers of this kind in connection with the cable traction. The cable had been in use 10 years, which showed that the local authority were reasonable in the exercise of their powers. Such having been their attitude it would be unreasonable to interfere with the control of the roads by the local authority. The Wandsworth Board of Works thought they should have the ordinary control over the road operations in roads and streets along which trenches were made for carrying connecting electric cables. The local authority should have at least the electric lighting clauses applied to these trenches. The cost of carrying out the proposed electric traction experiment would be from £10,000 to £15,000 a year.

By Mr. FREEMAN: What objection have you to vesting the power of veto with the Board of Trade?—Because this is a matter affecting the surface of the road and the pavement. The surveyor to the Board of Trade is an electrical engineer, and he will be anxious to see this particular science of electricity advanced. He would be likely to attach more importance to science than to the convenience of the public.

In reply to other questions, witness said that if local authorities did not petition against a bill they were usually taken as agreeing to it. In this case he believed that some local authorities refrained from petitioning on the score of expense. He had not got an agreement with other local authorities in favour of the adoption of the road powers contained in the Metropolis Management Act, or in favour of the electric lighting clauses. He had communicated with 42 of those authorities, and the 14 who had replied had favoured the adoption of those powers.

Mr. MARTEN, surveyor to the Wandsworth Board of Works, gave similar evidence in opposition to the proposals of the bill. He thought the local authority should say what materials the roadway by the side of tramway lines should be paved with. He did not think that such questions should be settled by arbitration. There was no objection to going to the Board of Trade on the question of electricity, but he should object to going to them on the question of the surface of the roads. If any point were brought before them touching the surface of the roads, he should fear that they would attach too much importance to electrical questions in giving their decision.

Mr. VESEY KNOX, for Wandsworth, contended that is was not desirable that powers which a progressive body like the Wandsworth Board of Works had enjoyed for so long a period should be taken away. Wandsworth had been reasonable in connection with the cable experiment, which had only been tried in two London districts. They might be trusted to show equal reasonableness in connection with the proposed electric surface contact system. That system was not to be tried all over London, but only in two districts—Wandsworth and Lambeth. It was a system only known in Tours, in France, and Monte Carlo, and as it was an experiment he submitted that it was only fair that the Board of Works should preserve their existing powers. It might be found that the new line would be slippery for horses or otherwise inconvenient, and clearly it was only right that the Board of Works should have some check on the County Council. He only asked for power to check the progress of the County Council works for two years. He insisted further, that the Board of Works should be able to say what the material outside the tramway lines should be, and his third point was as to the laying of electric mains, as to which no one up to now had had very much experience. As a rule these mains were not necessary except along the tramway road itself and the same street as the tramway. But in the south of London there was a proposal to have a generating station some distance from the tramway, and communication mains would have to be laid going through other streets through which the tramways were not themselves to run. That was a state of things not contemplated by the model clauses and his clients contended that in these streets the promoters should be subject to the Metropolis Management Act or to the Electric Lighting clauses, under which they would have power at the expense of the County Council to fill in the mains. He thought it was only a reasonable proposition to make to the Committee that these powers should be allowed.

This concluded the case for the opponents.

After deliberation the CHAIRMAN (without calling on counsel for the promoters) said: The committee have decided that the bill may proceed.

On clause 3 an amendment was accepted, providing that where an electric system was proposed to be used for experimental purposes the Board of Trade should have power to prescribe the length of time for which the experiment should last.

On clause 4, which provides that the Council shall take all reasonable precautions in constructing, placing, and maintaining their electric lines, and so conduct their undertaking as not to injuriously interfere by electrolytic action with any gas or water pipes, Mr. PEMBER submitted as an addition:

"And the Council shall make full compensation to any company or person suffering loss or damage by reason of any such fusion or electrolytic action as aforesaid."

Council said his point was that the Council were the aggressors, that the gas and water companies were in the roads first, that their business was quite as important as, if not more important, than that of the County Council in regard to the trams from the public point of view, and that those who caused the damage should suffer, and not those who bore the damage.

Mr. BALFOUR BROWNE said he understood the decision of the committee in this bill would regulate the committee's decision on the following bill, in which the same point was raised.

The CHAIRMAN said that that must not be taken for granted.

Mr. BALFOUR BROWNE said he appeared for the Great Northern Railway Co., and he entirely concurred in Mr. Pember's statement. What the railway company feared was that these wires of the Council might be blown or otherwise caused to fall upon the signalling wires of the railway company. If they did surely the Council ought to pay for the damage.

Mr. CASTLE agreed with what Mr. Pember had said.

Mr. POPE (for the County Council) said this was a much more important point than it at first appeared. It was an attempt for the benefit of one water, one gas, and one railway company to alter the laws which regulated all such undertakings. The law was that if Parliament chose to give statutory power for the exercise of certain powers, so long as those powers were exercised without negligence, no liability for damage in regard to the exercise of those powers could be brought against the company at all. The Committee had already decided that statutory power should be given for the creation of electrical traction subject to the regulations of the Board of Trade, those regulations being incorporated as part of the conditions of the statute; and if anybody obtained those powers at the hands of Parliament and exercised them in conformity with the regulations of the Board of Trade and was not guilty of negligence in carrying them out, no claim for damages could arise, and there ought not to be inserted any provision for damages for the benefit of one gas and one water company.

Mr. BAGGALLAY said that was an error because the Lambeth case was a test case.

Mr. POPE said he would put the proposition in another way—viz., that for the benefit of the gas and water companies of London the Committee were to alter the general law in regard to the power of an undertaker who used his statutory power without negligence. The clause would make the County Council, if they used the powers the Committee proposed to give them, without negligence, liable in any event to pay for any damage done. The evidence was that there was no imminent danger of the kind, and that the Board of Trade regulations were sufficient to cover it.

The CHAIRMAN took exception to the last words. It had not been proved that the regulations were sufficient. It had been admitted that the regulations might be imperfect.

Mr. POPE said the whole question was threshed out before Lord Cross's Committee with the assistance of all the water and all the gas companies, and the result was that Lord Cross's Committee made a report in which they said that with proper regulations made by the Board of Trade the whole danger might be a negligeable quantity. Lord Cross's Committee, after hearing all parties, recommended that the clause should contain a compliance with the regulations of the Board of Trade, which should free the undertakers from any charge of negligence. The amendment now sought really meant that where undertakers were simply using statutory powers without negligence, they should, contrary to the general principles of law, be held liable for exercise of those powers. That would be a total reversal of all legal principles and of all Lord Cross said.

Mr. BAGGALLAY said Mr. Pope had been referring to the report of the Committee of 1893; but before Lord Cross's Committee of 1898 Sir Wm. Preece gave evidence and as a result that Committee directed attention to the observations he made as regarded the difficulty arising from the working of tramways by trolley wire, his suggestion being that a strong control clause should be carefully considered. Nothing, however, had since been done. His (counsel's) sole point was that if the Board of Trade made efficient regulations and they were obeyed the amendment would not hurt the London County Council. If the provisions made by the Board of Trade were effectual for the prevention of electrolysis and fusion the County Council would incur no liability. It was only in the event of those regulations proving ineffectual and damage resulting to his clients that they would be liable. In that case he contented that as between two

Digitized by Google

parties, one being wholly innocent and the other, however unintentionally, the cause of the mischief, the latter should pay.

Mr. CASTLE, Q.C. said if power were given to a Corporation by an Act, and no conditions were attached, it was very clear negligence must be proved before the Corporation became liable.

After consultation, the CHAIRMAN said the Committee had decided to admit the principle of the clause.

The parties proceeded to discuss the clause in detail, but eventually the matter was adjourned to enable the parties to bring up a substantive and separate clause.

On Wednesday, Mr. PEMBER brought up the following clause :—

"The Council shall make full compensation to any gas or water company suffering loss or damage by reason of any fusion of or electrolytic action on their mains, pipes, or apparatus which may in any way be caused by the Council in exercise of any of the powers conferred upon them by this act."

A long discussion followed.

Mr. POPE said the effect of the clause would be to make the London County Council insurers of the gas and water pipes of the Metropolis from any electrolytic action arising from any cause whatever. Though possibly this matter was not one of very great pecuniary consequence to the London County Council, because they did not propose to use a system which could result in electrolytic action, as a matter of principle the question involved was very important, being to what extent the Committee would alter the general law in this particular case.

The CHAIRMAN said the intention of the Committee was not, by giving the Council statutory power, to exempt them from anything in regard to what they would have been liable if this bill had not been passed.

Mr. POPE said he would suggest a clause which would meet the justice of the case. This clause was submitted, but

Mr. PEMBER submitted that the clause read by Mr. Pope did not give him the protection the Committee said he should have.

Mr. POPE, after further argument, suggested a modification of the clause which he had brought up, which would now read as follows :—

"If it be proved that any injury or damage to any gas or water pipes, or other metallic pipes, structures, or substances of any gas or water company shall have resulted from fusion or electrolytic action caused by any currents generated or used by the Council for the purpose of electric traction under this act, and nothing in this act shall relieve the Council from any liability to make compensation for such injury or damage which would have existed but for the passing of this act."

He wanted to make it clear that the injury for which they were to pay was caused by the Council, because, he pointed out, electrolysis arose in part from moisture which might be due to carelessness on the part of the companies in allowing their mains to be leaky.

The CHAIRMAN : Certainly.

The clause was accepted by the Committee, who proceeded to consider ther clauses of the bill.

On Clause 14, Mr. CASTLE, Q.C., proposed, for the protection of the South Metropolitan Gas and Lambeth Waterworks Companies, the following :—

"If, within seven days after a notice under the preceding section of this act shall have been served upon any gas or water company, that company shall elect to themselves execute all such alterations to their mains and pipes, the reasonable costs of executing such alterations shall be repaid by the Council to the company, provided always that such alterations shall be carried out in accordance with the directions and to the reasonable satisfaction of the chief engineer of the Council."

Under the bill the work was not to be done by the companies, but under their superintendence. That, however, was not sufficient, as was shown by a recent explosion at Manchester, in which an engineer lost his life owing to the incautious way in which a main had been handled.

The CHAIRMAN accepted the clause, and the bill, as amended, was ordered to be reported.

ROCHDALE CORPORATION BILL.

On July 19 the Select Committee of the House of Lords, of which the Earl of Camperdown is chairman, considered this bill.

Mr. R. W. HARPER, for the promoters, said Rochdale Corporation would next year and the year following have the right to purchase the existing tramways of a company within their borough. They propose to exercise that right, but the gauge being inconvenient, and one which prevented the trams from being worked with surrounding systems, with which an interchange of traffic was desirable, power was sought to alter the gauge, to make one or two extensions, and to electrically equip the lines. Some of the extensions proposed were outside the borough. The Lancashire and Yorkshire Railway sought protection for their property in the middle of the town, which they said was highly rated, and if they did not oppose the granting of the powers asked for they thought they should have some consideration in regard to rating in the event of the extensions outside the borough resulting in loss to them. The Corporation thought that request perfectly fair, although not thinking there would be loss. A clause was accordingly inserted in the bill, but had been cut out by the Police and Sanitary Committee, of which Lord E. Fitzmaurice was chairman, chiefly at the instance of the Local Government Board. In the Halifax Bill, which came before another section of the same committee, an identically similar clause was allowed, and the Halifax Bill had passed both Houses. In the Huddersfield Bill there was also a similar clause, and that bill had passed the Commons and would come before Lord Morley in the House of Lords as an unopposed measure. It seemed, therefore, that there was some difference of opinion.

The preamble of the bill was formally proved, and passed by the Committee.

Mr. POPE, Q.C., then submitted the following clause : —

"As regards all rates to be levied under the powers of this act relating to tramways owned, leased, or worked by the Corporation outside the borough, if at any time such tramways are worked at a loss the occupiers of any land used as a railway constructed under the powers of any act of Parliament for public conveyance shall be assessed to such rates in respect of the same in the proportion of one-fourth part only of the net annual value thereof."

The CHAIRMAN said that the Committee could not accept the clause. They would not, however, throw out the bill, but would further consider the matter in the light of two or three acts to which his attention had been directed.

On Monday, the CHAIRMAN said since the last proceedings he had obtained the proceedings in the Dundee and Aberdeen cases, and the Committee were going to consider the clauses in the acts relating to these places. The only difference in the two cases he could see was that in the Dundee case the depreciation on plant and machinery should be reckoned at not less than 3 per cent. In the Aberdeen case it was to be 3 per cent.

Mr. COATES, Parliamentary agent to the promoters, said he understood the difference between the two cases to be that in Dundee the undertaking was to be so arranged that there should never be any loss, whereas in the Aberdeen case it was to be so arranged that it should exactly produce the amount of money required, with neither loss nor profit.

The CHAIRMAN said the whole principle apparently of the Committee in the Dundee case was that if a municipality competed with certain of its own ratepayers if it made no profit it must not be allowed to make a loss. That was a principle which the present Committee thought worthy of wide consideration. It was one of the complaints against the whole system of municipal trading that a corporation might make a gain in one part and thus cover a loss in another. *Prima facie* the Committee thought there was very good reason for inserting this clause or something like it in the bill. They would like to hear argument against inserting such a clause.

Mr. HARPER said that would only relate, he supposed, to trams outside the borough ; if it applied to trams inside the borough it would alter the general law.

The CHAIRMAN said the Corporation were proposing to become traders and to take a portion of their undertaking outside their own limits, which was trading pure and simple. What reason was there why the Corporation should be forbidden to make a loss upon their tramways as a whole !

Mr. HARPER said it was matter of common knowledge that in every case, unless there was some very special circumstance, the cost to a borough of its tramways was levied upon the borough fund, in regard to which the railway companies paid in full. The railway company only asked for an exemption outside to the extent of one-fourth.

The CHAIRMAN said that was what the railways asked for, but that the Committee would not give them. It was not now the railways who were making a demand ; it was now the Committee who were making a proposal and asking what reason there was why the Committee should not insert in the bill a clause saying that the municipality should not make a loss upon their tramways, especially as they proposed to go outside the borough.

Mr. HARPER said as regards the particular circumstances in this case the extension outside was only for about a couple of miles ; and he suggested that in so small an extension so large a departure should not be made.

Further discussion followed, in which several counsel expressed the opinion that in no borough in England where a municipality worked tramways only within its own limits was there a provision that they were in no case to make a loss.

The CHAIRMAN eventually said : The Committee are of opinion that in a case such as this, where a municipality takes over tramways, including tramways which are beyond its own area, it is right that, if possible, they should be prevented from making a loss, so as to prevent, at all events to that extent, competition with private traders. As a means of giving expression to that opinion I now propound the clause in either the Dundee or Aberdeen case.

The clause in the Dundee Act was gone through line by line, and on Tuesday adopted in the following form :—

"The Corporation shall once in each year after the first two years' working cause the treasurer to the borough to lay before them a statement and balance-sheet of the tramway accounts, including the reserve and suspense accounts for the preceding year, and the estimate of the revenue to be derived for the ensuing year from the working and use of the Corporation tramways and carriages and trucks thereon, and also an estimate of the sums required to meet every such year's expenses of working, management and maintenance of lines, works, machinery, and rolling stock, repairs, renewals, materials, rents, wages, taxes, and other outgoings and charges, and including loans, and also the interest on all money borrowed under the powers of this act on the security of the tramway revenue and borough fund and borough rate, and the payment of the sums required to be annually made to the sinking fund for the repayment of such moneys as provided for by this act, and the Corporation shall thereupon fix annually the tolls, fares, and charges to be levied by them for the use of the Corporation tramways and all the carriages and trucks used or propelled thereon for the said year then ensuing not exceeding the tolls, fares, and charges specified in this act, so that the revenue shall meet the expenditure as before specified for each year.

"Provided that if in any year the revenue exceeds such an expenditure the Corporation shall carry such excesses to the reserve account to be used in providing for the advances and contingencies, and that should there be a deficiency in any year it shall be provided for in the estimate for the following year, or by drawing from the reserve account, or varying the tolls, fares and charges, or reducing working expenses, or

Digitized by Google

by carrying to the suspense account, and reducing gradually over a period of years not exceeding five.

"Provided also that in making the estimates aforesaid and balancing accounts at the end of such year the depreciation on machinery and plant shall be at the rate of not less than 3 per centum on the first cost thereof.

"Nothing in this section shall be construed to injure or affect the security for any moneys borrowed by the Corporation under the provisions of sub-sections *a*, *b*, *c* and *d* of the section of this act the marginal note whereof is 'Power to borrow on the security of the tramway revenue and borough fund and borough rate.'"

The other clauses having been adjusted, the bill was then ordered to be reported.

WESTON-SUPER-MARE TRAMWAYS BILL.

The Select Committee of the House of Lords, of which Lord Brassey is chairman, on Tuesday considered the bill confirming a provisional order of the Board of Trade authorising the construction of tramways in the district of Weston-super-Mare. The proceedings before the House of Commons Committee were fully reported in *The Electrician* for June 29 and July 6.

Mr. WORSLEY TAYLOR, Q.C., for the promoters, said the order was for a tramway, 3½ miles long, to be worked by electricity. There was no real question as to the preamble, the question being as to a clause for the benefit of the Commercial Cable Co., who had a cable which landed at Weston. The company paid a shilling a year for this right, and were in the position of any ordinary landowner. The Cable Company contended that as they used electricity at very low pressure, and the promoters used a high pressure the working of the submarine cable would be seriously affected, if proper precautions were not taken. But, he urged, the Cable Company went to Weston with a full knowledge of the possibility of electric tramways being introduced, and they must take the risk that this course involved. The Cable Company asked for a clause giving them power to do such work as might be necessary to prevent their being injuriously affected, and that the tramway promoters should reimburse them for the expense of this, and compensate them for any loss or damage caused to them. This, the promoters urged, was an attempt on the part of the Cable Company to reverse the whole course of legislation on this question. The matter was of some importance because this was the first case of a tramway company seeking powers to work their system electrically where a submarine telegraph cable was already laid. But the principle was not a new one. He remembered when electric tramways were first proposed they were supposed to be dangerous to the rights of the Telephone Company, who used the current at an even less pressure than the Cable Company. It was proposed that the Tramway Company should be compelled to use an insulated return; but it was held that, whereas in the public interest the Tramway Company should be bound to take all reasonable precautions, the cost of such precautions should not be so great as to retard or prevent the development of tramways. He urged that the Board of Trade had made special provisions for the use of electricity which was for the protection of the public as well as of the Post Office. The whole question was thrashed out by the Telephone Company, with the result that to-day the company had to protect its own interests; and he submitted that what was good enough for the Telephone Company was good enough for the Cable Company.

At the conclusion of the promoters' case, Mr. PEMBER, Q.C., referred to the vast public importance of the submarine telegraph cable, and said that great injury would be caused to the Cable Company if this proposed tramway was worked under the ordinary Board of Trade regulations. He urged that the aggressors, rather than the aggrieved, should bear the expense of protecting the cables. He had proposed a clause to the effect that the provisional order should not interfere with any rights of the Cable Company at common law in connection with the use of their submarine cable.

Mr. JAMES SWINBURNE and Prof. W. E. AYRTON having given evidence in support of the petitions,

The Committee declared the preamble proved. They did not grant any protection clause to the Cable Company.

THE DURHAM ELECTRIC POWER BILL.

On Wednesday the bill of the County of Durham Electric Power Supply Co. came before the House of Lords Committee, presided over by the Duke of Argyle.

Mr. BALFOUR BROWNE, Q.C., for the promoters, said the bill was thoroughly considered by the Committee of the other House. [See *The Electrician* for May 25.] At the present time the difficulties in the way of supplying electricity cheap was that it was only used for the purpose of lighting, so that very expensive machinery was standing still for a great portion of the day. Eight hours out of a hundred only were used for generating electricity for lighting powers, and during the remaining time the capital and machinery were lying idle. The object of the Durham Company under the bill was to generate electricity for other as well as for lighting purposes, and thus to make greater use of the plant. They would then be able to supply current at a cheap rate and make a profit. The bill was in practically the same form as it was in the other House, but some additions had been made for the protection of local authorities. Clause 32 would prevent the company from paying an excessive dividend, and that was for the protection of the public; and at the end of ten years there was to be a revision of their charges, and if the Board of Trade found a reserve fund in their hands they would reduce the prices. Under clause 44, if within two years of the passing of the act, the company had not substantially commenced the work, or if within four years they had not erected a generating station or stations, and were not in a position to supply electric current, the Board of Trade might revoke the act. Their limits of supply extended over 100 square miles, and they were not opposed by anybody in that large area except the Councils of Felling and Hebburn.

Evidence having been taken in favour of the measure, and counsel heard in opposition,

The committee decided that the bill should be allowed to proceed, with an alteration in the clauses relating to Felling and Hebburn providing that wayleaves only be allowed.

Yesterday the bill was ordered to be reported.

SHANNON WATER AND ELECTRIC POWER BILL.

In the House of Lords on Monday, on the motion of Lord Lurgan, the second reading of this bill was, after a brief debate, agreed to.

EDINBURGH CORPORATION ACT.

This act, which now awaits Royal assent, authorises the Corporation *inter alia* to supply electricity in bulk to any local authority or person outside the city having statutory authority to supply electricity for either lighting or power purposes.

BROMPTON AND PICCADILLY CIRCUS RAILWAY BILL.

This bill is not to be further proceeded with this session.

MANCHESTER CORPORATION TRAMWAYS BILL.

The Select Committee of the House of Commons, presided over by Mr. Seale-Hayne, on Tuesday considered the bill promoted by the Corporation of Manchester, authorising considerable extensions of the tramways within and without the city, to be worked together with the present lines by electricity on the overhead trolley system. The bill has already passed the House of Lords. The estimated cost of the construction of the new lines and of the electrical equipment of the existing and new lines is £1,500,000.

Counsel for the promoters were Mr. Balfour Browne, Q.C., Mr. Lewis Coward and Mr. Rhodes; and the petitioners against the bill were represented—the British Electric Traction Co. by Mr. Worsley Taylor, Q.C., and Mr. Moon; and certain frontagers in Manchester by Mr. Forbes Lankester.

Mr. LEWIS COWARD said the bill not only sought to construct additional tramways in and near Manchester, but to confer powers on the Corporation and neighbouring authorities in respect to tramways beyond the city. Manchester Corporation were the owners of tramways within the city aggregating 58 miles of single track, which were at present under lease to the Manchester Carriage & Tramways Co., and worked by horse traction; this lease expires in April, 1901. A committee appointed by the Corporation had reported in favour of the Corporation working the tramways themselves, and of the adoption of electric traction. That recommendation was adopted by the City Council, and in 1897 the Corporation obtained from Parliament powers. The Carriage Company went to Parliament in 1898 with a bill to enable them to introduce electric traction on the lines and to continue the working of their system by arrangement with the various local authorities. That bill was opposed by the local authorities, who preferred that the Manchester Corporation should work the tramways, and was rejected by Parliament. Last year the Corporation obtained further powers in regard to their tramways, including powers to work and take leases of lines outside the city to Failsworth, Audenshaw, Denton and Heaton Norris, and agreements were about to be signed with the Councils of Stretford, Moss Side and Withington. By the present bill the Corporation would obtain general permissive powers to enter into agreements with other local authorities. The Tramways committee of the Corporation had recommended the present application for powers to construct a number of junction and extension lines—about 38 miles of single track. There was no doubt that these new lines were necessary to the provision of adequate tramway accommodation. It was the intention of the Corporation to adopt through routes, so that cars would pass right through the centre of the city. There were two petitions against the bill, one from frontagers, and the other from the British Electric Traction Co., who had powers to construct certain light railways in Middleton and neighbourhood, and who feared that the Corporations of Manchester and Middleton, if the powers of the bill were granted, would obtain a monopoly that would restrict the natural development of the company's light railways. In regard to the junctions to be made with the light railways, the Corporation could, under the bill, only act with the consent of the owners of those lines.

Mr. D. BOYLE, chairman of the Manchester Tramways committee, gave evidence bearing out the statements of counsel. He said the consideration to Middleton for the 21 years' lease arranged for was, that the interest and sinking fund on the capital involved in the construction of the lines would be met during the term of the lease by Manchester, and at the end of 21 years the tramway would become the property of Middleton. If Middleton desired to acquire the light railways of the British Electric Traction Co, they would have to buy them, whereas the tramways would pass to them at the end of 21 years without payment.

Mr. F. ENTWISTLE, clerk to the Middleton Council, said, with regard to the objections raised by the British Electric Traction Co., the routes of the proposed lines were not natural extensions of their light railways. The tramways need not be joined with the railways, and would not interfere with them. In regard to the suggestion made by the company that they were the proper people to become the lessees of the

Digitized by Google

Middleton tramways, his Council repudiated the idea as unwarrantable. His corporation had prevented, as far as possible, connection between these tramways and the light railways because it would enhance the value of the light railways in case of purchase. Middleton would rather deal with Manchester. They thought that the company had no right to say to them what they should do in tramway matters. The company were not ratepayers in Middleton.

Mr. McELROY, general manager of the Tramways of the Manchester Corporation, said the Middleton agreement was on all fours with agreements under the Act of 1899, and was, he considered, only a fair one to the Manchester Corporation.

The promoters case being closed,

Mr. WORSLEY TAYLOR, Q.C., said the point raised here was important to tramway and light railway companies, and the case was one of extreme hardship to the British Electric Traction Co., who had relied on the grant of powers made to them under the Light Railways Act so long as they did their duty to the public. There could be no doubt as to the willingness and capacity of the company to carry out its engagements. The company had a large capital and was paying a good dividend on their undertakings in various parts of the country. They were now constructing the 8 miles of light railway running into Middleton, and were in a position to construct and work any necessary extensions. Manchester and Middleton, knowing where the company's light railways would end, had wilfully cut short their proposed tramways from the light railways by about the width of a street to prevent the value of the light railways being enhanced by a junction with the tramways, and so had conspired to defeat the interests of the public for 25 years in order that, at the end of that time, Middleton might not have to pay quite so much for the purchase of the company's light railways. The proposals of the bill would be of advantage, not to the public so much as to Manchester, as it would extend the Corporation's monopoly right out into the suburbs, and establish municipal trading on a large scale. He asked the Committee not to sanction this agreement between Manchester and Middleton, which would tie up this district by preventing these small links being made between the light railways of the company and the tramways for the next 21 years, irrespective of the necessities that might arise in that time.

On Wednesday the committee decided that the preamble of the bill was proved, but postponed the consideration of clauses.

RAILWAY COMPANIES AND ELECTRIC TRAMWAYS.

In the House of Commons on Tuesday Mr. T. M. HEALY asked the President of the Board of Trade whether the Great Northern Railway Co. (Ireland) disputed that the construction of their electric tramway from Sutton to Howth was illegal; and, if it was not in accordance with the act, had the Board of Trade ever previously sanctioned a line made contrary to statutory provisions?

Mr. RITCHIE said the first statement of the hon. member was correct. As to the second, the Board of Trade had no power either to sanction or not to sanction the line. They could not determine the legal questions at issue. All the Board had to do was to look after matters of safety. He further stated that it was not part of the functions of the Board of Trade, where the act of Parliament stated that the line should be laid on a level with the road, and when it was laid 1½ft. above that level, to state whether the line was legal or illegal. Their functions were confined to the question of safety.

Mr. HEALY stated that he would at another time ask the Attorney-General if he would consider whether an indictment should not be presented against the company in regard to the line.

IMPERIAL TELEGRAPHS.

In the House of Commons on Monday Sir E. SASSOON asked the Secretary to the Treasury if he would state the composition of the departmental committee on the system of cable telegraphs of the Empire, and the scope and terms of its reference.

Mr. HANBURY replied that the terms of reference were—

"To inquire into the present system of telegraphic communication between different parts of the Empire, and to consider in what respects it requires to be supplemented, to investigate the relations between private cable companies and the Imperial and Colonial Governments (including the Government of India), the amount of control at present exercised by these Governments, and the policy which should be pursued by them in future, especially when new concessions are sought; to examine existing rates; to report how far they are fair and reasonable, and if not, how any reduction can be effected."

The Committee would consist of Lord Balfour of Burleigh, the Postmaster-General, the Secretary of the Treasury, the Under-Secretaries for India and the Colonies and two members from the Intelligence branches of the Admiralty and War Office.

LEGAL INTELLIGENCE.

Brockie-Pell Arc Lamp (Ltd.) v. Johnson & Phillips.

Yesterday, before Mr. Justice Kekewich, in the Chancery Division, a motion was heard to commit defendants for alleged breach of part of an order made by his lordship on April 22, 1899, in the following terms:—

"It is ordered that the defendant, Walter Claude Johnson (trading as and sued as Johnson and Phillips), his servants, agents and workmen, be restrained during the continuance of letters patent No. 4,248 (1892), No. 15,510 (1893), No. 12,932 (1894), and No. 23,825 (1894), or any of them, or during any extension of the respective terms thereof, from manufacturing, selling, or exposing for sale Victoria lamps, one of which is now in the custody of the plaintiffs, and is marked A. M. C. & Company & G. W., and from in any other manner infringing the said letters patent; but this order is not to apply to any Victoria lamps manufactured or sold by the defendant and bearing serial numbers" (the numbers of 200 of these lamps follow).

Mr. Warrington, Q.C., and Mr. J. C. Graham appeared for plaintiffs, and Mr. Fletcher Moulton, Q.C., and Mr. A. J. Walters for defendants.

Mr. WARRINGTON said the notice of motion asked that the Court be moved to commit defendants for breach of that order by selling certain lamps known by the name of "Victoria" lamps. The action in which the order in question was made was one for infringement of certain patents, and restrained defendants during the continuance of plaintiffs' letters patent from manufacturing, selling, or exposing for sale Victoria lamps, and defendants were not in any other manner to infringe the said letters patent. But the order was not to apply to any Victoria lamp manufactured or sold by defendants which bore the serial numbers mentioned in the order. The order then went on to state that all further proceedings be stayed except for carrying the order into effect. His lordship, said counsel, would see that the order was in two parts. It first restrained defendants from manufacturing or selling or exposing for sale Victoria lamps; and, secondly, it restrained defendants from infringing the plaintiffs' letters patent. The present motion was not founded upon the second branch of that order but on the first, and if he (counsel) failed to satisfy his lordship that the lamps the defendants had been selling were within the true meaning of the order "Victoria" lamps, then except to two of the lamps, which were admittedly Victoria lamps, the motion would fail. On the present notice of motion he asked his lordship for relief and to say that certain lamps which it was admitted had been sold by defendants were Victoria lamps. The notice referred to lamps of certain numbers. The first two of those were admittedly Victoria lamps, and they were not included amongst the serial numbers mentioned in the order and excepted in the injunction. The consequence was that on those two lamps the plaintiffs were clearly entitled to have an order to commit defendants who had committed a breach of that order. The only answer on that part of the case was that defendants had sold those two particular lamps to certain third parties before the date of the order, and had re-purchased them and sold them again. He (counsel) submitted that that was no answer as defendants were restrained from selling any Victoria lamps except those mentioned in the order. The defendants had no right to sell these lamps again. Plaintiffs could not prevent third parties from selling the lamps, but they could prevent defendants from selling them. The order restraining defendants from selling these lamps was absolute. Amongst the numbers mentioned in the notice of motion were Nos. 16,337, 16,354 and 16,338. That referred to lamps to which defendants had applied the same serial numbers that were mentioned in the order, and had sold them. Plaintiffs' case was that the defendants had made certain slight and immaterial changes in those lamps for the purpose of being in a position to say they were not Victoria lamps. The changes which had been made were immaterial and trifling, which left the lamps substantially what they were before. The only lamp which his lordship would be troubled with was that numbered 16,338, which hung on a frame in the court, and it had been agreed between the parties that all the other lamps except the first two were identical with the lamp No. 16,338. No. 16,371 also bore one of the serial numbers mentioned in the order, but those were in the same position as those he had mentioned, and were sold after the 200 lamps mentioned in the order had been sold. With regard to the others, Nos. 16,839 and 16,863 were sold to a Mr. Hawkins.

Mr. MOULTON: We admit the sale of all these.

Mr. WARRINGTON: Well, all your lordship will be troubled with is to say whether No. 16,338 was a Victoria lamp or not. He would first point out in what way 16,338 was said to differ from the Victoria lamp. The construction of the Victoria lamp was as follows: It was only necessary for present purposes to state that it started off with a brass plate, and from that there was a central column of brass, which was fastened on to a thing which was sometimes called a U-shaped plate. On to the two straight uprights was fastened the top plate. Two vertical bars were fastened on to the top plate. The object of the U plate was to support that which regulated the rising and falling of the lever which controlled the two rods which lifted and depressed the upper part. The object of the lamp was to keep the upper and lower carbons, so as to let the electric current pass and keep the sparks steady. At the bottom there was a little guide lever, but the lamp would work just as well without it. It was of no importance as to the action of the lamp. The only other thing he need mention with regard to the construction of the lamp was in reference to the two rods which supported the globe. The globe was attached by a button on the rim and to one of the rods by a kind of hinge. When it was desired to get at the carbons the rim was unhooked from the bottom and the globe dropping on one rod could be made to swing outwards so as to be quite free of the two carbons. That was the Victoria lamp. Now, he would take his lordship to the other lamp which was said to differ from it. That started exactly in the same way with the plate and

Digitized by Google

with the central column. Then they had the same horizontal bars and the same upright bars up to within an inch of the plate. What defendants had down was this: Instead of carrying the uprights to the top they had substituted for them a column and fastened it on to the horizontal plate. It did not make the least difference mechanically which rod it was supported by. They had done the same thing on the other side and connected the two rods. That did not affect the construction in the least. If the two rods were away the action would be the same as if they were there. There was another difference which defendants had made in this part of the lamp and that was the omission of the little guide lever. Defendants had made other slight variations in the construction of their lamp which were merely colourable variations in order that they might say they were not selling Victoria lamps.

Counsel then read affidavits in support of his case.

Mr. DUGALD CLERK, in his affidavit, stated that he had carefully examined and compared the electric arc lamp No. 16,338, which was typical of all defendants' lamps, with the Victoria arc lamp. In his opinion, the lamps were substantially the same. There were some trifling differences in the structure of the two lamps; but they were so trifling that they could not be said to make No. 16,338 a different lamp from the Victoria lamp.

Mr. BROCKIE stated that in his opinion the lamps were in all respects substantially identical.

Mr. WALTER then read defendants' affidavits.

Mr. W. CLAUDE JOHNSON said he was in a large way of business in the manufacture of electric arc lamps and other electrical appliances. For several years past he had employed a competent manager in his arc lamp department, who was an engineer of great experience. Upon the order of April, 1899, being made he gave this gentleman instructions to carry out the order. Personally he had never designed, made or sold any lamp in breach of that order. To his knowledge there had been no evasion of the order of the Court.

Mr. W. B. ESSON, defendants' engineer, deposed that the order of April, 1899, had been carried out; 200 lamps had since been sold, but none of them were Victoria lamps or infringed plaintiffs' patent, and were not constructed in breach of the injunction. When the order was made he at once made it his business to reconstruct the arc lamps of defendants so as not to include the structural features alleged by plaintiffs to comprise their claim, and did not infringe plaintiffs' patent. None of the features described and specifically claimed by the plaintiffs were included in these lamps. The points of difference were such as to place the lamps wholly outside the scope of plaintiffs' specification. The mere repetition of certain of the numbers mentioned in the order could not injuriously affect the plaintiffs. The Victoria lamps referred to were originally sold by defendants in September, 1897 and 1898. In respect of these lamps royalty had been paid to plaintiffs under the agreement of 1899. The said lamps had been returned to the defendants and re-issued in the ordinary course of business.

Prof. S. P. THOMPSON, in his affidavit, said he had been familiar for some time with the lamps manufactured by plaintiff company and by defendants. He had examined the Victoria lamp and the No. 16,338 and found two substantial and complete differences between them. Plaintiffs claimed infringement by defendants in the employment of a regulator and the focussing mechanism, and in the use of a brake wheel controlled by a loaded band. He had carefully examined the lamps with regard to these points. In the lamp 16,338 there was no use of a spring brake, supplementing the main brake, which there was in the Victoria lamp. There was a substantial difference between the mechanism of this lamp and that of the plaintiffs'. The defendants had returned to the old use of two guide-tubes. The particular use of a single tube was that it allowed the globe when lowered to swing open on one side. That advantage was not possessed when the two tubes were used. There was no loaded band in No. 16,338, but, instead, a different brake. Having examined the Brockie-Pell arc lamp, he came to the conclusion that defendants' lamp did not contain any of the combinations or detailed mechanism which the plaintiffs claimed to be covered by their patents. In those respects in which 16,338 differed from the Victoria lamp, it differed from the admission of features of old and well-known matters of construction. In respect of the features which the lamps had in common, defendants were using nothing that was not common to all the world, and well known prior to 1892.

Evidence was then called.

Mr. BROCKIE, cross-examined by Mr. Fletcher Moulton, said that his affidavit of February, 1898, was in an action for infringement of letters patent. He had applied for an interim injunction. In paragraph 4 the invention claimed the combination of a spring brake supplementing the main brake on the regulating wheel. That was one of the points in which he alleged that the Victoria lamp made by defendants infringed his patent. As a matter of fact, the lamp he complained of had no spring brake supplementing the main brake. The letters patent 12,982 of 1894 were granted in respect of an invention of an arc lamp in which the crown plate was fixed to the top U-shaped piece, within which the brake and focussing wheels were placed, In that patent for the first time he showed this U-shaped piece attached to the top piece and holding the wheels. That he considered novel at the time. The globe gear was supported by a single tube attached at its upper end to the base plate. It also acted as a guide to the carbon rods. This last was not to be found in the lamp complained of. The U-shaped frame was practically the same in both lamps. The whole of the lamp was quite free to the public, except the point he had mentioned. In the letters patent 23,825 of 1894 the claim was for controlling the great wheel or wheels by means of a loaded band in combination with levers. In the lamp he complained of the band was loaded by means of a heavy weight attached to it. Band brakes were common for years. The releasing of the brake was the main thing in the patent.

Mr SHRIMPTON said he had negotiated the settlement of the action referred to. In making the settlement he intended to clear up all the past disputes. The payment of £1,675 was in respect of the lamps previously made by defendants. He had never made any attempt to interfere with the user by the public of lamps included in the settlement.

Mr. MOULTON said it was claimed that defendants' lamps did not differ from plaintiffs, or if they did it was in matters perfectly immaterial. He admitted that if defendants were repeating that which had been complained of he could not go back on the question of whether it was an infringement of the Victoria lamp. If it could be said that defendants' lamp was identical with plaintiffs', it would support plaintiffs' case. But the moment he left identity his case disappeared. There was no such thing as substantial identity in the abstract. You had to consider what were the material points by which you were to judge or not judge of the identity. For instance, it might be said that defendants were not to sell lamps of a particular size or strength. Then if you could show that they were selling lamps of the size or strength the case would be proved. But here the action was for infringement. Under these circumstances identity was destroyed if once you showed that any points which were taken as material were points in which the lamps differed. There were differences between the two lamps, and he submitted the plaintiffs had not made out a case to justify the granting of a committal order.

His LORDSHIP said that in his opinion there was substantial identity between the two lamps—the Victoria lamp and the lamp No. 16,338. The endeavour to distinguish them had been slight. Certain differences had been pointed out, but it was clear that these differences were mere differences in detail, and did not interfere with the real identity of the lamps. He had no doubt that they were adopted in order to enable defendants to put on the market Victoria lamps substantially like those mentioned in the order. It seemed to him that plaintiffs had proved their case. It was useless to go through the differences in detail, because to his mind the evidence was overwhelming that the differences were only differences in detail. What he had before him in No. 16,338 was substantially the Victoria lamp. He had no doubt that the defendants had been attempting to evade the order of the Court if possible. They had not succeeded. There would be an order for committal, and defendants must pay the costs.

Mr. MOULTON asked for a stay of the order pending an appeal.

His LORDSHIP said the order must be drawn up, but a stay would be granted if an immediate application were made to the Court of Appeal.

Mr. MOULTON said he would apply at once.

Attorney-General v. The National Telephone Co. (Ltd.)

In the Queen's Bench Division on Tuesday this case came before Justices Darling and Kennedy. The Attorney-General, on the relation of the London County Council, filed an injunction against the National Telephone Co. for opening and breaking up streets within the administrative county of London without the consent of the County Council and the licence of the Postmaster-General. The company contended that in what they had done they had been acting within their legal rights. The action was fixed to come on for argument, but after a brief consultation between counsel a settlement was arrived at.

The Attorney-General, the Solicitor-General, and Mr. F. T. Daldy appeared for the Crown; and the defendant company were represented by Mr. Joseph Walton, Q.C., and Mr. Roskell.

The ATTORNEY-GENERAL said Mr. Walton had communicated with the Solicitor-General and himself, and they had arranged the terms of settlement if their lordships would allow the information to be disposed of in that manner. The terms were (1) a declaration (in the terms of paragraph 1 of the information) that the defendants were not entited to lay any pipes, wires, cables, or apparatus for telephonic purposes under any of the streets in the county of London unless by licence of the Postmaster-General under the Telegraph Acts, and with the consents required by those acts, (2) an injunction restraining the defendant company, their officers, servants, and agents, from opening or breaking up any street or public road within the meaning of the Telegraph Acts, 1863 to 1899, within the adminstrative county of London, or any part of such street or public road for the purpose of extending the company's present system of underground pipes and wires, &c., without the authority of the Postmaster-General and the consent of the London County Council for such purposes described by the Telegraph Act of 1892, and (3) the defendant company to pay the taxed costs.

Mr. WALTON, Q.C, said he assented to these terms, by which they put an end to a long controversy on the subject, in the interest both of the telephone company and of the Crown.

The Court sanctioned the agreement.

Crystal Palace District Electric Supply Co.

In the Chancery Division on Saturday, Mr. Justice Kekewich heard a petition by shareholders for a reduction of the capital.

Mr. WARRINGTON said the company had a fully-paid up share capital of £28,586. It was proposed to reduce that to £2,858, a loss of 18s. per share. There was a loss in working of £14,885. 16s. 5d., and in depreciation of assets of £11,000, making £25,885. In addition there was £1,600 appearing in the accounts of last year as "preliminary expenses and losses on working" which had been struck out in the last accounts. The affidavits filed in support of the motion set forth that it was almost impossible under existing circumstances for the shareholders to receive interest for many years to come. For three years the undertaking had been carried on by money provided for working capital. The proposed reduction could be no hardship.

Mr. RENSHAW, Q.C., said the reduction would operate unfairly on the shareholders. There was no sufficient evidence as to the loss in carrying on the concern which would justify the reduction of capital. The affidavits dealt entirely with generalities, and there was no detailed statement whatever as to the loss.

Digitized by Google

His LORDSHIP said some companies spent enormous sums in connection with the floating of their undertaking. Here it had been satisfactorily proved that what was put in as preliminary expenses were not those at all. Now that a valuation had been made they knew that depreciation and actual loss of capital between them made up the full amount to which it was proposed to reduce the capital of the company, which had been valued as a going concern. Mr. Chapman, the only dissentient shareholder before the Court, held 40 shares. It was said that this interest was so small that it ought to be disregarded. He was not prepared to take that view. But in this instance there was no doubt the proposed reduction of capital would get rid of the burden on the company, and might be the means of making it a success. He sanctioned the resolution, and Mr. Chapman's costs must be borne by himself and not by the company.

Simon v. Conze.

Mr. Justice Mathew and a special jury heard a case on Monday in which plaintiff sought to recover damages for an alleged breach of an agreement by defendant not to canvass plaintiff's customers. Defendant denied the breach, said he was entitled to act as he had done, and counterclaimed for £50. Plaintiff, an electrical engineer, carried on business as Simon & Berry, in Upper Thames-street. Defendant was formerly his partner, but was now partner in another firm. The partnership between plaintiff and defendant existed from 1894 to 1896. About the beginning of September, 1896, defendant, it was alleged, went to Germany, unknown to his partner, and when he came back told his plans to the plaintiff, and a dissolution of partnership was agreed on. A dissolution agreement was duly entered into, reciting that £200 of defendant's share in the business was to remain on loan. Defendant was not, within the City of London or within 2 miles thereof, for five years, to carry on a business of a like or similar character to that hitherto carried on between the parties, and was not to directly or indirectly canvass or endeavour to obtain customers from among the customers of the old firm of Conze & Simon, or who might hereafter be the customers of Simon. About six months afterwards, Simon took Berry into partnership, and the business was developed. Friction occurred between Simon, Berry & Co. and defendant over an agency for a German firm (Messrs. Busch & Co.) which was then held by Simon, Berry and Co. This agency was terminated in July, 1899, and a Mr. Eich appointed. Messrs. Busch, in September, 1899, sent out a circular to plaintiff's customers announcing the transfer, and a second circular was sent out by Eich. Both these circulars, it was contended by plaintiff, were in contravention of the arrangement under which the partnership between Conze and Simon was dissolved. The effect of their publication was of a damaging character to plaintiff's business. After hearing the correspondence,

His LORDSHIP suggested an arrangement should be come to.

Mr. NEVILLE, for defendant, said other actions were pending before the Official Referee.

Ultimately the case was settled on terms not stated, and the jury discharged.

Mercier's Patents (Ltd.) v. St. Helens Cable Co.

At Manchester County Court on Monday plaintiffs sought to recover £50 damages from defendants for breach of contract and non-delivery of certain electric cables.

Mr. SPENCER HOGG, for the plaintiffs, said that in November, 1899, defendants agreed to supply plaintiffs with two lengths of vulcanised rubber cable. A portion of the cable was delivered in December, but defendants then declined, as plaintiffs alleged, to deliver the remainder on the original terms, but only on condition that payment was made for the first portion of the cable, and that the second portion was paid for in advance. In consequence, plaintiffs alleged they were unable to execute a contract for the electric lighting of Winstanley Colliery, Wigan.

After plaintiffs' case had been closed, Mr. RHODES, for defendants submitted that though there had been a breach of contract the damages sustained were very slight.

The JUDGE said he did not understand why the action was contested, and gave judgment for plaintiffs for £21 and costs.

Re Westminster Automatic Telephone Syndicate.

On Wednesday a petition for the winding up of this company was dismissed, the petitioner being ordered to pay the taxed costs.

The Belle Isle Cable.—A correspondent of the *Financial News*, writing from St. John's, Newfoundland, as to the decision of the Canadian Government to lay a cable to Belle Isle, at the Strait of Belle Isle entrance to the Gulf of St. Lawrence, points out that such a line will inevitably be broken by icebergs in winter, and probably could not in that case be repaired until the following June. As a station could be established on the mainland within 10 miles of the island, the correspondent very reasonably asks why a wireless telegraph service should not be established, and urges the necessity, in the interests of shipping, for the land telegraph system to be extended on both sides of the Strait, so that prompt communication in case of shipwreck should be available. The wreck of the "Scotsman" last October, and of many other vessels in the neighbourhood, shows the great need for such telegraphic connection.

MUNICIPAL, FOREIGN & GENERAL NOTES.

Barnstaple.—The Council is about to discuss the question of carrying out the terms of their provisional order.

Birmingham.—The Council have confirmed the purchase of the old general hospital for the use of the electrical department for £23,000.

Bradford.—An inquiry was held here on Friday into the application of the Council to borrow £56,000 for extension to the electricity works. The town clerk (Mr. F. Stevens) appeared in support of the application, and said that since 1888 £230,880 had been borrowed for electricity supply. Of the present loan £5,100 was for extension of the buildings, and the remainder for machinery, including four water-tube boilers, with mechanical stokers, &c. (£8,560), 2,600 H.P. steam dynamo (£9,500), cooling towers, fans, pumps, and piping (£6,000), battery (£3,000), mains (£15,000), and meters (£4,500). The city electrical engineer (Mr. R. A. Chattock) gave technical details. There was no opposition.

British Guiana.—There are 560 subscribers to the telephone system in Georgetown. The subscription is £5 per annum for business premises and £2 for private houses. A telephone exchange is also established at New Amsterdam.

Buenos Ayres.—A concession has recently been granted for a line of underground electric tramways between two railway stations in this city situated at the extreme points. The company which has secured this concession has also obtained powers to construct other electric lines in and about the city area. There are 39 miles of electric tramways already working. The concession above referred to is, it is stated, being exploited in Europe and a company is being formed to work it.

Croydon.—The Council recently advertised for tenders for the reconstruction of the present tramway track and the construction of new tramways, and the paving of the roads. The Council have decided not to accept any of the tenders received, but will carry out the work by direct labour.

Dudley—Sedgley Electric Tramway.—Trial trips have taken taken place on this line, and the Board of Trade inspection will shortly take place,

Electric Light Notices.—Notices to local authorities of intention to apply for provisional electric lighting orders have been given as under :—

For *Alnwick*, Northern Counties Electricity Supply Co. and North British Electricity Supply Co. Both companies are to attend at the next Council meeting to explain their proposals.

For *Blackwell* (Notts), Shirebrook Colliery Co.

The *Beaumaris, Berkhampstead, Bishop Stortford, Blairgowrie Brighouse, Cannock, Carnoustie, Chichester, Crieff, Cumnock* (N.B.), *Dorchester, Helensburgh, Kirriemuir, Largs, Matlock Bath, Newburgh, Newport* (Dundee), *Pontefract, Richmond* (Yorks.), *St. Andrews* (N.B.), *Stranraer, Tewkesbury*, and *Worsboro'* local authorities have received notice from the North British Electricity Supply Co.

South Lancashire Tramways Co. are anxious to obtain powers for supplying electric current for lighting, and they have intimated to the *Ashton* Town Council that they intend to apply for a provisional order.

Blackburn Parliamentary committee have served notices upon the local authorities of *Livesey, Pleasington, Rishton, Wilpshire*, and *Witton* (*Lancs.*)

Middlesex & Hertford Electric Lighting & Power Co. have given notice to the *Cheshunt* District Council.

The Wycombe (Borough) Electric Light & Power Co. has served notice on the *Chesham* Council.

The United Electric Light & Traction Co. have applied for powers for *Cirencester, Esher, Spalding* and *Yeovil*.

The Urban District Councils of *Clayton-le-Moors, Harwood* and *Rishton* are jointly considering an application for consent to a provisional order.

Messrs. Crompton & Co. propose to apply for an order for *Dulkeith*.

Dorchester Town Council have received notices from the North British Electricity Supply Co., the Urban Electric Supply Co., Edmundson's Electricity Corporation, and the Bournemouth & Poole Electricity Supply Co., but all are to be opposed by the Council, who have resolved to retain electric lighting powers in their own hands.

Mr. E. H. Shaw has given notice in regard to *St. Margaret's* (Dover).

For *Dunfermline*, Urban Electric Supply Co.

Enfield District Council have received various notices of intention to apply for electric lighting powers, but the Council have resolved to themselves apply for an order.

Esher and Ditton District Council have received notices from the Twickenham and Teddington Electric Supply Co. and the United Electric Light & Traction Co.

A proposal by the Northern Counties Electricity Supply Co. to obtain a provisional order for *Filey* (Yorks.) is to be opposed by the Council.

Although the *Friern Barnet* Council has resolved to apply for a provisional order, the North Metropolitan Electrical Power Distribution Co have also intimated their intention to apply for electric lighting powers.

The *Foots Cray* (Kent) Parish Council have resolved to apply for a provisional order.

The Midland Corporation for Power Distribution (Ltd.) have notified the Walsall Rural Council of intention to apply for electric lighting powers in *Great Barr*. The Company has also served notice on the *Tettenhall* Council,

Digitized by Google

Finchley District Council will oppose a threatened application by a company for a provisional order.

The North British Electricity Supply Co. and the United Electric Light & Traction Co. have served notices on the *Gainsborough* Council.

The Northern Counties Electricity Supply Co. have notified the *Guisborough* District Council of their intention to apply for electric lighting powers.

Ham District Council have referred notices from Edmundson's Electricity Corporation and the Richmond Electric Light & Power Co. to the Highways committee.

Messrs. J. W. Manley & Co. will apply for a provisional order for *Herne Bay*.

Johnstone (N.B.) Town Council have received notice from the British Schuckert Electric Co.

The Electric Lighting committee of the *Kingstown* (Dublin) District Council is considering a notice to apply for a provisional order.

Notice has been given by the North Counties Electricity Supply Co. to the *Loftus* District Council.

For *Lyndhurst* (Hants) Lyndhurst Electric Lighting & Traction Co.

Although *Malvern* District Council obtained a provisional order in 1890 nothing has yet been done to comply with its provisions, and the United Electric Light & Traction Co. have now notified that they intend to apply for an order. The matter has been referred to the Gas committee—the committee which has hitherto had charge of electric lighting matters.

The *Molesey* (Surrey) District Council have received notice from the Twickenham & Teddington Electricity Supply Co.

Pudsey District Council intend to apply for electric lighting powers and to oppose the threatened application by the Northern Counties Electricity Supply Co.

The Northwood Electric Light & Power Co.'s application for *Rickmansworth* is to be opposed by the District Council.

Rye Town Council will oppose a proposed application for a provisional order.

The Northern Counties Electricity Supply Co. have intimated to the *Shildon* (Durham) Council that they intend to apply for a provisional order, and the matter is under consideration by the Electric Lighting committee.

Owing to the receipt of a notice the *Skipton* District Council have resolved to themselves apply for electric lighting powers.

Stourport Council have conditionally approved the proposed application of the Kidderminster & Stourport Electric Tramway Co. for a provisional order.

The *Stratford-on-Avon* Town Council have appointed a committee to report on a notice from a company which proposes to apply for a provisional order.

Swanage District Council have referred communications from the North British Electricity Supply Co. and the Bournemouth & Poole Electricity Supply Co. to the Works committee for consideration and report.

The County Electricity Co. has served notices on the *Wanstead*, *Woodford*, and *Buckhurst Hill* (Essex) District Councils.

The British Electric Traction Co. will apply for electric lighting powers for *Warwick*.

The General Purposes committee of the *Worsley* (Yorks.) Council are considering a notice of intention to apply for a provisional order.

Electric Light and Traction in Victoria.—The Ballarat Corporation have sanctioned the proposal of the British Insulated Wire Co. to form a local company to acquire the tramways and establish electricity works for supplying current for lighting, traction and power purposes. The new company will be styled the Electric Supply Co. of Victoria. It is stated that similar proposals have been approved by the Bendigo and Eaglehawk local authorities.

Exeter.—The Council has approved an important report from the Electric Lighting committee in favour of the erection of new electricity works in accordance with the recommendation of the borough electrical engineer (Mr. H. D. Munro). The scheme, estimated to cost £41,500, was submitted to Mr. T. P. Wilmshurst, of Derby, who reported favourably upon it. Particulars of the cost of the new station are as follows:—

For a building to receive plant of 3,000 H.P. capacity, and including the supply and erection of plant of 1,500 H.P. ...	£33,500
Site, say	2 000
Altering existing plant for frequency of 50	2,500
Moving existing machinery to new site	500
Main feeders	3,050

A lengthy report was also presented by Mr. Munro on the proposal to adopt a scheme of assisted wiring of consumers' premises, a proposal which the Council were recommended to endorse. The period for repayment of the instalments of capital cost by the consumer was fixed at three years. The chairman of the Electric Lighting committee (Ald. Domville) said that when the electricity works were taken over from the old Exeter company in 1896, they were 150 consumers, representing the equivalent of 7,300 8 c p. lamps. In 1898 the numbers were 300 and 14,000; in 1899 there were 353 and 18,000, and at present there were 400 consumers using 19,800 lamps. Those figures showed that it was absolutely necessary to provide a station adequate to supply the increasing demands. The demand for motive power was increasing as confidence in their methods was assured. The Council had also practically decided to take over the tramways, and they would probably extend the service and consider the adoption of electric traction. The proposed site was a convenient one, and the electrical engineer and the surveyor were of opinion that it was adequate for their requirements. With regard to assisted wiring, it was found that a profitable income was to be made from domestic lighting, and it was desirable that small householders should be induced to take electric current. The present proposal was that the occupier of the house should be empowered to submit three tenders for the wiring from tradesmen, one of which should be accepted by the Council, who would pay the tradesmen, and receive the amount again, with small interest, from the consumer, whose payments would be extended over three years. The committee's report and recommendations were adopted.

Glasgow.—The accounts of the electricity department for the year ended May 31 have been issued. The revenue was £59,762. 2s., of which £55,470. 17s. 2d. was from sale of current to private consumers, and £4,291. 4s. 1d. from public lighting. Last year the figures were £41,639. 6s. and £2,501. 18s. 7d., giving a total of £44,141. 4s. 7d., or an increase of £15,620. 17s. 5d. for the past year. The total expenditure was £38,181. 6s. 10d., leaving £21,580. 15s. 2d. to be carried to profit and loss. Last year the expenditure was £31,534. 2s. 3d., the amount set apart for depreciation £7,520. 18s., and to profit and loss £12,607. 2s. 4d. Borrowing powers amount to £700,000, and £628,500 has been borrowed at 3¼ per cent. Of this amount £11,500 has been repaid, leaving the department with borrowing powers to the extent of £60,000. The number of units generated last year was 3,401,731, against 2,619,019 in the previous year; the number supplied to private consumers was 2,566,016 units, against 1,885,902, an increase of 680,114, for public lamps 258,334, an increase of 30,200.

Hornsey (London).—Mr. Robert Hammond has been appointed consulting engineer to prepare and carry out an electric lighting scheme for this district.

Kiel (Germany).—The municipal authorities have entered into an agreement with the Siemens & Halske Actien Gesellschaft of Berlin for the erection of electricity works. The initial generating plant will consist of two 400 H.P. steam dynamos with a battery of accumulators.

King's Lynn.—The accounts of the electricity department for the year ended March 31 show a gross profit of £1,371. 14s. as the result of seven months' working, against which, however, must be set £1,366. 7s. 3d. for sinking fund and interest. Since the plant was opened in August last 126,496 units of current have been sold, producing an income of £2,536. 15s. 6d. Rental of meters has produced £31. 15s. 5d. and sale and repair of lamps £572. 9s. 7d. Of the income from the sale of current, £1,035. 12s. 9d. has been obtained from private consumers at 5½d. per unit and £1,501 2s. 9d. from public lighting. The demand for current is already far in excess of the capacity of the plant, but the Electric Light committee hope shortly to be able to satisfy all demands, and application has been made for sanction to borrow £10,000 additional for extensions.

Lancaster.—The Council on Tuesday decided to increase the price of electric current for private lighting in consequence of the increased price of coal. A report was presented by the Tramways committee recommending the Corporation to adopt the overhead trolley system on the local lines.

Light Railways.—An inquiry was held at Kingston-on-Thames on Monday into the application of the British Electric Traction Co. for an order to construct electric tramways in Kingston, Surbiton, Esher, and Thames Ditton. The local authorities interested, as well as the Surrey County Council, opposed the application, and the Commissioners refused to make an order.

The Board of Trade have approved the Southend-on-Sea and District Light Electric Railway order.

The promotors of the Warrington-Runcorn electric tramway have withdrawn their application for powers. The scheme will be presented in a modified form.

London County Council.—At Tuesday's meeting electricity loans were made to Battersea (£14,000) and Shoreditch (£30,000).

The Highways committee reported an offer by the British Westinghouse Company to sell to the Council for £900 the electric car shown in actual working at the recent Tramway Exhibition at the Agricultural Hall, London. Prof. A. B. W. Kennedy and the tramway manager (Mr. A. Baker) recommended that the offer be accepted, as the car, with some modification, would be available for use on the Council's lines when converted to electric traction, and would be useful when the specification for cars for the Council's electric lines was being prepared. A further offer was before the Council of the British Westinghouse Company to sell for £175 the permanent way, &c., used at the exhibition in demonstrating the facility and efficiency of the Westinghouse system. The committee recommended that both offers be accepted, and this was approved.

The Highways committee also reported on the subject of the further extension and doubling of track of the Council's tramways, the construction of new tramways of a total length of about 16¼ miles on the north side of the Thames, at an estimated cost of about £469,700, and for street widenings about £544,360; and on the south side of the Thames new lines about 12 mile

Digitized by Google

in length at a cost of about £374,500, and about £449,400 for street widenings. It is proposed that those of the new lines which will be connected with the Council's (Northern) tramways (leased until Midsummer, 1910, to the North Metropolitan Tramways Co.), shall be constructed for horse traction, unless in the meantime effect shall have been given to the provisions in the company's lease relating to the conversion of the system to electric traction. The estimates provide, however, for rails of sufficient weight to permit of electric traction when that system is adopted on these tramways. An exception to this proposal is the tramway in the Archway-road, N., which will practically be an extension from the Council's tramway terminus in that road to the county boundary, and will probably be joined with the light railways which the Middlesex County Council is seeking powers to construct from that point to Finchley and beyond. As the Middlesex Council proposes to adopt electric traction for its light railways, the committee consider it expedient that the Council's new Archway-road line should be constructed for a similar system of traction. Those of the new lines which will be connected with the London County Council tramways undertaking, or which, being for the present detached from either undertaking, could be worked by the Council independently of any other system of tramways, it is proposed shall be constructed for electric traction. The committee's report gave the following estimates for the electric lines:—

Archway Tavern, £8,400 (current to be obtained either from the Islington Vestry's electricity station, or by arrangement with the Middlesex County Council). *Harlesden to Putney Bridge* (4 miles 7 fur.), £146,250. *Uxbridge-road to Shepherd's Bush-road* (3 fur.), £11,250. *Brook Green-road* (5 chains), £2,000. *Victoria Embankment* (Blackfriars to Battersea Bridge, 4 miles 3 fur.), £132,000. *Battersea Bridge to Putney Bridge*, £179,000. *Victoria Embankment* (Westminster Bridge to Westminster Bridge-road, 3 fur.), £11,250. *Chelsea Bridge to Lambeth Bridge* (1 mile 4 fur. 8 chains), £50,000. *York-road to Tooting* (2 miles 7 fur. 8 chains), £90,000. *St. John's Hill to Surrey Tavern* (1 mile 3 fur. 1 chain), £47,500. *Battersea Park-road* (4 fur. 8·8 chains), £18,500. *Camberwell Green to Forest Hill Station* (3 miles 4 fur. 6 chains), £107,000. *Goose Green to Peckham* (1 mile 4 chains), £31,500. *Southwark-street to Westminster Bridge* (1 mile 2 fur. 7·7 chains), £45,000. *Waterloo-road* (1 fur. 7·1 chains), £6,500.

It was recommended that the Council make application to Parliament next session for powers to construct the lines. Consideration of the report was adjourned for a week.

Manchester.—The Tramways committee have completed arrangements with all the local authorities outside Manchester, except Salford, for the running of electric cars through their districts. Negotiations are proceeding with Salford, and when these are completed there will thus be one uniform tramway system for Manchester and district. Manchester will provide the cars and supply electric current for all places except Salford and Stockport. The Corporation of the latter town provides the current only, and Salford will furnish its own cars and current. The committee have decided on the form of pole for Cheetham Hill-road. The pole selected has been designed by Mr. C. H. Wordingham, city electrical engineer, is of mild steel, and stands 25ft. above the ground. The poles will be 100ft. apart, and on every second pole an arc lamp will be placed. The committee have also selected for trial three types of seats for the cars.

The Watch committee have approved a report from the Fire Brigade sub-committee recommending that the Gamewell system of fire alarms be adopted in the city. It will be some time before the system is installed.

Mansfield.—Mr. Robert Hammond has been appointed consulting engineer in connection with the proposal to establish electricity supply and refuse destructor works.

Marylebone (London).—The question of the purchase of the Marylebone portion of the undertaking of the Metropolitan Electric Supply Co. was again under the consideration of the Vestry last week. The special Electric Lighting committee submitted the report of three delegates appointed to confer and instruct the Vestry's solicitor in opposing the Marylebone Electric Supply Co.'s provisional order, which was thrown out on second reading in the House of Commons. It was recommended that the Vestry empower the committee to conclude negotiations with the Metropolitan Company for the transfer of its undertaking under the West London (Marylebone) electric lighting order, it being a condition of the contract that the figures supplied by the Metropolitan Company be verified by a chartered accountant and expert electrical engineer to be employed by the Vestry. Mr. W. Sutherland, who moved the adoption of the report, stated that upon an estimated expenditure of £500,000 in 1901 there would be a net profit to the municipality of £12,500, or a 2d. rate saved, after allowing 5½ per cent. interest on the £500,000, and 1 per cent. sinking fund. These figures were based on the profits shown by the company for 1900, up to June 20. He contended that if they took over the concern they ought to work at a considerable profit at once. They had no plant to lay down, and what was still better, no streets to pull up. It was the most advisable thing to conclude the negotiations. They had got the company down to the lowest price. The purchase money would be £400,000, and this sum could be borrowed. Dr. Fletcher Little seconded the motion, and Mr. Stringer criticised the report at considerable length. He was in favour of purchase if it could be done at a reasonable price. The sum they proposed to pay was prohibitive, and he appealed to the Vestry to pause before entering into it. The price they were going to pay was £916,666, or close upon a million of money, after making allowance for stock, redemptions, &c. They would be buying two sets of plant, a new set and an old set, which would be very little good. The station in Marylebone would be of very little use, it was principally used by the company as a distributing station, a great deal of current being obtained from other sources. Mr. E. Manville, the electrical expert, had told the old committee that the Vestry could not work the concern with the present generating station, and that they would have to expend £250,000 for this purpose. Further consideration of the question was adjourned.

Mexico.—The city of Hermosillo, on the Sonora river, with a population of 28,000, has well-equipped electricity works and current is supplied for both private and public electric lighting. Electric tramways traverse the town and extend to the adjacent mining districts.

Guaymas, a port on the Gulf of California, with a population of about 20,000, is also well lighted electrically, and has a system of electric tramways. The town of Guaymas is a rapidly rising one, and the harbour is one of the safest and best on the Pacific coast.

Monmouth.—An inquiry was held here last week into the application of the Corporation to borrow £28,000 as a supplementary loan for the combined electric lighting and drainage scheme.

Newfoundland.—The St. John correspondent of *The Times* states that Mr. Reid has transferred his extensive electric power franchises to a company with a capital of $1,000,000.

Para Rubber.—It is generally agreed that the best indiarubber at present on the market comes from Para, on the Amazon, collected from the seringueira variety of tree. Owing, however, to the abnormal unhealthiness of the districts in which it grows (the rubber gatherers perish in a very short time from fever) planters of rubber trees are advised by the British Consul at Bahia to turn their attention to the culture of the mangabeira and manicoba varieties of rubber plants exported from Bahia. Mangabeira grows almost in any soil in this State, and flourishes in quantities in sandy districts, where absolutely nothing else can be produced. In certain zones of the interior, fertile in good rich, red soil, the tree yields more than four times the quantity of milk than when growing on sandy lands. But notwithstanding these advantages, the manicoba tree shows advantages over all others that go to make it a commercial success. It is easily planted either from seed or saplings, grows in six or eight months in any kind of soil to a height of 6ft., and will begin yielding a considerable quantity of milk in about three years, far more in proportion than any other rubber tree in existence. One planter at Bahia has planted over 100,000 manicoba rubber trees, to be ultimately increased to 1,000,000 trees, and he expresses the full conviction that this industry will in a few years show extraordinary developments.

Pembroke (Dublin).—The Council have consented to the Dublin Corporation laying electric lighting cables through their district from the proposed Pigeon House Fort generating station to the city boundary.

Stourbridge.—The Destructor and Electric Power committee unanimously recommend the Council to retain their electric lighting powers, and to take immediate steps to put their provisional order into force.

Telegraphy in Argentina.—In order to meet the deficit in the National Telegraph department's budget for 1901 it has been proposed to impose a tax of 1c. a word on all messages passing over private telegraph lines.

Telephone Directory.—The National Telephone Co.'s directory of subscribers for 1900-1901 is issued. The great increase in the number of subscribers has necessitated resorting to a different shape for the new volume which is now made up in double columns in a much larger page. Even with this change the book is very bulky. There are 176,000 subscribers to the company's system.

The Post Office and the District Messenger Service.—The District Messenger Co. complain bitterly of the action of the Post Office in threatening to deprive the company of their licence to carry letters, which was granted by the Post Office to expire in 1903. The company allege that an attempt is being made to crush them out of existence in order to support the new telephone policy of the Post Office.

Tourist Guide to the Continent.—This is the time when those who have not already been away for a holiday are on the look out for a suitable spot. Those who find it necessary to seek other lands than their own cannot do better than secure a copy of the authorised guide to the Continent issued by the Great Eastern Railway Co., full of illustrations and interesting matter relating to places on the

Digitized by Google

Continent served by the Great Eastern Company's system and its Continental ramifications. The book is published at 6d.

Outing.—On Saturday a party of 70 of the Bolton Corporation Gas and Electric fitters, accompanied by the chairman and members of the electricity committee, Mr. Arthur Ellis, the borough electrical engineer, and Mr. R. Baker, gas and electric fittings superintendent, held their annual outing at Castleton.

TRADE NOTES AND NOTICES.

[*Notices for insertion under the above heading must reach the Office not later than first post Thursday morning. New Catalogues, Price Lists, and similar matter should be sent early in the week.*]

TENDERS INVITED.

Central Electric Supply Co. invite tenders for dry back marine boilers with mountings, feed and drain pipes, &c. (or, alternatively, water-tube boilers). Specifications may be obtained from the general manager (Mr. F. J. Walker), 19, Carnaby-street, Golden-square, London, W., and can also be seen at (but not obtained from) the office of Dr. Alex. B. W. Kennedy, 17, Victoria-street, London, S.W. Tenders to Mr. Walker by 10 a.m. of Aug. 20. An advertisement contains additional particulars.

Blackburn Corporation invite tenders for the supply and delivery of a traction switchboard. Specifications may be obtained at the office of the consulting engineers (Messrs. Lacey, Clirehugh & Sillar), 2, Queen Anne's-gate, Westminster, after 27th inst., and tenders must be delivered to the town clerk (Mr. Robert E. Fox), Town Hall, Blackburn, by Aug. 6. An advertisement contains further information.

Bradford Guardians invite tenders for an electric lighting installation at their workhouse. Specification may be obtained at the offices of the clerk (Mr. Thos. Crowther), 22, Manor-row, Bradford, after 30th inst., and further particulars are given in an advertisement. Tenders must be delivered at Mr. Crowther's office before noon of Aug. 13.

Bradford Corporation invite tenders for steel girder and steel trough rails and fish-plates. Tenders to town clerk by 28th inst.

Halifax Corporation invite tenders for mechanical stokers suitable for Babcock boilers. Particulars may be obtained from the borough electrical engineer (Mr. H. F. Street), Foundry-street, Halifax. See advertisement.

Halifax Corporation also invite tenders for combined steam engine and alternator, alternators, static transformers, induction motors, rotary converters, and three-phase extra high-tension switchboards. Tenders to town clerk by noon Aug. 6.

The *Pacific Cable* committee invite tenders on behalf of Her Majesty's Government, the Governments of Canada, New South Wales, Victoria, New Zealand, and Queensland for the manufacture and laying in the Pacific Ocean of 8,272 nautical miles of telegraph cable between Vancouver and Queensland. Forms of contract, &c., from and tenders to Messrs. Clark, Forde & Taylor, 4, Great Winchester-street, London, E.C., by noon 14th prox.

Barnes District Council invite terms from "free" wiring firms for wiring premises. Applications to clerk to Council, High-street, Mortlake, S.W., before 6th prox.

Tenders are invited for the electric lighting of the business premises of the *Ashington Industrial Co-operative Society*, at New Hirst. Particulars from secretary.

Grimsby Corporation invite tenders for wiring their electricity works. Specifications from town clerk, to whom tenders by Aug. 8.

Dorking District Council invite offers for leasing their provisional order. Tenders to clerk by Aug. 30.

Salford Corporation invite tenders for laying cables, tramway feeders, and street lighting. Tenders to town clerk by Aug. 13.

Rugby District Council invite tenders for leasing their provisional electric lighting order (1898). Applications to clerk by Aug. 1.

Stockport Tramways committee invite tenders for 20 double-deck tramcars with electrical equipment. Tenders to clerk by Aug. 31.

Torquay Council require tenders for additional generating plant. Tenders by Aug. 6.

The municipal authorities of *Moguer* (Huelva), Spain, invite tenders until Aug. 10 for the concession for the electric lighting of the town for 20 years. Tenders to el Secretario del Ayuntamiento.

Particulars are published in the *Madrid Gazette* of 20th inst. of a royal order approving conditions for the establishment and working of a telephone system in the town of *Ciudad Real*, Spain; 35 days are allowed for the presentation of tenders. The maximum time allowed is 20 years, and the successful tender will be that which stipulates the minimum time at which the property of the telephone service passes to the State.

TENDERS RECEIVED AND ACCEPTED.

The following tenders have been received by the Bridgwater Town Council for the supply and erection of electricity generating plant. The tenders are accepted subject to the Local Government Board sanctioning the necessary loan.

Section A.—Boilers.

Babcock & Wilcox (*accepted*)	£2,350 1 6
Crompton & Co. (Babcock)	2,383 0 0
Stirling Boiler Co. (watertube)	2,744 0 0
Tinkers, Limited (Economic)	3,567 0 0

Section B.—Steam Dynamos.

C. A. Parsons & Co. (Parsons turbine) (*accepted*)	£3,092 0 0
Ditto (Willans)	3,098 0 0
Thames Electrical Engineering Co. (Allen)	3,113 0 0
Ditto (Reavell)	2,905 0 0
Ditto (Willans)	3,185 0 0
General Electric Co. (Reavell engine)	2,709 15 0
Ditto (Willans)	2,944 15 0
F. Suter & Co. (Helios Co.) (Alley & MacLellan)	2,959 10 0
Lancashire Dynamo Co. (Alley & MacLellan)	3,048 0 0
Ditto (Browett)	3,088 0 0
Ditto (Belliss)	3,308 0 0
Thomas Parker, Limited (Willans)	3,365 0 0
Brush Co. (Willans)	3,370 10 0
Electric Construction Co. (Reavell)	3,382 0 0
Ditto (Willans)	3,590 0 0
Ditto (Belliss)	3,682 0 0
Clayton & Co. (Clayton)	3,434 0 0
Crompton & Co. (Willans)	3,442 0 0
E. Scott & Mountain (Scott)	3,520 0 0
John Fowler & Co. (Reavell)	3,537 0 0
British Schuckert Co. (Browett)	3,580 0 0
Mather & Platt (Willans)	3,583 0 0
Ditto (Browett)	3,643 0 0
Ditto (Belliss)	3,833 0 0
W. H. Allen, Son & Co. (Allen)	3,674 0 0
Ashton, Frost & Co. (Willans)	3,801 0 0
Siemens Bros. & Co. (Willans)	3,835 0 0

Section C.—Switchboard.

Hodgson, Wright & Co. (*accepted*)	£538 0	Verity's Limited	620 0
Evered & Co.	458 0	John Fowler & Co.	£639 0
Williamson & Joseph	514 0	P. C. Middleton & Co.	674 3
Lea & Warren	542 0	Clayton & Co.	678 5
Brook, Hirst & Co.	561 0	Crompton & Co.	698 0
General Electric Co.	575 0	Vaughan & Brown	767 0
J. D. F. Andrews & Co.	575 0	Mechan & Son	840 0
		Siemens Bros. & Co.	940 0

Section D.—Mains.

Western Electric Co. (*accepted*)	£8,301 19 5	Siemens Bros. & Co.	£10,913 4 11½
St. Helens Cable Co.	9,379 5 8	Oliver & Co.	11,311 15 0
W. F. Dennis & Co.	9,507 2 2	W. T. Henley's Telegraph Works Co.	11,442 0 2
Callender's Co	9,951 18 0	British Insulated Wire Co.	11,564 0 0
J. D. F. Andrews & Co.	10,844 19 11		

Section F.—Accumulators.

Hart Accumulator Co. (*accepted*)	£ 986	E.P.S. Co.	£1,369
Marquand Accumulator Co.	1,156	Chloride Electrical Storage Syndicate	1,402
Tudor Accumulator Co.	1,265	D.P. Battery Co.	1,446

Section G.—Crane.

Chatteris Engineering Co. (*accepted*)	£143 10	Mather & Platt	£155 0
Carrick & Ritchie	149 0	Carrick & Co.	158 0
		James Spencer & Co.	160 0

The following tenders have been received by the London County Council for wiring and fittings for the Fulham Fire Station :—

Tamplin & Makovski (*accepted*)	£235 4 6	Barlow Bros. & Co.	£243 0 0
Concentric & General Contract Co.	243 0 0	F. A. Glover & Co.	260 0 0
		F. J. Coleby	273 5 0
		G. E. Taylor & Co.	298 0 0

Beckenham Council have received tenders from the following firms for the "free" wiring of premises in the district: L. Tate, Chas. Peacock & Co., Buchanan & Curwen, Concentric & General Contract Co., National Electric Wiring Co., and Electric & General Engineering Co. The tender of Roger Dawson for wiring the institute at £240. 13s. 5d., that of Tamplin & Makovski for wiring the baths at £277. 4s., and that of Foster Bros. for the erection of a transformer station have been accepted.

The London County Council has accepted the tender of Mr. T. Scott Anderson (£8,700) for wiring and supplying fittings, &c., for the electric lighting of Horton Asylum. The building work in connection with the Horton Asylum station for the supply of electricity and water is to beundertaken by the Works Department of the Council.

Five Belgian firms competed for the contract for the establishment and equipment of a municipal supply station at Jumet (Belgium). Tenders ranged from 223,650fr. to 518,000fr., the lowest being that of the Société Electricité et Hydraulique of Charleroi.

Digitized by Google

Bradford Corporation have accepted the following tenders for the supply of additional plant for their electrical undertaking, subject to the Local Government Board sanctioning the necessary loan: Cole, Marchent & Morley (two steam engines); British Westinghouse Company (two 1,000kw. direct-current generators); S. Z. de Ferranti (Ltd.) (switchboard); E. Newell & Co. (coal and ash conveying apparatus); Babcock & Wilcox (steam and feed piping).

Liverpool Select Vestry have accepted the tender of Messrs. Campbell & Isherwood for an electric lighting installation (about 100 lights) at the parish offices, Brownlow-hill.

APPOINTMENTS VACANT AND FILLED.

Bolton Corporation invite applications for the post of electrical engineer to take charge of their electric lighting and tramway undertakings. Further particulars are set out in an advertisement, and applications must be delivered to the town clerk (Mr. R. G. Hinnell) not later than 30th inst. The Corporation are offering a salary of £500 per annum, with annual increments of £50 to a maximum of £700.

Manchester Tramways committee require an experienced traffic superintendent. Applications to chairman of committee, Town Hall, Manchester, before 28th inst.

An assistant is required in the engineering department of the Merchant Venturers' Technical College, Bristol. Applications to registrar by Aug. 13.

Mr. Thomas Rolls, of Leicester Corporation electricity works, has been appointed chief generating assistant at the Poplar (London) electricity works.

Mr. S. C. Gibson, second engineer, has been appointed to the position of chief assistant at the Wimbledon electricity works, and Mr. Russell Hudson has been appointed assistant engineer. There were 47 applications for the latter position.

Mr. L. M. Jones, B.Sc., A.R.C.Sc., science master at St. Dunstan's College, Catford, has been appointed headmaster of the day school of the Birmingham Municipal Technical School at a salary of £300 per annum.

Mr. F. G. Richardson, of Nottingham, has been appointed Superintendent of postal telegraphs at Grimsby.

Dr. R. S. Clay, late lecturer in physics at the Birkbeck Institution has been appointed principal of the Wandsworth Technical Institute.

BUSINESS NOTICES.

Increase of business has for some time past required large additions to the works of the Blackman Ventilating Co., at Holloway, and the company is now concentrating and removing its central offices to 443, Holloway-road, London, N. The Fore-street offices will be retained for the London district engineering representatives, but all correspondence is to be sent to Holloway.

Messrs. Geipel & Lange have been appointed sole British agents for the Ward Leonard Electric Co., Bronxville, N.Y., U.S.A., whose manufactures include motor switches, circuit breakers, theatre dimmers, &c., &c. A large assorted stock will be kept in London.

The Klein Engineering Co. has received an order through Messrs. Dick, Kerr & Co. for the supply of condensing plant for the power station of the Calcutta electric tramways. The plant is designed to condense exhaust steam from engines of about 2,000 H.P. and consists of surface condenser with Edward's air pumps and motor-driven circulating pumps.

BANKRUPTCIES, LIQUIDATIONS, &c.

Paris Singer (Ltd.) is to be wound up voluntarily, and Mr. S. H. Baldry, 52, Portsdown-road, London, W., is liquidator.

A first and final dividend of 15s. 5½d. is payable (any day except Saturday) at the official receiver's office, 33, Carey-street, London, W.C., in the liquidation of the Chitty Dynamo & Motor Co. (Ltd.)

The liquidator in the liquidation of the London Provincial Electrical Co. (Ltd.) has been released.

A petition has been presented to the Court of Session, Edinburgh, for an order to continue the voluntary winding up of P. C. Middleton & Co. (Ltd.), electrical engineers, Aberdeen.

Air Compressors and Hoists.—Messrs. Reavell & Co., Ipswich, have just issued a new catalogue of air compressors and hoists manufactured under the firm's patents. These machines are of the high-speed type specially designed to work quietly at a fairly high speed of revolution, and to give a continuous supply of air, so as to reduce the size of reservoirs at present used with pneumatic equipments. The compressors are designed for electric, belt, or steam driving. The list contains good illustrations of several electrically-driven machines.

Feed Water Filters.—A new list is to hand describing several types of patent feed water filters for land and marine boilers manufactured by the Rankine Patent Feed Water Filter Co., of Liverpool. The catalogue is fully illustrated, and contains a list of electrical plants which have been fitted with these filters.

"General Electric" Plant.—Two supplements are issued by the General Electric Co. to section A of their large catalogue, one dealing with enclosed and open type multipolar motors from 3 H.P. to 25 H.P., and the other describing reversible automatic lift controllers and motor-driven starters for presses, lathes, tools, &c. At a time when electric driving is being extensively applied to small machinery, lifts, &c. the particulars published will be found of service.

Exports of Electrical Apparatus and Material.—The following list gives official particulars of the exports of British manufactured electrical apparatus and material (including telegraph and telephone wire and material, but not including electrical instruments or machines, which are not separately specified) from July 18 to July 24, with the ports of destination:—

Africa—Alexandria, £32; Cape Town, £130; Durban, £261. *Argentina*—Buenos Ayres, £3,101 (including £1,332 telegraph material). *Australasia*—Adelaide, £104; Launceston, £191; Perth, £60; Sydney, £354 (including £174 telegraph material). *Belgium*—Ostend, £390. *Brazil*—Rio Janeiro, £1,512 (including £682 telegraph material). *Ceylon*—Colombo, £26. *Chili*—Boca, £197 (telegraph material). *China*—Shanghai, £180. *Colombia*—Santos, £252. *Denmark*—Copenhagen, £262 (telegraph wire). *France*—Calais, £45. *Germany*—Hamburg, £500 (telegraph material). *Holland*—Amsterdam, £75. *Hong Kong*, £75 (including £51 telegraph material). *India*—Bombay, £45; Calcutta, £1,093 (including £182 telegraph wire); Madras, £17. *Italy*—Genoa, £21. *Japan*—Yokohama, £475. *Norway*—Christiania, £39 (telegraph wire); Christiansand, £63 (telegraph cable). *Siam*—Bangkok, £148. *Straits Settlements*—Singapore, £2,006. *Sweden*—Stockholm, £59 (telegraph wire). Total £11,622, against £56,769 in the corresponding week last year (July 19 to 25).

PATENT RECORD.

The following list of Applications for Patents and Specifications published has been compiled for this journal by Messrs. J. C. Chapman and Co., *Chartered Patent Agents, of 70, Chancery-lane, W.C., from whom any available information in connection with Patents, Designs, and Trade Marks may be obtained.*

APPLICATIONS FOR PATENTS.

Note.—*The undermentioned Applications are not open to public inspection until after the acceptance of the complete Specification. The names within parentheses are those of communicators of inventions. When complete specification accompanies application, an asterisk is affixed.*

May 9, 1900.

8,531. J. T. Pearson. Burnley. Improvements in trolleys for electrically-driven tramcars, motors, and the like.

8,541. W. F. Jones. Hammersmith. Improvements in electromagnetic mechanism.

8,558. R. B. Roxby. London. Improvement in electric incandescent lamps.

8,575. F. Greening. London. The manufacture of an improved material for insulating electrical conductors, waterproofing fabrics, and for other purposes.

8,576. A. Hebblethwaite. London. Improvements in and connected with electric lamps for lighting billiard tables.

8,584. G. Tosi, M. Tullio, De Felice, and A. Parboni. Liverpool. An improved system of electric traction by surface contact.*

8,586. C. Martin. London. Improved galvanic battery.*

May 10, 1900.

8,610. H. Cheshire. Birmingham. Improvements in chains for electric light fittings.

8,611. W. F. Jones. London. Improvements in electrical apparatus.

8,642. H. W. Butler. London. Improvements in means for regulating pressure in electric mains.

8,656. W. A. Stevens and R. A. Barker. London. Improvements in connection with cut-in-and-out electric switches for accumulator systems.

8,668. The Interstate Electric Co. and J. Melzer. Strand. Improvements in electric arc lamps.

8,671. E. Schulz. London. Improved construction of electric switch.

8,678. A. U. Alcock. London. Improvements in or relating to electrical signalling apparatus.

8,682. R. W. Covant. London. Improvements in apparatus for measuring electrical resistances, and chiefly intended for testing the electrical resistance of rail joints in the tracks of electric railways. (Date applied for under Patents, &c., Act, 1883, sec. 103, Nov. 13, 1899, being date of application in United States.)*

May 11, 1900.

8,704. F. W. Carter. Birmingham. An apparatus for facilitating the photometry of arc lamps and like sources of light.*

8,719. F. W. Goldby. London. Improvements in electric circuit breakers. (A. Beyer and R. Schön-Felder, Germany.)

8,754. M. Forkas. London. Improvements in electric switches.

May 12, 1900.

8,779. J. Whitcher, A. H. Lea, and C. H. Warren. Kettering. Improvements in electric switches and fuses.

8,780. E. Eugene-Brown. Newcastle-on-Tyne. Improvements in dynamo-electric machines.

8,781. W. Snelgrove. London. Improvements relating to electric cash register tills.

SPECIFICATIONS PUBLISHED.

NOTE.—All Specifications can now be obtained at the uniform price of 8d. each.

1899.

7,284. DARDEAN. Telegraphic telephone and like systems and automatic switching apparatus therefor. (Date applied for under International Convention, October 10, 1898).

8,693. ABEL. (Soc. Anon. pour la transmission de la Force par L'electricité.) Converting transformers.

9,882. PRESTON and GILL. Electric lighting apparatus, especially applicable for railway and other vehicles.

10,029. DOUGLAS. Controlling of shop window illuminating electric lamps and the like.

10,241. IMRAY. (Oesterreichische Gasglühlicht and electricitäts-Gesellschaft.) Electrical incandescence lamps with osmium filaments.

11,166. MARINO. Electrolytes for deposit of metals.

11,747. BOWLEY. Telephones, phonographs and such like apparatus.

12,949. ANDREWS and GLASS. Connection of house-service or branch conductors to electric mains.

13,136. KINGSBURY (Western Electric Co.). Appliance for telephone pay stations.

13,194. TOMKINS. Method of winding coils for continuous-current dynamo and motor electric machines.

13,561. BARREAU. Means to be employed in electric traction.

13,939. MILNES. Electric railways and tramways on a sectional conductor system.

14,010. SWINBURNE and STEARN. Means for use in the production of radiation and light by electricity.

14,328. WISE (Actiengesellschaft Electricitätswerke vorm. O. L. Kummer & Co.). Insulators for the overhead conductors of electric tramways.

14,408. HARDINGHAM (firm of Felten & Guilleaume). Submarine cables.

COMPANIES' MEETINGS AND REPORTS.

Direct United States Cable Co. (Ltd.).

The forty-sixth ordinary general meeting of this Company was held at Winchester House, Old Broad-street, on Tuesday, under the presidency of Mr. E. M. UNDERDOWN, Q.C.

The GENERAL MANAGER AND SECRETARY (Mr. T. Finnis) read the notice calling the meeting, and the minutes of the last meeting, and the report of the Directors was taken as read.

The CHAIRMAN: Gentlemen, I have very few remarks to make to you to-day. A country is said to be happy when it has no history, and the same remark may be made with respect to our cables, we having been fortunate enough in the period under review not to have required any repairs. This is an extremely favourable incident to have to report. The revenue for the half-year under review, after deducting outpayments, amounted to £52,204, while the working and other expenses, including income-tax, absorbed £20,506, leaving a balance of £31,698 as net profit, making with £6,347 brought forward from the previous half-year, a total of £38,045, which has been appropriated as follows: interim dividend of 3s. per share to March 31, £9,106. 10s.; proposed final dividend of 3s. per share to June 30, together with a bonus of 2s. per share, £15,177. 10s.; transferred to reserve fund account £10,000; balance proposed to be carried forward, £3,761, making together the figure of £38,045. The revenue shows the small improvement of £253 as compared with that in the corresponding period of last year. The working expenses in London, the details of which will be found in abstract "A" of the accounts, show a reduction of £305, while those at the stations, as shown by abstract "B," are £88 higher, the result being a net saving of £217 in the ordinary working expenditure; but the item of income tax, as we are all aware, has absorbed a certain additional amount of our profits, and the outgoings, taken on the whole, including that, show an increase of £95. Practically, therefore, as you will see, the results of the working of the past half-year are the same as for the corresponding period of last year. We have had, as I have mentioned before, no interruption to the cables, and therefore we have not had to draw anything from the reserve fund. This fund has been increased by £10,000 from the revenue account, by £6,782 interest on the investments, and by £399 sundry profit and other items, bringing the fund up to a total of £418,875. The investments have been increased by £21,206, and they now amount to £401,807 at cost, their present market value being about £25,000 higher than their cost. No doubt, as you are all aware, although our securities have, as I think, been chosen with the greatest possible care, and have, as a whole, turned out to be very well selected and dealt with, as we have been able to deal with them, yet the profit upon them is not so large by a considerable sum as it was a few years ago. In point of fact, we know—it is a strange thing—that some of the largest differences in the prices of securities have been in those of the very best class. However, our investments still show a substantial profit, and when the present depressed state of things has passed over, I trust that they will show a more satisfactory increase over their cost price than they do at this moment. The result of the whole financial year's working is a revenue of £109,004. Deducting the expenses, £40,923, a surplus is shown of £68,081. That has been paid away, as far as dividends are concerned to the amount of £42,497; there has been placed to reserve £25,000, and there is an increased balance in hand of £584. As far as our service is concerned, it has been conducted with great regularity and success. Our relations with our allied companies have been exceedingly good, as is always the case; and all that we have to show is that we are holding our own, and endeavouring to hold our own, although the increase of cables across the Atlantic is an important matter, to which we cannot remain indifferent. As soon as the German cable is opened there will be 13 cables working across the Atlantic, and when the shorter section from Nova Scotia to the Azores is completed, there will be practically 14 cables across the Atlantic. All we can do is to conduct our business in the best manner we can, combined with our friends, and endeavour to keep our position, as we have succeeded in doing up to the present, as sure as possible. With respect to relations with Germany they remain much the same as when I last addressed you, because, although the contract between the Anglo Company and the German Government is, so to speak, at an end, yet messages are still being transmitted over the German cable connecting that country with the Atlantic cables of the Anglo Company at Valentia; but of course, we cannot expect that that arrangement will continue indefinitely. As I have informed you before, our attention has been very closely directed to this matter, and we have had many interviews in very influential quarters; and we trust that, as far as possible, the interests of the pooling companies will be protected. I now move that the report and accounts be adopted, and the dividends as set out in the report be approved.

Sir JAMES PENDER, Bart., M.P., seconded the resolution, which was carried unanimously without discussion.

Mr. Charles E. Gunther and Admiral of the Fleet the Hon. Sir Henry Keppel, G.C.B., D.C.L., were re-elected as directors, and the auditors, Messrs. Deloitte, Dever, Griffiths & Co. and Messrs. J. and J. Sawyer & Co., were re-appointed.

A vote of thanks to the chairman and directors terminated the proceedings.

National Telephone Co. (Ltd.)

The twenty-sixth ordinary general meeting was held at the City Terminus Hotel, Cannon-street, yesterday (Thursday) under the presidency of Mr. JAMES STAATS FORBES.

The SECRETARY (Mr. Albert Anns) having read the notice calling the meeting,

The CHAIRMAN said he had occasion at the last meeting to regret the very sparse attendance of shareholders, but he thought that the attendance on the present occasion was even more sparse. The interpretation which the directors put upon this fact was that the bulk of the proprietors were satisfied with the directors' action. He might say a great deal if it were desirable to enter into the future or to anticipate the unknown, but he proposed to be very reticent on everything connected with the unknown, and to deal simply with what they knew—the results of the half-year's working. He thought the figures spoke very intelligibly for themselves, and required very little elucidation. The income had increased, as had also the working expenses, in rather a larger proportion, this being attributable to the fact that they had had one of those casualities incident to their business—a snowstorm which involved an expenditure of about £25,000. The directors had thought it better at once to charge this to the half-year's revenue, a proceeding which would affect not what they would pay in dividend but what they would carry to reserve. The increase in the income was £97,500; the working expenses had been more by £77,000, including the £25,000 mentioned; and the result was an increase of about £11,000 in the net result of the half-year, which would have been £36,000 but for the exceptional item of £25,000. The board proposed to pay the dividends as usual upon the first, second, and third preference shares, and a dividend of 6 per cent. per annum (less tax) on the ordinary shares, and they would transfer £55,000 to reserve. This was a lower figure than they had added to this fund in any half-year for some time, but the amount must be remembered in connection with the £25,000 of extraordinary expenses. The Post Office royalties for the half-year amounted to the enormous sum of £68,357, being an increase of £9,472 compared with the amount paid in the June half of 1899. The net income had increased by £88,000, the working expenses by £77,000, and the net result for the half-year was £227,262, or £11,000 increase over June, 1899. The working expenses had gone up from 60·22 per cent. to 64·02 per cent., of course taking in the £25,000 of exceptional expenditure. This just about brought the percentage of working expenses to net income to the same average as before. The amount brought forward was about £2,000 less; the debenture and other interest had increased by £14,913, because in the interval the directors had raised debentures, the interest on them had been paid up to date, and the preference and ordinary dividend was larger by £5,000 because a portion of the ordinary stock sanctioned by the stockholders had been issued. The amount transferred to reserve was £55,000, or £5,000 less than they added in June 1899, and the amount carried forward was about £6,000 less. In order that the proprietors might receive their profits as early as possible the present half-year was treated as a provisional half-year—that was to say, the accounts were not made up and strictly audited for more than five months, and, with the sanction of the auditors, the results for the month of June were estimated. This enabled the directors to meet the proprietors very early, and to present them on the following morning, if they approved the proposed dividends, with cheques for the amount due to them. He thought it better to explain this, as the matter was referred to in the auditors' certificate. He had received certain correspondence from a few of the shareholders with reference to the deduction of the income tax, and he would therefore remind them that at their meeting last February he had referred to the matter. He need not say that no board of their character lightly departed from any course which they had previously followed; but they had made up their minds that they could no longer, consistently with their duty to the general body of shareholders, continue to pay income tax *plus* the dividend on the ordinary shares. When matters such as this came prominently before them, they had to consider their powers and obligations—and the directors were vested with large powers of discretion as to reserve funds. The directors had come to the

Digitized by Google

conclusion, to get rid of the anomaly that had existed, that the ordinary shareholders should pay their own income tax. They had received nine letters from different shareholders enclosing their proxies, but attaching to the latter this instruction: "These proxies are not to be used if the board insist upon deducting the income tax." Of course, the directors would not use these proxies on any vote that might come before the meeting; but he might state that, on the other hand, they had received an enormous number of proxies from shareholders who expressed no dissent from the directors' intentions in this matter.

Probably the shareholders would like to know a little as to the future. The directors had had numerous communications with the postal authorities as to the future. They had been as reasonable as they could, and they had been as anxious as men could be to work in harmony and to work loyally with the Post Office on the principle of competition. There had been proposals and counter-proposals but up the present there was no result. The directors hoped, and they had reason to hope, that the competition would be conducted rationally and fairly, and they felt confidence in those pledges on which men of honour relied when given on authority by responsible politicians or officials. Mr. Hanbury was the Chairman of the Parliamentary Committee who sealed the company's fate—that was to say, who determined that there was to be competition, and that the company must put up with the brunt of it. Mr. Hanbury showed during the negotiations that he was a most admirable negotiator, who knew very well how to take care of the interests of the State, and who always showed a great disposition to act on the square; and Mr. Hanbury's public utterances must be taken to be Mr. Hanbury's intentions. These were specific. On June 21, 1899, in the debate on the second reading of the bill which sealed the company's fate, in the sense of their having to accept competition Mr. Hanbury "frankly recognised that the National Telephone Co. had done good work, and wherever it had got wayleaves and could give an efficient service, serving all alike, on equal terms, he should be sorry to see that system discontinued. What we wanted in this country was a general system that would extend itself over the whole country. . . . He would do the National Telephone Co. the justice to say that wherever they got the opportunity they gave an efficient serivce—that was to say, where they had underground wayleave and a double circuit system. . . . He was most anxious that they should treat the company with absolute fairness." Those were words which the directors relied upon. He had some colleagues on the board who were quite as eminent as Mr. Hanbury as public men, and they relied upon these utterances. Then, on the consideration of the bill—on July 24, 1899—Mr. Hanbury said: "The Committee and all those who had looked into the matter strongly recommended that wherever they introduced competition they should do their best to deal equally between the company and the new competitor. . . . We did not think the honourable and learned member would wish them to confiscate any of the rights of the National Telephone Co. . . . He had refused to be a party to anything in the nature of confiscation." Well, the board wanted fair treatment as between the competitors, whoever they were and wherever they were, and they of course would not desire to be treated other than as fairly as their competitors; they would shrink from conceiving it possible that any act of the Government would lead by any possibility to any want of recognition of what the company had done, of what they might have done had they not been hampered—and of what they were willing to do to co-operate cordially with the Government in making the service as efficient as possible; and they would be likely to resent anything like confiscation. He concluded by moving a resolution adopting the report and accounts and declaring the dividends recommended.

The Right Hon. Lord HARRIS, G.C.S.I., G.C.I.E. (vice-president), seconded the motion.

In reply to Mr. Lewis,

The CHAIRMAN stated that the item in the balance-sheet of "less amounts paid in advance for Post Office royalties, £68,727," was the company's payment for Post Office royalties for the half-year. If the shareholders looked at the abstract of the accounts they would see that the following payments had been made by the company to the Post Office for royalties:—For 1894, £67,000; 1895, £74,000; 1896, £79,000; 1897, £89,000; 1898, £104,000; 1899, £123,000; and as regarded the current year the amount would, of course, be much more on the basis of the first half-year's payment. This was a pretty heavy sum to pay for the privilege of being competed with by the people who received the money, but that was the bargain. They had already paid in royalties something over £600,000, and they would have to go on making similar payments. They were pitted against a competitor who took 21 per cent. of the profits clean out, without doing anything for it, and who competed with them at the same time.

The motion was carried unanimously, and the retiring directors and auditors were afterwards re-elected.

Mr. EDWARD CHAPMAN proposed a vote of thanks to the chairman, directors and staff generally for their able management of the company's business.

Mr. LEWIS, in seconding the motion, referred to the difficulties of conducting such a business, and remarked that it was fortunate that the company were served by one of the ablest boards of directors which could be found in the country.

The CHAIRMAN, in reply, said such votes were not only pleasant to the directors and the staff, but they also cast upon them a great responsibility. The officers of the company had very properly been included in the vote. He did not know how they would get on without their admirable general manager (Mr. W. E. L. Gaine); and they had an equally admirable secretary and an engineer of the greatest ability. The staff, including the ladies, certainly deserved the thanks of the proprietors and the considerate treatment of their customers.

The proceedings then terminated.

British Thomson-Houston Co. (Ltd.).

A meeting of this company was held on Monday, under the presidency of Mr. E. A. LAZARUS.

The ASSISTANT SECRETARY (Mr. Alfred Clements) having read the notice calling the meeting,

The CHAIRMAN said: The books of the company were very full of orders and he was pleased at the basis of those orders. Among the orders they had in hand might be mentioned the following: Birkenhead, Blackburn, Bristol City tramways, Croydon, Dublin City tramways, Glasgow, Huddersfield, Hull, Leeds, London United Tramways, Newcastle, Queenstown lighting, Sheffield, Tynemouth, Isle of Thanet, and several other orders of a smaller description. Satisfactory progress was being made with their works at Rugby. As they were beginning to pay for parts of these works, the directors had decided to make a call of £2. 10s. per share on Sept. 1, making £6 called up, and they would probably make a further call of £4 in two calls of £2 each at intervals of two months. There were two points which he would like to take that opportunity of expressing an opinion upon. The first was that consulting engineers would in most cases find it to the best interests of their clients to endeavour to obtain standard plant. Of course, he knew there were cases where special plant had to be used, but he thought that in the majority of cases it would be found very much more to the advantage of all concerned—to the manufacturer and to the buyer alike—if consulting engineers, instead of using any special type, were to adhere to the plant of some standard manufacturers, because in that way they would obtain cheaper and better plant. With reference to the second point, it was not without some misgivings that they noticed the tendency of municipalities to accept the lowest tender—a proceeding which was calculated to lead some of the less important firms in the trade to tender at prices and run risks out of proportion to the work to be done. This of course was to the advantage neither of the buyer nor of the seller. They could, of course, understand the difficulty that municipal bodies were in when called upon to vote money for highly technical matters like electrical plant; but, for all that, the system did not in reality make for their obtaining the best value for their money, because a smaller sum spent at the outset often meant a very much larger outlay in the long run, through the cheaper plant not being as efficient, and therefore costing more for maintenance and repair. As far as their company was concerned, they did not feel inclined to be too much alarmed at this state of affairs, although during the past year they had seen several important contracts go past them. The report and accounts were carried unanimously, and the following dividends for 12 months to March 31 last approved:—

On the £240,000 ordinary shares fully-paid of 10 per cent.; on the £160,000 ordinary shares (£16,000 paid up from Aug. 16, 1899) at the rate of 10 per cent.

The motion was seconded and carried.

The retiring directors and auditors were afterwards re-elected.

The directors report submitted at the above meeting stated that the Central London Railway, the whole electrical equipment for which was carried out by the company, was opened on June 27. The Cork Electric Tramways & Lighting Co., the complete equipment for which was also carried out by the company (payment being taken in shares and debentures) paid a dividend of 5 per cent. on the ordinary shares for its first year's working. The royal assent to the Chatham and District Light Railways Bill (promoted by this company) was given in August last. A suitable site for the power station has been acquired, and work is progressing satisfactorily. In pursuance of the policy adopted by the board, the directors have decided to open branch offices in Newcastle and Manchester. The report refers to the recent litigation in which the company was involved—viz., the Sprague motor suspension and Hookham meter patents, and states that notice of appeal has been given by the plaintiffs in the latter case.

A fresh issue of 16,000 £10 ordinary shares was taken up by existing shareholders in August last at a premium of £2. 10s. per share, and the premium (£40,000) has been placed to reserve. All matters in connection with the old company are wound up, the final losses upon or in respect of contracts taken over having been determined and entirely written off. The profits, after deducting general and technical expenses, discounts, and interest, amounted to £52,310. 10s. 1d.

Rand Central Electric Works (Ltd.).

The directors' report for the year ended Dec. 31, 1899, states that in consequence of the war business and mining work were brought to a standstill early in October, and as the company depends for its revenue upon these sources, it must be considered a favourable feature that it was at least able to pay its expenses during the last quarter of the year. The total revenue was £50,674. 9s. 1d., compared with £43,208. 14s. 6d. in 1898, and the working costs to £49,834. 11s., compared with £48,951. 3s. in 1893. The profit amounts to £839. 18s. 1d., of which £83. 19s. 9d. is carried to reserve, against a loss of £5,742. 7s. 6d. in 1898. The receipts for power supplied amount to £49,640. 7s. 7d. against £42,723. 3s. The installed power rose from 1,846 H.P. to 2,219½ H.P. On the basis of revenue actually earned, the amount of power per annum supplied works out at an average load of 1,103 H.P., which rose to 1,541 H.P. before the outbreak of hostilities, and after the outbreak fell away at one time to 524 H.P. As anticipated, a considerable improvement in the working of the main line has been brought about. A further expenditure of £1,375. 5s. 7d. was incurred to increase the water supply of the company.

Under the equipment contract Messrs. Siemens & Halske guaranteed that the profits of the company should be sufficiently large to provide dividends of 6 per cent., 8 per cent., and 10 per cent. per annum respec-

Digitized by Google

tively for the years 1897, 1898, and 1899. The necessary amounts to provide the guaranteed dividends for 1897 and 1898 were duly paid, and the one now under consideration is due; but in regard to the profits for 1899, Messrs. Siemens & Halske claim a partial release on account of the hostilities in South Africa constituting a case of *force majeure*. Although the equipment contract makes no provision for a possible war, the directors are of opinion, after due consideration of all the vital points, that there is room for an amicable arrangement, which they advocate in the interest of the shareholders, and in this they are supported by the members of the local board, to whom the whole matter had been submitted. The board propose the following basis of adjustment in respect of the profits of 1899: The dividend guarantee to remain in force, subject to an allowance being made to Messrs. Siemens & Halske for the loss in receipts directly traceable to the war. In order to arrive at the amount of this loss it is proposed to assume that the working expenses and receipts for the last three months of the year would, but for the war, have been the same as those for the three months prior to the outbreak of hostilities—*i.e.*, July, August, and September. This would show the net loss for Oct.–Dec., 1899, to be £7,371. 13s. 7d., and the directors propose to relieve the contractors of the necessity for paying this amount, and ask for the shareholders' sanction. The liability of Messrs. Siemens & Halske for the year ending Dec., 1899, would thus be reduced to £21,872. 8s. 1d., and there would be £22,628. 6s. 5d. available for distribution amongst the shareholders. Subject to this recommendation being adopted the directors propose a dividend of 7½ per cent. be declared for the year 1899, payable when payment by Messrs. Siemens & Halske is made.

Mr. R. Charubin has resigned his seat on the board, and a further vacancy has occurred through the death of Mr. A. Barsdorf. Mr. G. von Chauvin has been elected a director to fill one of the vacancies, and the board proposes shortly to fill the other vacancy.

An interesting and exhaustive report from Mr. G. Gorrissen, the general manager at Johannesburg, follows. We extract the chief points:—

The amount of electric power distributed gradually rose, and in April we had the satisfaction of having to run a third engine during the night hours; while in August and September the maximum load rose at times to 85 per cent. of the total capacity of the plant. Negotiations for the extension of old and the connection of new installations, which would well nigh have exhausted the full capacity of the plant at its maximum load, were being carried on, when the war put a stop to all further business. The plant was kept running during the war in order to supply the wants of such of our customers as required power. Altogether the plant has worked very satisfactorily, the stoppages due to external influences only amounted to 68 hours 34 minutes for the year. In addition to the stoppages of 68 hours 34 minutes, the supply was also stopped for 85 hours 55 minutes to carry out alterations and improvements. The most important cause was the breakdown of insulation, which includes the effect of lighting.

The maximum output for any one day occurred on Sept. 28, and amounted to 30,815kw. hours. We have at present in the station four steam engines and dynamos of a normal capacity of 700kw. Of these, one engine and dynamo have to be considered entirely as reserve plant, so that the normal capacity of the station amounts to $3 \times 700 = 2{,}100$kw. The maximum load during August and September has been about 1,800kw., corresponding to 86 per cent. of the normal capacity of the plant. The largest demand was during September. The actual output amounted to 844,525kw. hours, or about 56 per cent. of the plant capacity.

Taking the equivalent horse-power value for the lighting plants 1,846 H.P. were connected in Dec., 1898, and 2,289·5 H.P. in Dec. 1899, of which, however, 70 H.P. represents a temporary installation, thus showing an actual increase of 373·5 H.P. during the year. The principal improvement at the installations connected to the system is the erection of a system of automatic regulators for the larger lighting plants. These regulators have worked very satisfactorily.

City & South London Railway Co.

The report of the directors for the half-year ended June 30 states the receipts from all sources for the past half-year amounted to £35,144. 18s. 2d., and the cost of working to £20,860. 12s. 8d., leaving a profit of £14,284. 5s. 6d. Inclusive of the balance forward the net revenue account shows a total of £18,366. 12s. 2d. After making provision for debenture stock interest, a balance remains of £13,215. 4s. 7d., and the directors recommend that the full dividend of 5 per cent. per annum be paid on the preference stocks, 1891, and for four months on those of 1896 (the other two months being charged to capital as authorised), and that a dividend at the rate of 1½ per cent. per annum be paid upon the consolidated ordinary stock, leaving £788. 2s. 11d. to be carried forward. The number of passengers (exclusive of season ticket holders) carried during the half-year was 4,169,717 and the receipts (including season tickets were £33,608. 2s. 3d. For the two preceding half-years the figures were 3,442,942 and £26,749. 3s. and 3,540,098 and £26,197. 14s. 10d. respectively.

The diminution in the dividend is largely attributable to the increase in the debenture and preference charges before the recently-opened extensions have had time to develop their traffic. There has also been a considerable increase in the cost of coal, wages, and materials. The extensions to Moorgate-street and Clapham Common were opened for traffic on Feb. 26 and June 4 respectively. The receipts have already been considerably augmented, and are steadily improving. The extension to Islington is being rapidly proceeded with, and it is hoped will be ready for opening about March. The Central London Railway not having yet been opened for public traffic, the joint subway constructed for the exchange of traffic between the two companies at the Bank station has not been brought into use. The joint subway with the Brighton Company at London Bridge is in course of construction. The additions and alterations at the generating depôt are practically completed, and the further plant required for the Islington extension is in hand. In preparation for the opening of this portion of the line 10 additional locomotives have been ordered.

The bill promoted by the company in the present session has received the royal assent. The consent of the proprietors has been obtained to an arrangement between the company and the Baker-street and Waterloo Railway Co., who are obtaining powers to extend their line to the Elephant and Castle station, where it is proposed to have a subway communication between the two systems which will, it is hoped, result in a large exchange of traffic.

Resolutions are to be submitted to the shareholders varying the present agreement with the City and Brixton Company, with the view of facilitating the raising of the capital of the company. The offices of the company are to be removed to the new station buildings at Moorgate-street.

Crompton & Co. (Ltd.).

The report of the directors for the year ended March 31 states that the profit amounted to £31,326. 19s. 6d. After providing for debenture interest, payment of interim dividend, &c., there remains a balance of £24,636. 14s. 10d. It is proposed to set aside £2,500 as provision for doubtful debts, to place £12,000 to reserve, to pay a dividend at the rate of 9 per cent. per annum for the half-year, tax free, making (with the interim dividend paid in January last) 7½ per cent. for the year, and to carry the balance (£3,729. 18s. 11d.) forward. The reserve fund now stands at £25,046. 9s. 9d., and the directors propose to set aside from this account £5,000 as a special contingency fund, to provide for any possible shrinkage in value of investments, to write off £5,000 from goodwill account, £5,000 from the patents account, and £3,000, balance of the cost of establishing the electric cooking department, carrying the balance (£7,046. 9s. 9d.) forward. The whole of the 21,902 shares offered for subscription in July last year were taken up, and the premiums have been carried to reserve. The board have purchased an additional 10½ acres of freehold land adjoining the site of the new works. They have considerably extended the main shop at these works, which is now being equipped with the necessary machinery, and have also erected a detached pattern store. The report states that the business of the company continues to progress in a most satisfactory manner, and the order book is very full. The Chelmsford Electric Lighting Co. have hitherto been occupying a portion of the old works at Chelmsford for a generating station; a formal conveyance of the freehold, together with the plant and machinery therein, has now been made to the company. The administration of that company has been re-organised during the year, and it is believed that the results for the current year will show considerable improvement. This undertaking is earning a moderate but steadily increasing revenue, and the directors are of opinion that this improvement will continue.

Dublin United Tramways Co. (1896) Ltd.

The directors' report for the half-year ended June 30 states that after meeting debenture interest, &c., £36,039. 13s. 3d. is available for distribution, out of which dividends at the rate of 6 per cent. per annum have been declared on the preference, and 7 per cent. per annum (tax free) on the fully paid up ordinary shares (absorbing £35,253. 15s. 3d.), leaving £785. 18s. to be carried forward. The new line via Leeson-street was opened to Clonskea on March 12, the new line to Victoria Bridge, Ringsend-road, on May 1, and from Victoria Bridge to Sandymount on 4th inst. The through running of this line via Ringsend to Sandymount is delayed by the rebuilding of the bridge. The Southern Quay line is still closed owing to main drainage works. The new line from Capel-street to Ballybough Bridge is practically completed, but is not yet opened for traffic. The whole of the electrical construction and equipment of the old and new lines being now within measurable distance of completion, the directors consider that the best and cheapest way of raising the necessary additional capital is by increasing the borrowing powers of the company. It is estimated that £200,000 will be sufficient to pay off the company's liabilities, and to complete the works in hand, but it is deemed advisable to obtain powers to raise £300,000 to provide funds to meet future developments.

Globe Telegraph & Trust Co. (Ltd.).

The report of the directors for the year ended July 18 states that the net revenue, after deduction of expenses, amounts to £198,420. 4s. 1d. and makes, with £1,091. 2s. 9d. brought forward, £199,511. 6s. 10d. From this there has been distributed £132,321. 10s. 9d. in interim dividends, leaving £67,189. 16s. 1d. The directors recommend a final dividend for the year of 3s. per share on the preference and of 4s. 6d. per share on the ordinary shares, making a total dividend for the year of 6 per cent., less tax, upon the preference, and 5½ per cent. net upon the ordinary shares, leaving £982. 14s. 11d. to be carried forward.

During the year the Eastern Extension Telegraph Company and the Commercial Cable Company have both issued new share capital, which was offered to the shareholders of those companies *pro rata* to their holdings, the former at £13 per share and the latter at par. The full number of shares thus offered has, in each case, been taken up by the Globe Company the cost being met by the sale of other securities.

British Electric Transformer Manufacturing Co. (Ltd.).

The report of the directors for the year ended June 30 states that the business done by the company during the year has been very satisfactory. The accounts show that after paying all manufacturing costs and expenses of administration, and providing for repairs and depreciation, there remains £6,184. 8s. 9d., which, with the sum brought forward gives an available balance of £6,421. 17s. 10d. The directors recommend a dividend at the

Digitized by Google

rate of 10 per cent. per annum (one-half was paid as an interim dividend in February) and a bonus of 2½ per cent. for the half-year, absorbing £2,119. 12s. 5d. £2,500 is put to reserve, and £1,802. 5s. 5d. carried forward. The lease of the present works expires next year, and the board will erect and equip new works near London, without increasing the present capital of the company. The business continues to show steady progress. The authorised capital of the Company is £50,000, with £40,000 fully subscribed.

Edison & Swan United Electric Light Co. (Ltd.).

The seventeenth annual report for the year ended June 30 states that the profit amounted to £43,388. 1s. 5d. After providing for debenture interest, there remains £29,208. 11s. 11d. available for distribution. An interim dividend at the rate of 6 per cent. per annum having already been paid in respect of the half-year ended December, 1899, a further payment, at the rate of 6 per cent. per annum, for the second half is recommended, making the dividend for the book year 6 per cent. per annum, the balance (£6,199. 18s. 5d.) being carried forward. The issue of the £100,000 5 per cent. Second Debenture stock was duly made and fully subscribed. A quotation has been granted by the Stock Exchange. The retiring directors (Mr. J. Staats Forbes and the Earl of Lichfield) offer themselves for re-election.

ALUMINIUM CO. (LTD.)—The directors' report for the nine months ended March 31, states that the profit for the period was £19,684. 1s. 2d. After deducting debenture interest and other charges, the net profit is £13,508. 1s. 3d., which, with £5,501. 10s. 11d. from last account, makes an available balance of £19,009. 12s. 2d. A dividend at the rate of 15 per cent. per annum for the period is recommended, and the balance (£11,697. 2s. 2d.) is to be carried forward. The directors state that they have carefully considered proposals for the amalgamation of the company with the Castner-Kellner Alkali Co., the purchasers of the Castner patents for the manufacture of caustic soda and bleaching powder by electrolysis, and a provisional agreement has been entered into for the sale of all the property of the company, excepting the shares of the Castner-Kellner Company held by the Aluminium Company. If this agreement is approved the holder of each Aluminium share will receive three shares of the Castner-Kellner Company with right to participate in the dividends of the latter company from March 31 last. Mr. G. H. Clarkson, who has resigned the office of secretary, which he had held since the formation of the company, has been elected a director in place of the late Mr. H. Y. Castner.

NEW COMPANIES, STATUTORY RETURNS, &c.

ELECTROMOTION CORPORATION (LTD.)—This company was registered on July 19, with a capital of £50,000 in £1 shares, to acquire a concession for supplying electricity for light, power or other purposes, to Nova Friburgo, Rio de Janeiro, Brazil, and to carry on the business of electricians, electrical and mechanical engineers, suppliers of electricity, &c.

CITY NOTES.

MEMORANDA.—Bank rate 4 per cent. (since July 19, 1900). Price of silver 27⅞d. per oz. (July 26). Consols (2¾ per cent.) 97⅝—97⅞ for money, 97⅝—97⅞ for account; 2½ per cent. 97—97⅛ (July 26). Stock Exchange Settling Day: Consols, Aug. 2; Stocks and Shares Continuation Days, Aug. 13 and 28; Ticket Day, Aug. 14; Pay Days, July 27 and Aug. 15; Mining Share Carry-over Days, Aug. 11 and 27.

ALDERLEY AND WILMSLOW ELECTRIC SUPPLY (LTD.).—At the annual meeting, held last week, the chairman (Mr. F. E. Gripper) said the works were opened in October, 1899, and the capital expenditure had been £16,074. The number of lamps connected at that time was 438 8 c.p., and at the end of December 1,223. It was expected that by the end of 1900 3,000 lamps would be connected. The "free" wiring system had been adopted, and seemed likely to become general in the district. Penny-in-the-slot meters were supplied to the company's customers. Negotiations were proceeding with the Wilmslow Council for the supply of current for lighting that district.

BLACKHEATH & GREENWICH ELECTRIC LIGHT CO. (LTD.)—Applications have been invited during the week for an issue of £100,000 (part of an authorised issue of £120,000) 4½ per cent. first mortgage debenture stock.

BRISTOL TRAMWAYS & CARRIAGE CO. (LTD.)—The directors have declared an interim dividend to June 30 at the rate of 7½ per cent. per annum (payable August 4) against 7 per cent. for the corresponding period last year. The total receipts for the half-year were £74,991, against £72,396. The number of passengers carried was 12,061,613, against 11,403,683.

BRITISH COLUMBIA ELECTRIC RAILWAY CO. (LTD.)—At the general meeting, held on Wednesday, Mr. R. M. Horne-Payne said the company was in a prosperous condition. The net earnings, which were £33,238 for 1898-99, amounted to £40,512 for the last financial year. The growth of the business in the lighting department had been large, and the power supply department had been put into a better condition, and was being worked profitably. The proceeds of a recent issue of shares would be applied in providing a further unit of plant at Victoria, further boiler power in Vancouver, and to the purchase of additional rolling stock in both places in order to enable the company to meet the winter demand. A final dividend on the ordinary shares of 2 per cent., making 4 per cent. for the year, was approved.

BRITISH INSULATED WIRE CO. (LTD.)—The directors have declared an interim dividend at the rate of 10 per cent. per annum for the half-year ended June 30.

CHARING CROSS & STRAND ELECTRICITY SUPPLY CORPORATION (LTD.)—The directors have, after providing for debenture and other interest and dividend on preference shares, declared an interim dividend at the rate of 8½ per cent. per annum for the half-year ended June 30, and carry forward £10,508. The interim dividend for the corresponding period of 1899 was at the rate of 8 per cent. per annum, with a carry-forward of £8,300. The lamps connected during the past half-year have amounted to the equivalent of 24,242 8 c.p.

CONSOLIDATED TELEPHONE CONSTRUCTION & MANUFACTURING CO. (LTD.)—Col. G. Gouraud announces his intention of offering himself at the forthcoming meeting of shareholders for election as a member of the board. Col. Gouraud was a director of the company in the early days, representing Mr. Edison's interests.

COUNTY OF LONDON & BRUSH PROVINCIAL ELECTRIC LIGHTING CO. (LTD.)—An interim dividend on the preference shares has been declared at the rate of 6 per cent. per annum, less tax, for the half-year ended June 30, and an interim dividend on the ordinary shares for the same period at the rate of 4 per cent. per annum, less tax, both payable on Aug. 15. The company has just made an issue of £100,000 4½ per cent. debenture stock at £108. The transfer books and register of members will be closed from Aug. 6 to 15 inclusive, preparatory to the payment of an interim dividend on the preference and ordinary shares for the half-year ended June 30.

DUDLEY, STOURBRIDGE & DISTRICT ELECTRIC TRACTION CO. (LTD.)—Applications are invited until 4 p.m. this day (Friday) for a balance issue of 19,370 5 per cent. Cumulative preference shares of £5 each in this company at par. The issue is made by the Electric & General Investment Co. (Ltd.) on behalf of the British Electric Traction Co. (Ltd.), who guarantee the issue, and are themselves holders of 19,707 ordinary shares in the Dudley Company, which has a total authorised share capital of £200,000. The Dudley Company was formed in 1880, and owns tramways from Dudley to Stourbridge, 5½ miles in length, recently converted to electric traction on the overhead trolley system. In addition, the British Electric Traction Co. has agreed to transfer to the Dudley Company certain orders for new lines, which will bring the approximate length of the Dudley Company's tramways and light railways to 17 miles of the uniform gauge, 3ft. 6in., the whole to be worked by electricity, and to form a continuous service. The Dudley Company will further have running powers over the extensive system of the British Electric Traction Co. in the surrounding districts. The various tramways and light railways controlled by the Dudley Company are owned in perpetuity, subject to the rights of the local authorities to purchase the undertakings. The prospectus, which will be found set out on another page, gives further particulars of the properties and rights owned by the company, whose existing lines for the year 1899 yielded a net profit of £4,309. The adoption of electric traction has led to a large increase in the number of passengers carried and the receipts therefrom, and it is anticipated that the complete system of 17 miles will be working before the year 1901. A coloured map, showing the existing lines and their extensions, new lines, and the lines over which the company has running powers, accompanies the prospectus.

DUNDEE & DISTRICT TRAMWAY CO. (LTD.)—The company is applying to the Court of Session, Edinburgh, for sanction to alter their articles of association so as to employ electric traction on their lines.

ELECTRIC TRACTION IN AUSTRALIA.—It is announced that "a strong syndicate of financiers has been formed for the purpose of dealing with the Adelaide electric tramway concession lately obtained by Mr. W. Gentry Bingham from the Corporation of Adelaide. The necessary capital of over £1,000,000 is said to have been guaranteed."

ELMORE'S TRUST (LTD.)—A meeting of debenture holders will be held at the Cannon-street Hotel, London, E.C., on Aug. 3 to consider resolutions sanctioning and confirming a compromise of the rights of the holders of the debenture stock.

GREAT NORTHERN & CITY RAILWAY CO.—The report of the directors states that satisfactory progress has been made with the driving of the tunnels during the past half-year, and the speed of construction will soon be greatly accelerated by the erection of four additional shields, two of which will drive southward from Drayton Park, and two southward from Old-street.

LIVERPOOL OVERHEAD RAILWAY CO.—The accounts for the past half-year show an available balance of £14,202, and the directors recommend payment of a dividend at the rate of 5 per cent. per annum on the preference and 3 per cent. (against 2½ per cent. for the corresponding period last year) on the ordinary shares. The balance forward is £4,452, against £4,320.

METROPOLITAN RAILWAY CO.—In the directors' report for the half-year ended June 30 it is stated that in view of the importance to the Metropolitan and District Railway companies of adopting electricity as a motive power, a committee consisting of three members from each of the boards of the companies has been appointed to consider the question of applying electric traction to the working of the Inner Circle, and it has been agreed between the companies to invite eminent electric traction firms to submit plans and specifications, with detailed estimates and tenders for the necessary installation.

NOTTING HILL ELECTRIC LIGHTING CO. (LTD.)—An extraordinary general meeting will be held at Winchester House, London, E.C., on Aug. 1 to consider resolutions authorising the increase of the capital of the company to £200,000.

Digitized by Google

WATERLOO AND CITY RAILWAY CO.—The directors recommend a dividend on the ordinary stock at the rate of 3 per cent. per annum for the half-year to June 30.

WESTERN UNION TELEGRAPH CO.—This company have issued their report for the quarter ended June 30, 1900. The following statement, dated June 13, shows the condition of the company at the close of the quarter ended March 31, 1900:—

Surplus Jan. 1, 1900, as per last quarterly report ...		$8,430,753 61
Net revenues, quarter ended March 31, 1900		1,318,384 05
		$9,749,137 66
From which deducting for—		
Dividend of 1¼ per cent. paid April 15	$1,216,996 25	
Interest on bonded debt.....	224,120 15	
Sinking funds	9,797 00	
		1,450,913 40
Left a surplus April 1, 1900, of		$8,298,224 26
The net revenues of the quarter ending June 30, based upon nearly completed returns for April, partial returns for May, and estimating the business for June will be about		1,700,000 00
		$9,998,224 26
From which appropriating for—		
Interest on bonds		225,000 00
		$9,773,224 26
It requires for a dividend of 1¼ per cent. on capital stock issued, about		1,216,996 25
Deducting which leaves a surplus, after paying dividend, of		$8,556,228 01

In view of the preceding statements, the committee recommend that a dividend of 1¼ per cent. on the capital stock of the company be declared payable on and after the 16th inst.

STOCK EXCHANGE NOTICES.—Aug. 1 has been appointed a special settling day in the further issue of 29,437 ordinary £5 (£2. 10s. paid) shares (Nos. 80,001 to 109,437) of the *Westminster Electric Supply Corporation (Ltd.)* These securities have also been ordered to be quoted in the official list.

NOTES.

THE Lancashire Electric Power Bill has passed through the committee stage in the House of Lords, but it has suffered considerably in the process. It will be remembered that, in order to meet the objections of the local authorities in the districts affected by the bill, the promoters only sought powers to supply wholesale and with the consent of the local authority, the only compulsory powers they asked for being that of laying mains subject to certain conditions to be imposed by these authorities as to the position the cables should occupy. Notwithstanding the modesty of the demand, and although the Commons Committee, after exhaustive examination, had decided in favour of the bill, the House of Lords Committee has decreed that the important areas of Liverpool, Bootle, Manchester, Salford and Stockport shall be excluded.

THE Corporations of these towns had no need to fear competition with their own electricity undertakings, as it could not be instituted without their own consent in their own areas, and they themselves have no power to supply outside these areas; yet they opposed the bill tooth and nail, their ostensible reason being that they objected to a company having power to open the streets within the Corporation boundaries. The exclusion of these areas will therefore have the effect of sending the mains round by a more circuitous route in many cases, but it should not have any determining influence on the success or failure of the scheme. It is surprising that the town of Southport should have opposed the bill so stoutly before the House of Commons Committee, as it is in a corner of the company's area and is not likely to be traversed by mains unless the Corporation itself were to invite the company to supply; but for the same reason this district might also have been excluded from the company's area without seriously affecting the company's own operations. Perhaps the Lords Committee thought that, as electrical energy was not so cheap at Southport as at Liverpool and Manchester, it would be well to look after the town in spite of the present Corporation, and give it a chance of possibly taking advantage of the company's system in the future. But this argument should also then have been applied to Salford, where the electricity supply works have, up to the present, not presented a marked financial success. Truly, the ways of a Lords Committee are inscrutable.

THE Shannon Water and Electric Power Bill was even less fortunate than the Lancashire Bill, for the House of Lords Committee threw it out altogether. The two grounds for opposition were, firstly, that the bill was not complete, as a further bill to permit the construction of an additional weir would have to follow; and, secondly, that the scheme would interfere with or totally destroy the salmon-fishing industry on the Shannon. The first reason being merely a question of procedure is unimportant; but the second is, of course, of moment from an economic point of view. The value of the salmon fisheries was given by Mr. BALFOUR BROWNE, who represented the Limerick Fishery District Conservators, as £40,000 a year, a figure which we think should be accepted with caution, and, moreover, the statement as to the destruction of the salmon fishery was disputed by more than one piscatorial expert witness. On the other hand, it has been recognised that the remedy for the extreme poverty in the south and west of Ireland is to introduce an industrial element into a country which is now purely agricultural. In the Shannon district, which includes some of the poorest parts of Ireland, a company desires to lay down works for the cheap distribution first of 8,000 H.P., and subsequently a possible 20,000 H.P., which could be employed for industrial purposes, and would tempt large factories to the district, as has already occurred in Lombardy, at Niagara, at Rheinfelden and other places. This would benefit the poorer population directly, to whom but a small fraction of the £40,000 from the salmon fisheries seems to find its way.

Digitized by Google

The Tyneside Bill, it will be remembered, failed to secure the approbation of the House of Commons Committee, but the remaining three large power bills have now passed both the Commons and the Lords Committee. The North Metropolitan went through without opposition, an agreement having been arrived at with the opposing local authorities. In the South Wales Bill, a clause, not of vital importance, providing for compensation to two gas companies has been reinstated, it having been struck out by the Government draughtsmen and the Board of Trade after having been inserted by the Commons Committee; but the bill otherwise passed unaltered. The passage of the County of Durham Bill was recorded in our last issue; the alteration made in it by the Lords, excluding two villages from the scope of the bill except as regards wayleaves, upsets the wise recommendation of the House of Commons Committee that the power companies should have the right to supply in districts where no electrical energy was available from the local authorities. Hebburn and Felling, the two villages in question, are, however, worse off than before, for now they are obliged to allow the company's cables to pass through their district without being able to benefit by a cheap supply of electricity.

In a leading article recently (May 25, 1900) we criticised the dallying and half-hearted way in which the directors of the Metropolitan and District Railway Companies had approached the question of equipping their lines for electric traction. Their excuse for not starting work at once was that it was necessary to effect the modification in the method of working without in any way interfering with the present system, and, in fact, to construct an electric line which would enable the old permanent way, rolling stock, and signalling arrangements to be used as before. Consulting engineers and manufacturing engineers, they admitted, possessed sufficient knowledge and experience to construct an ordinary electric railway, but this task was more difficult and quite novel, and it was necessary to take special precautions and try new methods on an experimental line. The experimental line was designed by Sir John Wolfe Barry and Sir William Preece and successfully built, but the directors have again changed their policy. The idea, that the application of electric driving to their line is a novel problem which only their own consulting engineers could solve after previous experimental work, has given way to precisely the contrary opinion; for at the last meeting of the Metropolitan Railway Co. the chairman, speaking for the Board of Directors, "believed that the best and most practical knowledge of electric traction was centred in the leading electric traction firms, and what the Board proposed to do was to ask some of the most eminent firms to submit their views as to the best method or system to adopt for the working of the circle, and invite them to submit offers, with plans and specifications, for the installation." It is satisfactory that this course is to be adopted at last, but the implication in the previous sentence of Mr. Bell's speech, reported in our City Notes this week, that the leading electric traction firms were not three years ago as competent as they are now to equip the "Underground" for electric driving is manifestly unjust and unwarranted.

At the District Company's meeting yesterday Mr. J. Staats Forbes, the chairman of that company, also made a long statement as to electric traction. The trial line between High-street, Kensington, and Earl's Court is to be extended to Putney or some other outlying station in order that it might be "a fair test and not a philosophical one." Still more interesting is the definite information that a request would be sent to-day—Friday—to several firms (Mr. Forbes mentioned Westinghouse, Mather & Platt, Siemens, and "American companies") asking for their opinions and estimates with regard to an electric traction scheme.

Yorkshire College, Leeds.—The next session commences on Tuesday, Oct. 2.

Owen's College (Manchester).—The engineering drawing office and Whitworth engineering laboratory will open on October 2nd, and lectures will commence on October 3rd. Particulars can be obtained from the registrar, Mr. Sydney Chaffers.

Cable Interruptions:—	Date of Interruption.
Latakia—Cyprus	June 21, 1899
Cayenne—Pinhieros	Oct. 11, 1899
Tangier—Tarifa	Jan. 3, 1900
Ceara—Maranham	Feb. 20, 1900
Pará—Maranham	Mar. 2, 1900
Môle-St. Nicolas—Cap Haitien	Mar. 7, 1900

The Institution Meeting in Paris.—Permission has been granted for the Institution of Electrical Engineers to hold a reception in the British Royal Pavilion in the Paris Exhibition from 5 p.m. to 7 p.m. on Wednesday, August 22. Arrangements for the reception are being made accordingly.

Physical Congress at the Paris Exhibition.—We remind our readers that the International Physics Congress at the Paris Exhibition will open on Monday, August 6th, at 3:30 p.m., in the Palais des Congrès. An extract from the programme was given in our issue of June 1st. The Electrical Congress will be held from August 18th to 25th, as already announced.

Opening of the Dublin-Howth Tramway.—The new electric tramway line from Dublin to Howth was opened on Thursday last week. The system has been constructed and is worked by the Clontarf & Hill of Howth Tramroad Co., the Dublin United Tramways Co. supplying the power and only taking charge of the cars between Dublin and Dollymount, which is a section of the latter company's lines.

The Chinese Crisis.—The Great Northern Telegraph Co. is establishing cable communication between Chifu and Taku and will lay other cables in the Gulf of Pechili. A submarine line is also to be laid from Chifu to Shanghai, forming a connecting link between North China and the existing cable system, which will be very important and valuable to the European Powers and the United States.

The National Lecture Society.—We are asked to announce that with a view of increasing British trade and spreading a better knowledge of articles manufactured in this country, the National Lecture Society is arranging a series of illustrated addresses on British industries, to be given in all important commercial centres throughout the world. Those who are desirous of availing themselves of this movement are invited to write to the honorary secretary, Mr. Leslie Stewart, Imperial Institute, London, S.W.

The Hughes Medal of the Royal Society.—It will be remembered that the late Prof. D. E. Hughes bequeathed the sum of £4,000 to the Royal Society, as well as similar amounts to the Institution of Electrical Engineers and the Académie des Sciences. The Royal Society has decided to devote this legacy to the institution of a gold medal to bear the bust of Prof. Hughes, and to be awarded annually for original work in electricity and magnetism, or their applications. Discoveries

Digitized by Google

to qualify for the medal must have been published not less than one year before the award of the medal. There is no restriction as to the sex or nationality of the candidates.

New Atlantic Cables.—The Commercial Cable Co.'s new cable from the Azores to New York *viâ* Nova Scotia has now been completed by Messrs. Siemens Bros. & Co. This line, which forms the Commercial Co's. fourth Atlantic cable, connects at Fayal with the system of the Europe and Azores Telegraph Co., and was opened for traffic on Wednesday last. Messages between North America and Germany will be carried by the German Atlantic Telegraph Co.'s cable from the Azores to Borkum.——The Telegraph Construction and Maintenance Co.'s steamer "Anglia" left for New York on Thursday last week to commence laying the remaining part of the German Atlantic Telegraph Co.'s cable from New York to Fayal.

Fire at the Lachine Rapids Works.—A serious fire occurred on June 24 at the sub-station of the Lachine Rapids Co., at Montreal. The fire, the precise cause of which was unknown, started on the low-pressure switchboard and spread to the 4,000-volt board, and immediately after the whole building was ablaze. The damage would have been more serious still had it not been for the presence of mind of the general superintendent, Mr. R. S. Kelsch, who rushed through the flames to the private telephone on an upper floor, in order to instruct the power house to switch off the current. The night watchman unfortunately was killed. Twenty hours after the accident the company succeeded in resuming the supply to all their customers.

Competition for the Invention of Insulating Gloves.—A prize of 1,000f. (£40) is being offered by the Association des Industriels de France contre les Accidents du Travail, 3, Rue de Lutèce, Paris, for the most efficacious insulating gloves for electrical workmen. They should be strong enough to resist not only the electric pressure, but also accidental perforations by copper wires, &c., and must, in addition, be easy to wear by hands of any size and allow the workmen's fingers sufficient freedom to execute their work. The competition is international, and competitors must send two pairs of gloves, accompanied by an explanatory note to the President of the Association before Dec. 31, 1900. The Association reserves to itself the right to publish descriptions of samples submitted to it, and inventors should therefore take the precaution of protecting their invention previously.

Thunderstorms.—A good deal of damage was caused by last Friday's thunderstorms in several parts of the country. The Post Office telegraphs and telephone testing station at Weedon, through which a large number of main-line wires from Ireland, Scotland, and England pass, was only saved from partial destruction by the arrival of 100 soldiers from the barracks with a fire engine. The communications were complete again by daybreak on Saturday, although to accomplish this the wires had to be joined up without running them through the testing station. In Berkshire, the Isle of Wight, Kilkenny, and Worcestershire men and animals were killed by lightning, whilst at Bulford Camp one volunteer was killed and a dozen or more injured. At Kingston-on-Thames the post office was struck, although without interrupting the telegraphic service, and in all parts of the country serious damage to property was done.

Central London Railway.—The Central London Railway was opened to the public on Monday last, and both from a technical and financial point of view the line promises to be eminently successful. Crowds of people made use of the new line all day, and general satisfaction is expressed with it by the travelling public. The run from the Bank station to Shepherd's Bush takes only 25 minutes, and the trains follow at five-minute intervals, stopping 30 seconds at each station. A slight hitch occurred for an hour at about seven o'clock in the evening owing to the brake of one of the 12 trains in use getting out of order as it was entering Tottenham Court-road station from the City side. The railway carried 85,400 passengers on Monday, and 90,000 on Tuesday. —— On Friday last a large number of the members of the Institution of Junior Engineers availed themselves of the opportunity afforded by Mr. Basil Mott for visiting the generating station and the line.

The Patent Office Library.—The Patent Office is issuing convenient "subject lists" as a guide to those who have occasion to use the Patent Office library. Each volume contains a general alphabetical list of subject-headings with descriptive entries in chronological order of the books arranged under these headings. In this way the operation of picking out works referring to any particular subject or part of a subject will be greatly facilitated. In preparing the lists, the contents of the work have been considered in preference to the language of the title page, which is often misleading. Searchers who desire to find a particular book by a given writer or with a given title can always find it by consulting the general library catalogue. The first volume of this series, including only "photography and the allied arts and sciences," has just been published, and its price is 6d. We trust that the volumes relating to electrical subjects will soon follow, for such a reference catalogue will prove most useful.

An Amusing Dispute.—The town of Dudley was entertained on Saturday and Sunday last by an amusing dispute between the Corporation and the British Electric Traction Co., with regard to the laying of feeder cable for the Dudley and Sedgeley tramway. It appears that the company decided to lay cable on the "draw-in" system, while the Corporation desired that they should employ the "solid" system, similar to that used on the Corporation lighting network. The Corporation maintain that in their agreement with the company the latter undertook to lay the cables to the Corporation's satisfaction, whereas the company say that the Corporation has only the right to indicate in which part of the roadway the cables are to be laid. This difference led to a passage of arms in the streets, which is graphically described as follows in the *Birmingham Daily Post*:—

> The laying of the cables within the borough commenced during the latter part of the past week, and on Thursday, the 26th, the Tramway committee of the Town Council received an intimation from the company of their intention of using the cast-iron pipes throughout, and, if necessary, of using force to carry out the work in that way. An offer by the Corporation to lend the company earthenware troughs for the purpose of doing the work according to the "solid" system was rejected; and in spite of the representations and protestations made by the representatives of the Corporation to the officials of the company the laying of the cable in cast-iron pipes was expeditiously proceeded with, the work on Saturday morning being completed for a distance of over half a mile. Finding that their wishes had been set at defiance, the Tramway committee resolved to take action, and sent a posse of police with a view of stopping the work, but the tramway officials and their men refused to desist. The Corporation officials, not to be beaten, were promptly on the scene with a staff of about 30 men, and for the ensuing four or five hours the extraordinary spectacle was presented of the company's men busily making excavations and the Corporation's employés as actively filling them up again. The futility of such proceedings was at last realised, and at about six o'clock in the evening a truce was declared between the rival workmen. Fearing a display of hostility, a detachment of police remained along the route of the cable throughout the night. At six o'clock on Sunday morning, on the company's men arriving to resume work, they found that the Corporation's traction engine had been placed across the road at the spot where the junction of the cable with the Stourbridge system had to be made. This formidable obstacle, however, failed to deter the persistent tramway men, who commenced to excavate underneath the traction engine, and it was stated that an effort was made to eject the men from the trench, one of whom had his clothes badly torn in the scuffle. Again a staff of the Corporation men were despatched to the spot to prevent the work proceeding. The company's officials, finding that the excavations made by their men were being filled up as fast as they were dug, hired about a dozen carts, and with these removed the refuse as it was thrown out of the trenches. The Corporation men, however, were equally determined not to be foiled, and promptly filled up the excavations with ashes and rubbish, and for a time the tramway employés were completely baffled. After this sort of thing had been going on for some time the company's men executed a counter move by surrounding the trenches with the carts, and in this way succeeded, despite the efforts of the rival workmen, in laying over 50 yards with pipes. Thousands of people flocked to the Wellington-road on Sunday morning to witness the proceedings, and the efforts of the rival workmen to frustrate each other were a continual source of amusement, the unsuccessful endeavours of either section occasioning outbursts of laughter. Eventually the company's foreman received instructions from head-quarters to suspend operations for the day.

It was stated that the Corporation would make an application in the Court of Chancery for an injunction against the company to prevent them from continuing their work, but on inquiry at the company's offices we hear that no notice of such an injunction has yet been given. The company are, in the meantime, continuing the work which, besides the laying of mains, includes the altering of the gauge from standard to 3ft. 6in.

SOUTHPORT COMBINED LIGHTING AND TRACTION SYSTEM.

(*Concluded from page 512.*)

One only of the three continuous-current sets has been put down up to the present. They are Peebles dynamos, driven by Belliss engines (Fig. 6). The engines are the ordinary Belliss E.C. 12 size, rated at 375 B.H.P., with a steam pressure of 130lb. per square inch at the stop valve, with 100deg. of superheat, and running at 350 revs. per min. When running condensing, as at Southport, the steam consumption per kilowatt is guaranteed at 28lbs. The 200kw. compound-wound dynamo, generating current at a pressure of from 500 volts to 550 volts, is four-polar, with a drum armature and carbon brushes. Besides its compactness its chief feature is the pole pieces shown clearly in the sketch, Fig. 6. As is seen, the leading horn has a small cast steel projection bolted to it with the object of securing complete sparklessness of the brushes. The armatures are slot wound and fitted to spiders of rigid design and thoroughly ventilated. The efficiency of the combined set is stated to be 89 per cent. at full load. We are informed that Peebles dynamos have also been ordered for traction purposes at Aberdeen, Barrow-in-Furness, Carlisle, Dewsbury, Erith, Perth and Warrington.

The tramway switchboard, shown in Fig. 7, owing to exigencies of space, had to be built in an angle of the building, and this has proved a most convenient arrangement. Messrs. Dorman & Smith have supplied this part of the plant. It is built up of polished slate panels mounted on a skeleton frame of T-iron. On the right are three generator panels, each with an ammeter, a voltmeter, the hand wheel of the shunt rheostat, and three double-break switches—equaliser, + and − respectively. The next two panels are for the insulated rail feeders, both of which come from the same point of the tramway system. On these panels are four ammeters (two of which are spare), two voltmeters with plugs for connecting them to any circuit, and two recording wattmeters, one for the energy leaving the 'bus bars, the other to record the energy used for lighting the works. The two centre panels are for the Board of Trade instruments, with the exception of the upper half of the left-hand of the two, which it is seen has two smaller switches and an ammeter, and controls the works lighting circuits. The Board of Trade panels are at present being altered, as according to their present arrangement allowance has not been made for the rail feeders. On the right are the four circuit panels, each fitted with an ammeter, a Wurtz lightning arrester (with its choking coil behind) a circuit-breaker, a two-way switch (allowance being made for the possible employment of boosters subsequently, when the top contacts will include the booster in the circuit and the bottom contacts will connect the dynamo straight to the 'bus bars) and a Thomson recording wattmeter. Messrs. Dorman & Smith's circuit-breakers are

of a particularly neat design, shown in Fig. 8 in front and side elevation, the right-hand drawing showing a side elevation of the right-hand part of the device only. A tongue holds the laminated brush in position in its contacts against the force of a spring so long as the handle on the right is in its upright position and its roller is pressing against the intermediate brass piece. The main current, however, passes through the bare copper coil on the extreme right at the lower corner, and when this gets too strong it attracts the small piece of iron over it and pulls over the lever to its unstable position, from which it falls, allowing the other two parts also to fall back and break contact. The *modus operandi* is difficult to describe, but

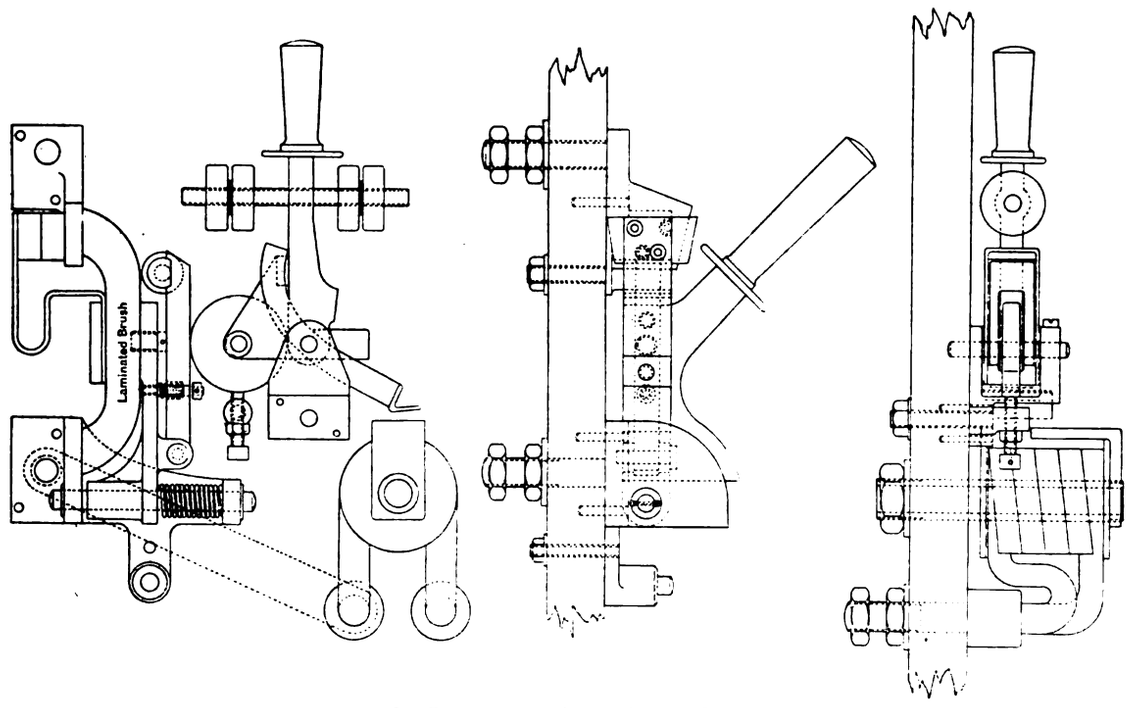

FIG. 8.—DORMAN AND SMITH CIRCUIT-BREAKER.

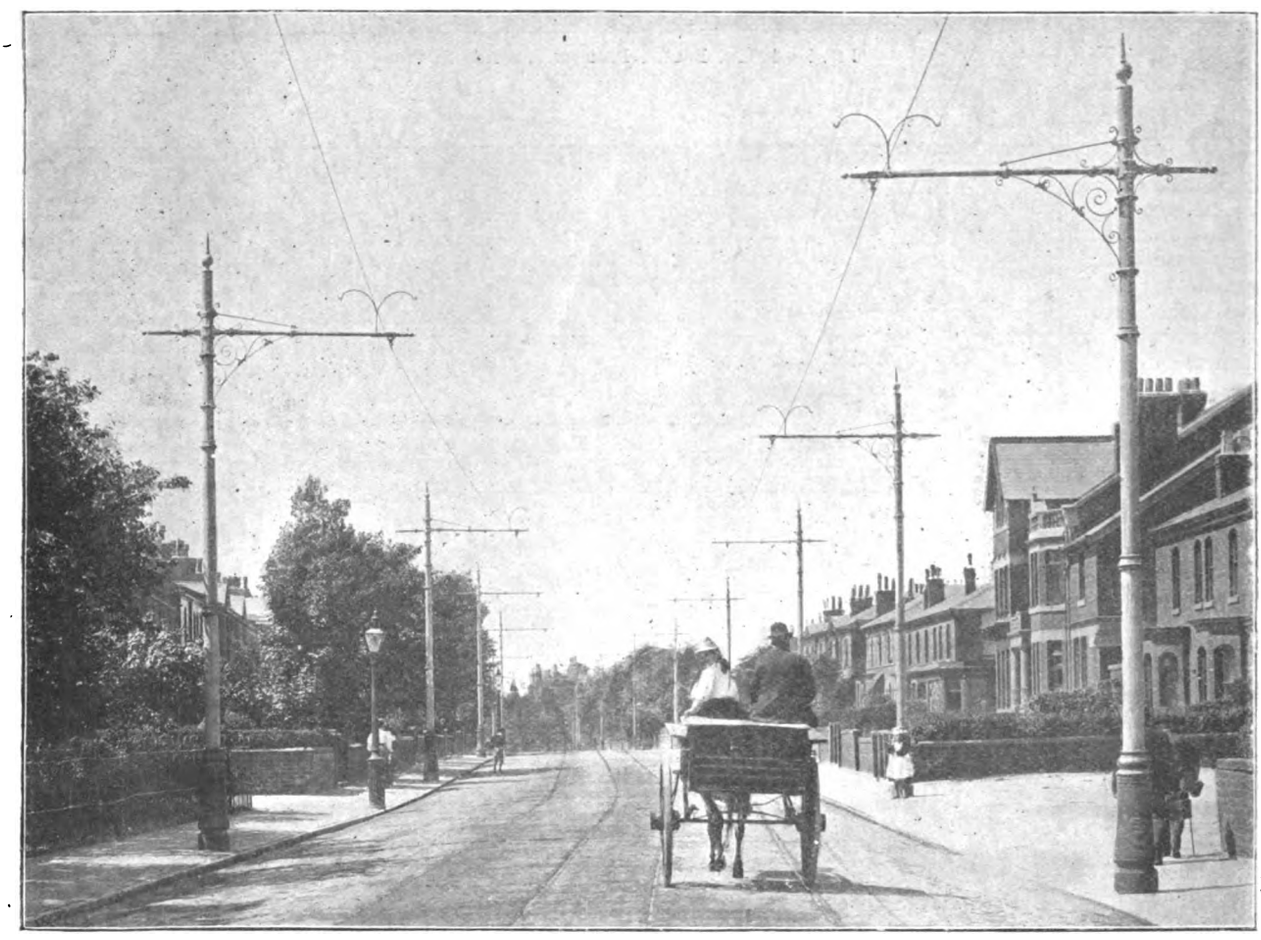

FIG. 9.—DOUBLE POLE LINE IN MANCHESTER ROAD.

can be made out from the drawing. The dial voltmeters and ammeters are of the Weston make, and the recording ammeters of Messrs. Elliott Bros. standard pattern.

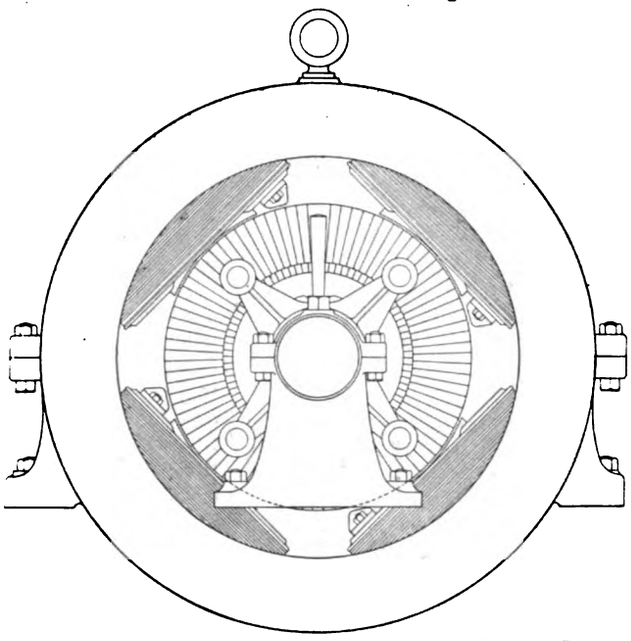

FIG. 10.—SKETCH SHOWING SHAPE OF POLE-PIECES OF PEEBLES DYNAMO.

A large extension is being built to the engine room, big enough to contain plant for a light, power and traction system of greater dimensions than that ever likely to be attained at Southport. No doubt this extension may have something to do with the violent antipathy that some of the members of the Corporation have to the power bills, one of which was described in a speech of the chairman of the Tramways committee, on the opening day, as "that abominable bill"—any mention of the name or scope of the bill being deemed redundant. The existing engine room measures 120ft. by 60ft. by 18ft. high; and the new one, of which the walls and roof are already finished, is 20ft. wider and considerably higher, its dimensions being 94ft. by 80ft. by 25ft. high, the heights in the two cases being given as the distance between the under side of the traveller and the floor.

The boiler house has been extended a corresponding amount. Six boilers are in use at present, all of the Lancashire type, with the dimensions 28ft. by 7ft., and by various makers. They are hand-fired. In the new boiler house, Messrs. Musgrave & Sons are putting in three Lancashire boilers, 30ft. by 8ft. 6in., rated at 600 H.P. in aggregate, all fitted with Musgrave superheaters to give 120deg. of superheat. A 360-tube economiser, by Roberts Bros., is also to be added, the existing 288-tube one of the same make, having given satisfaction. The scrapers are driven by a Langdon-Davies motor. A railway siding has been put down next to the boiler houses, so that the coal can be discharged directly from the trucks into the coal bunkers, the boiler room floor being below ground level and the tops of the boilers on a level with the engine room floor. The original ring steam main has given place to a single range of pipes.

As already mentioned, the vertical Musgrave engine has its own jet condensers. In addition, there are Körting and Browett-Lindley condensers for the other sets. There is a large cooling pond in front behind the works and water is pumped from a brook in the vicinity.

Near to the generating station a spacious car shed is being built. The building will be of brick with timber ends, and will contain three bays, one of which will be walled off for a repairing shop. A whole army of workmen is employed in order to get the building ready, as at present the cars have no roof under which to shelter their weary motors and their chocolate and cream flanks. In fact, as is unfortunately frequently the case, it would have been well to have delayed the opening day a little, as several alterations were necessary in the overhead equipment, and it is also scarcely wise to run a line from a single generating set, the dynamo of which bore evidences of being erected in a hurry, while the reserve set is still in its packing cases. During the excavation for the foundations of the car shed a large quantity of peat has been dug up. It is not proposed to burn this as fuel in the boilers, although a German chemist is reported to have calculated recently that one acre of good peat turf 10ft. thick gives 1,000 tons of dry turf, equivalent to 480 tons of coke!

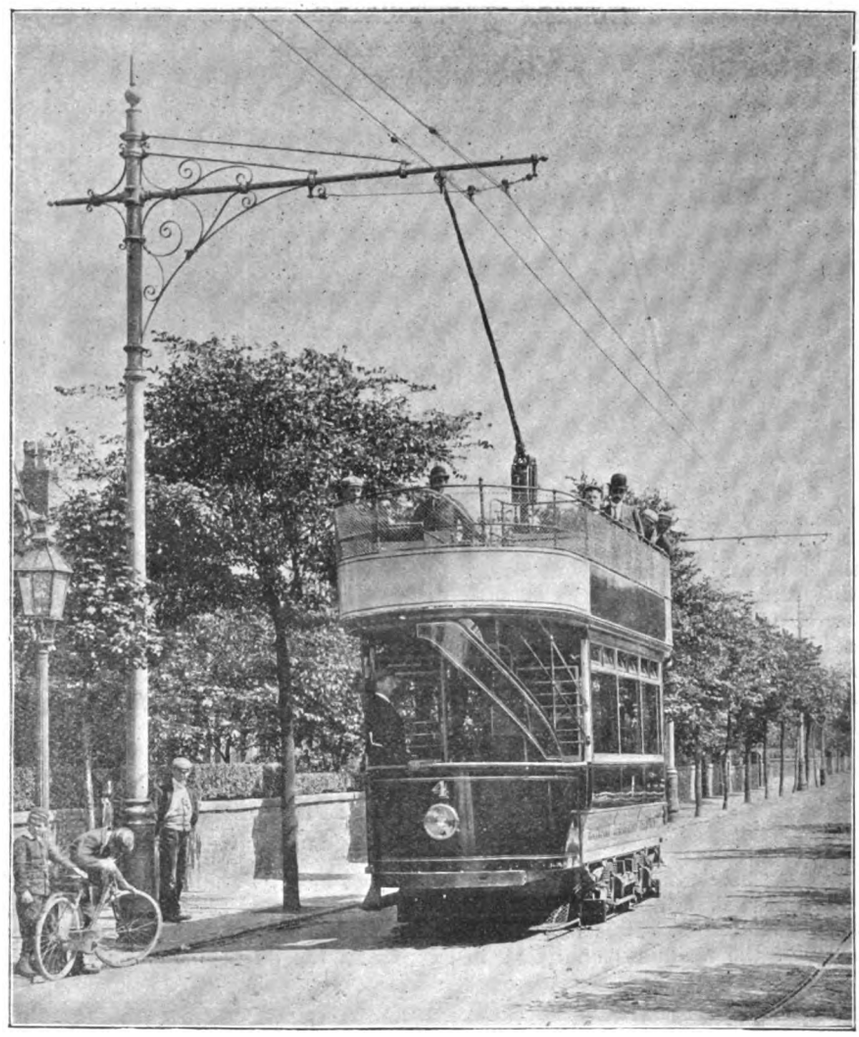

FIG. 11.—SINGLE BRACKET POLE WITH TWO LINES IN SUSSEX ROAD.

Fig. 5 is a map, drawn to scale, showing the extent of the lines now open, the position of the power-house, and the lines about to be equipped electrically. The position of the feeders and rail returns is also shown. At present there is only one feeder of 0·4 sq. in. section, but three more are to be laid. The two insulated rail feeders each of 0·75 sq. in. section for the centre of the system, will suffice for all the routes when completed. In addition, there are pilot wires measuring the fall of potential on the rails, and also wires for telephones, which will be placed in the section boxes. The feeders are laid on the Callender solid system in ∪-shaped stoneware troughs. The lengths of stoneware troughs have sockets, and, as the

Digitized by Google

cross-section is larger than a semi-circle, the pipe-line is locked, and adjacent lengths of pipe cannot sink unevenly. After the cables have been drawn in, and the pipe filled with compound, the duct is covered with a stoneware brick. Compound is also used to fill the space in the sockets.

Single-bracket poles (Fig. 11) holding the two wires are chiefly employed in the overhead construction, but in one instance (Fig. 9) a double line of poles is employed, one line on each side of the road. The poles are of an elegant design, and even where there are guard wires, as seen in Fig. 9, they are not unsightly. Some details in the attachment of the guard wires and anchor wires are open to criticism, as, for instance, making-off the anchor wires on the trolley wire ears and the omission to secure the guard wires (which are also noticeably kinked in places) to the hooks. The latter is a serious defect, for in the case of a guard-wire breaking several hundred yards of it might come down. A method of flexible attachment adopted on one of the routes is shown in Fig. 11. The trolley wires are of 00 B. & S. gauge (0·364in. diameter), two wires are used throughout for the cars in the two directions, and the line is divided approximately into half-mile sections. At the feeding points vulcanised indiarubber wire is employed from the section boxes to the trolley line. Messrs. Macartney, McElroy & Co. were the contractors for the overhead equipment.

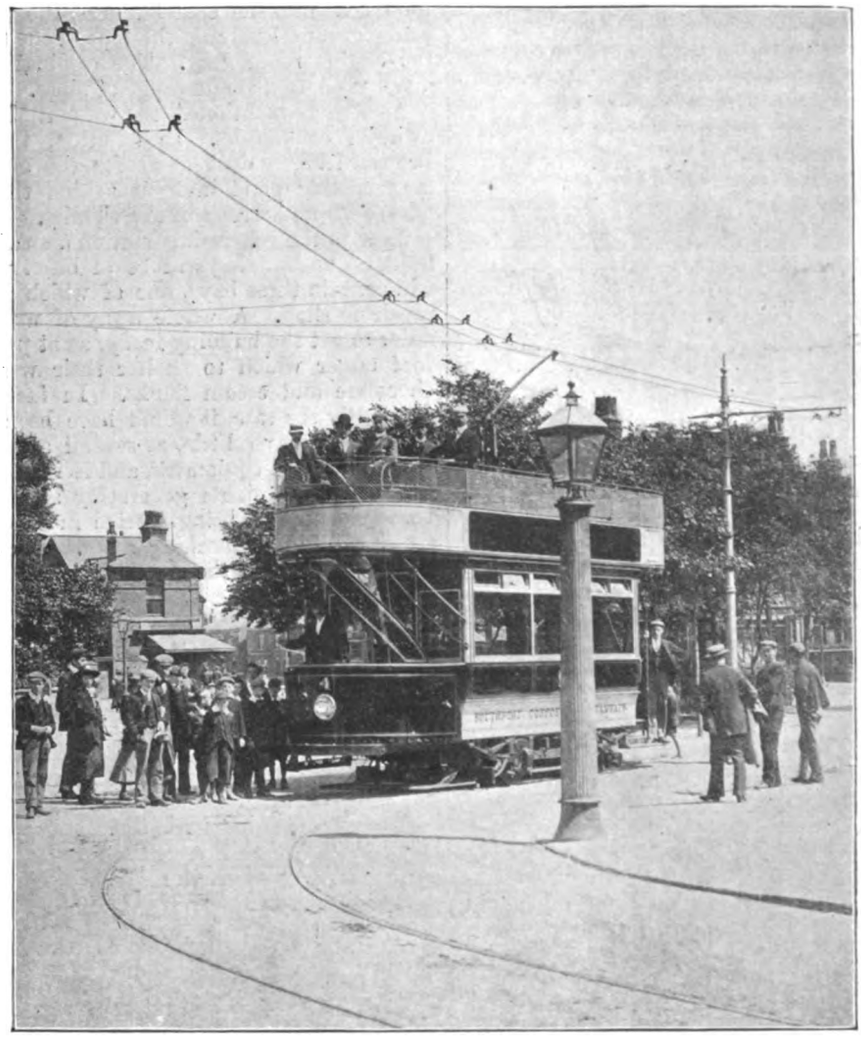

Fig. 12.—A Sharp Curve.

The contractors for the rails and permanent way were Messrs. Dick, Kerr & Co., and some 800 tons of steel girder rails of their No. 75 section have been employed. These rails weigh 87lb. to the yard, are made up in 40ft. lengths, and are jointed with the firm's "Dicker" joint and 0000 "Neptune" bonds. Cross-bonding is done every 120ft. The gauge is standard, 4ft. 8½in. The points and crossings were supplied by Messrs. Askham Bros. & Wilson. The points are 7ft. 6in. long and 6½in. deep.

The rolling stock for the present consists of nine double-decked cars, but there are also six single-decked cars on order, Messrs. Dick, Kerr & Co. supplying both types to the Corporation. The cars now running have been manufactured at the Electric Railway and Tramway Carriage Works at Preston, and, as seen in the illustrations, are of the reversed stairway type which, while affording complete protection to the passengers from the danger of falling when ascending and descending the stairways, also allows an increased seating capacity of something like 12 per cent. The cars are of handsome appearance. They are mounted on Brill 21 E. single trucks and are lighted electrically, having eight lamps in the interior and also headlights and platform lamps. The electrical equipments were designed by Prof. Short, and are of the same type as those supplied by the contractors to Liverpool, Bolton, Dover, Sunderland, and other corporations. The American motors are, however, only to be left on the cars temporarily, and will soon be replaced by motors of a new design of Prof. Short's, which will be manufactured at the new works of the English Manufacturing Co., recently described in *The Electrician*. Two 25 H.P. motors are fitted to each car and the controllers are of the solenoid blow-out pattern. Each car carries 22 passengers inside and 34 outside. The six single-deck cars on order are combination open and enclosed cars seating 16 passengers inside and 16 outside. As there are no grades of any importance on the routes, ordinary hand ratchet brakes have been fitted with a short-circuiting brake for emergencies.

THE PARIS EXHIBITION.—III.*

(BY OUR SPECIAL CORRESPONDENT.)

The 1,500kw. Willans-Siemens set desersves first mention among the three English machines generating current for the light and power supply of the exhibition. It is one of the largest, in point of capacity, of the machines exhibited in operation by any of the countries represented, yet in point of actual physical dimensions, especially as regards the floor space it occupies, it is almost one of the smallest. The engine (Fig. 8) is the largest Messrs. Willans & Robinson have yet built; but, in spite of its large size, a fast speed has been adopted (200 revs. per min.), and it has therefore been possible to retain the single-acting principle and to construct the engines with but little modification from the lines usually adopted by the firm, and admirably described in Mr. Mark Robinson's Paper read before the Institution of Electrical Engineers in 1895.† Briefly, therefore, the engine

* Preceding articles appeared in *The Electrician* of July 20 and 27.

† See *The Electrician*, Vol. XXXV., pp. 152, 93 and 117.

Digitized by Google

is a central-valve, triple expansion, three-crank engine, and the following are the chief dimensions, &c.:—

Cylinder diameters: 49in. (1,250mm.), 30 1/8in. (770mm), and 18 7/8in. (480mm.).	
Stroke	23 5/8in. (600mm.).
Maximum power for continuous running:	2,400 H.P.
Ditto short periods	3,000 H.P.
Speed	200 revs. per min.
Weight	120 tons.
Floor space occupied	31ft. by 11ft. 1in.
Steam pressure	10 atmospheres.
Worthington jet condenser.	

Among the modifications necessitated by the larger size is that the bed-plate is divided longitudinally into two parts, down the centre-line of the crank shaft, and is bolted together to form the usual oil bath. Each piece weighs about 15 tons. The crank chamber upper-part is also divided; and the lower portion is in four pieces, so as to enable the crank shaft, connecting rods and crossheads to be withdrawn if necessary, without dismantling the engine. The exhaust chamber is in one piece. The governor is of Messrs. Willans' usual centrifugal pattern, but it is placed vertically, and driven by screw gearing on the crank shaft, in accordance with the practice the firm adopted in all its larger engines. The crank shaft, in spite of its size, is in one piece, with the eccentric forged upon the crank pins as usual. The diameter of the journal is 14·5in. (368mm.), and the total weight of the shaft is about 12 tons. Contrary to the practice of several of the German firms, which have adopted heavy flywheels in addition to heavy flywheel armatures, the armature of the dynamo is considered sufficient in this respect, and a coupling disc only is supplied upon the engine. The coupling disc serves also for the purpose of barring. The firm has two other machines of the same size on order for the Glasgow Corporation.

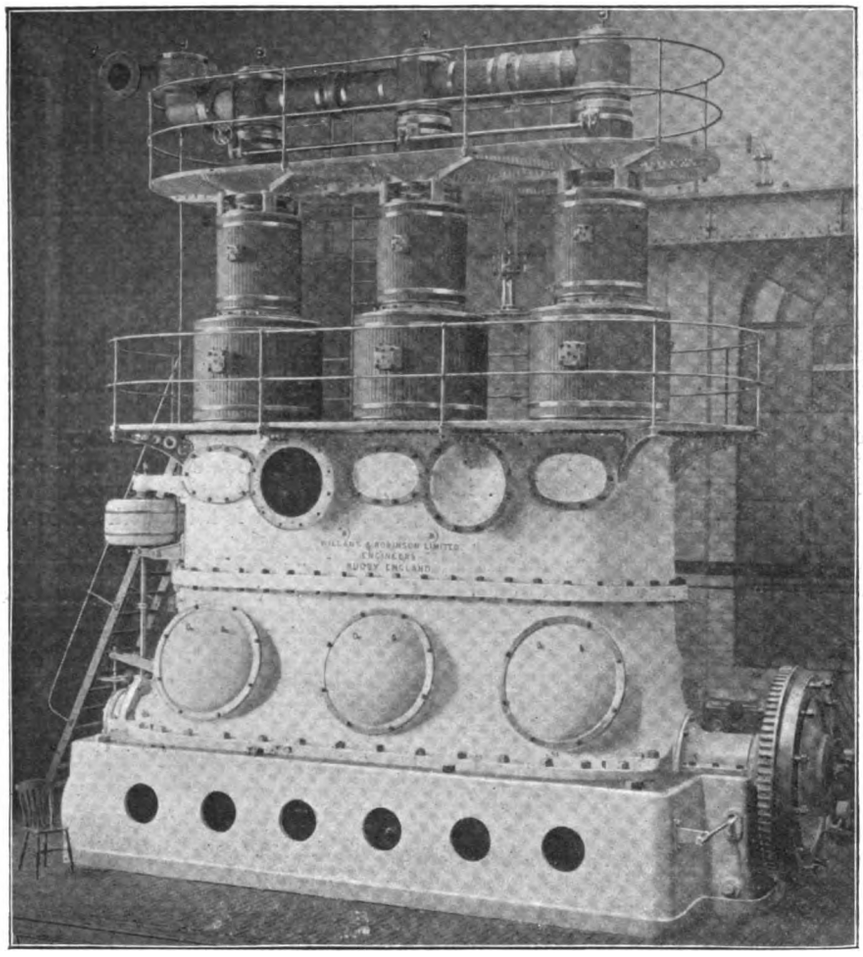

FIG. 8.—2,400 H.P. WILLANS ENGINE.

In the generator (Fig. 9) the field magnets consist of a circular ring of cast steel, 14ft. outside diameter, made in two halves which are bolted together. There are 16 inwardly projecting poles (forming part of the ring casting), each of which carries a bobbin wound with copper wire. The armature is of the usual slotted type, built up of a number of toothed segments of sheet iron supported by a cast steel spider, and bolted together by end castings. It is provided with ventilating ducts. Each slot contains four insulated solid copper bars, which are connected so as to form a multiple circuit singly-wound drum winding. The end connections are of the barrel type.

The commutator is 66in. in diameter, and has 616 segments of hard copper insulated by mica. It is so arranged as to permit of removal of sections without pulling the whole commutator apart, and is long enough to allow of axial adjustment of the brushes to equalise the wear. There are 19 carbon brushes to each spindle, carried by aluminium holders, and pressed against the commutator by means of steel springs. Flexible copper strips connect the brush holders with the gun-metal bar to which the cable connections are made. The brush arms are fixed by insulated bolts to horizontal projections from the cast-iron ring which can be rotated for adjustment of the brushes in the usual manner.

The sole-plate of the dynamo carries an outer bearing of ample proportions; it is provided with a stair and rails for inspection and for attending to the lubrication. The weight of the dynamo complete with sole-plate and bearing is 60 tons; of the armature including commutator and spindle, 29 tons.

The switchboard presents no special features except that the minimum cut-out and the switch are of extremely massive construction, in view of the large current that has to be carried. The fixed contacts of the minimum cut-out are made up of copper gauze brushes so arranged that the pressure of contact can be adjusted, and the single-pole main knife switch has a heavy laminated J-shaped contact-piece attached to the switch arm, and this breaks the circuit in four places, the switch being designed for a maximum current of 3,500 amperes.

Next to the Willans-Siemens set is another typical English steam dynamo—a Mather & Platt generator driven by a Galloways' vertical compound engine. The dynamo is shunt wound, and has an output of 220 to 250 volts and 1,400 amperes, at 105 revs. per min.; it is, however, capable of carrying a temporary overload up to 1,600 amperes. It is of the 12-pole type, the yoke ring and magnet cores being of cast steel, and arrangements are made so that the lower half of the ring can be lowered into the foundations, enabling any magnet winding to be taken off or to be easily inspected. The armature is central hung (as seen in Fig. 11), being mounted upon the crank shaft between the two engine bearings, so that the dynamo has no bearings of its own. This construction has recently been adopted by Messrs. Mather & Platt in their larger machines, *e.g.*, in those recently described in connection with the Bolton tramways. The armature is not keyed to the shaft but bolted directly to the heavy flywheel with which the engine is provided. The armature is of the slotted type, the bars being laid in insulating troughs, and entirely embedded in the iron of the core, and the commutator is of large diameter and width. The brush holders for the carbon brushes are fitted with a practical

Digitized by Google

"hold-off" attachment, enabling a carbon to be replaced during running simply by lifting off the brush and without disturbing the adjustment of the pressure with which it bears on the commutator.

The efficiency of the generator is stated by the makers to be 94 per cent., which, with a stated engine efficiency of 91 per cent. gives a combined efficiency of 85·5 per cent.

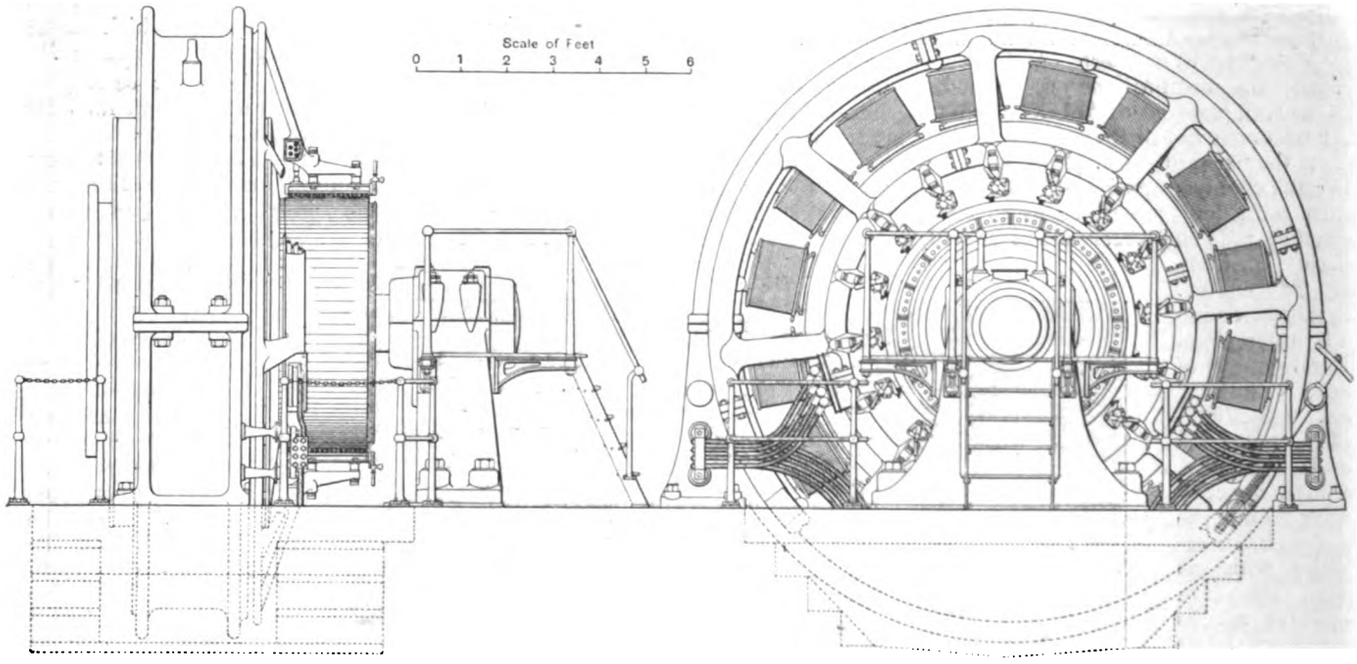

FIG. 9.—SIEMENS BROS. & CO.'S 1,500KW. MULTIPOLAR CONTINUOUS-CURRENT DYNAMO. (2,730 amperes at 550 volts; 200 revs. per min.)

The engine is capable of developing up to 680 I.H.P. when provided with steam at 10kg. per sq. cm. and running at 105 revs. per min. The high-pressure cylinder is 18in. in diameter, and the low-pressure 34in., both being arranged for a stroke of 3ft.; the cylinders are erected on standards of an enclosed type, the flywheel and dynamo being mounted between them as already explained. The distribution of steam to both high and low-pressure cylinders is effected by Corliss valves, having separate chests for steam and exhaust, both sets of valves deriving their motion from eccentrics fitted on the crank-shaft, driven from the end of the main crank pins. The steam is superheated between the high and low-pressure cylinders. The whole of the valve gear is arranged on the outer sides of the standards, and thus, owing to its accessibility, admits of ready adjustment at any time from the outside of the engine, and further, in conjunction with the enclosed design of the standards, avoids the risk of any oil, steam, or water being splashed upon the dynamo. The governor, which is of the high-speed, centre-weight type, is positively driven from the valve shaft, and acts on the high-pressure cylinder; provision is also made for the adjustment of speed by hand while the engine is running. A system of forced lubrication is adopted. The condenser is of the ejector type and is fitted with an independently-driven water pump.

Two other machines in the British section which, on account of their compactness, have attracted considerable attention from foreign engineers, are the Parsons steam turbines and dynamos. They are shown revolving at their full speed, but not under load, as they do not supply current for the service of the exhibition. The design of these machines is more or less familiar to British engineers, however, and need not be recapitulated here. Fig. 10 shows the larger of the two,

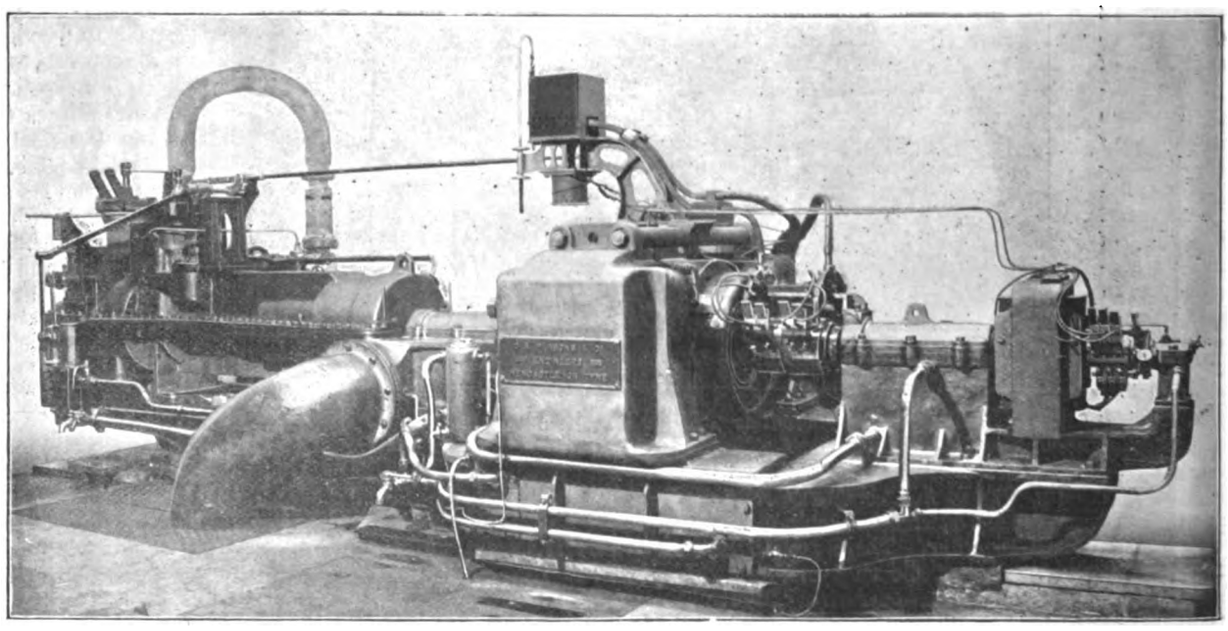

FIG. 10.—500KW. PARSONS TURBO-ALTERNATOR.

Digitized by Google

a 500kw. alternator. The armature is directly coupled to the turbine shaft, its speed being 2,400, and, the magnets being four-polar, the periodicity is 80 ~ per sec. The voltage is 2,400. The exciter is also coupled directly to the main armature shaft. Two governors are provided, an electric one for constant voltage and a mechanical one for constant speed. The turbine runs condensing, and works with a boiler pressure of 130lb. per square inch. Its bearings are lubricated by oil delivered under a pressure of about 5lb. per sq. in. from a small pump driven off the turbine shaft. The steam consumption at full load of this set is said to be about 23·5lb. per kilowatt hour, and at half load 25·5lb., and the nominal load may be exceeded by 20 per cent. The set occupies a floor space of only 25ft. by 6ft. 4in., and its complete weight is only 18 tons.

The smaller Parsons machine is a 50kw. continuous-current one which makes use of its condenser as a bed-plate, a combination only possible with a turbine where there is a complete absence of reciprocating motion and vibration. This machine also drives its own air and circulating pumps from the main shaft by means of a worm and worm wheel. The steam consumption of this plant is stated to be 38lb. per kilowatt hour, including the power required to drive the pump. The speed is 3,500 revs. per min., and the boiler pressure is 120lb.

The third English set generating current for the light and power service of the exhibition is a Robey-Ernest Scott & Mountain combination. Its engine is a cross-compound condensing engine with tripvalve gear, the dynamo and flywheel being placed between the cylinders. Its chief dimensions are:—

Diameter of high-pressure cylinder	1ft. 8in.
Do. low-pressure do.	2ft. 11in.
Stroke	3ft. 6in.
Revs. per min.	90
Diameter of piston rod	3¾in.
Diameter of middle of crank shaft	1ft. 6in.
Diameter of engine bearing	1ft. 0in.
Length do. do.	2ft. 0in.
Distance between centres of connecting rods	9ft. 0in.
Diameter of flywheel	13ft. 0in.
Width do.	2ft. 0in

Both cylinders are jacketed. The valve seatings are of phosphor bronze. The governor is of the ball type, acting on the cut-off of the high-pressure cylinder. The valves are lifted and released by levers with a pawl attachment, the levers being driven by eccentrics, and the time the levers are in contact is varied by the governor in the usual manner. In addition, there is an electrical governor, consisting of a pair of solenoids, the plungers of which act on the cut-off in the same way as the mechanical regulator. The shunt solenoid varies the cut-off to keep the voltage constant, and the series solenoid is so arranged that should the current fail from any cause the admission valve is not opened, and in consequence steam is cut off from the engine. The power required for this governor is stated to be only 150 watts. A vertical jet condenser is employed, placed beneath the floor, and worked by a rocking lever from the low-pressure piston rod.

As already stated, the dynamo is direct-driven. It is 8-polar and drum-wound, its capacity being 1,440 amperes at 280 volts. Its main casting and pole pieces are of cast steel and the armature is tunnel-wound, and it does not present any extraordinary features or evidences of exceptional "finish."

Among the other engines and dynamos exhibited in the British section are some by Messrs. Ruston, Proctor & Co. and Messrs. Marshall, Sons & Co., both of these firms, however, having their more important exhibits in the agricultural machinery section. The former firm show a vertical compound engine driving a 80 kw. dynamo directly at 400 revs. per min., the most noticeable feature of the combination being, perhaps, that the engine is enclosed and single-acting; and also another vertical compound engine 9in. × 15½in. × 10in. stroke and simple single-cylinder Corliss engine and an oil engine. Messrs. Marshall's exhibit in this section is a coupled compound, non-condensing engine designed for steam at 150lb. pressure and a piston speed of 600ft. per min. The valves are double-beat drop valves actuated by the familiar "two-valve" releasing gear fitted by this firm, and the bed of the engine is of the Corliss pattern.

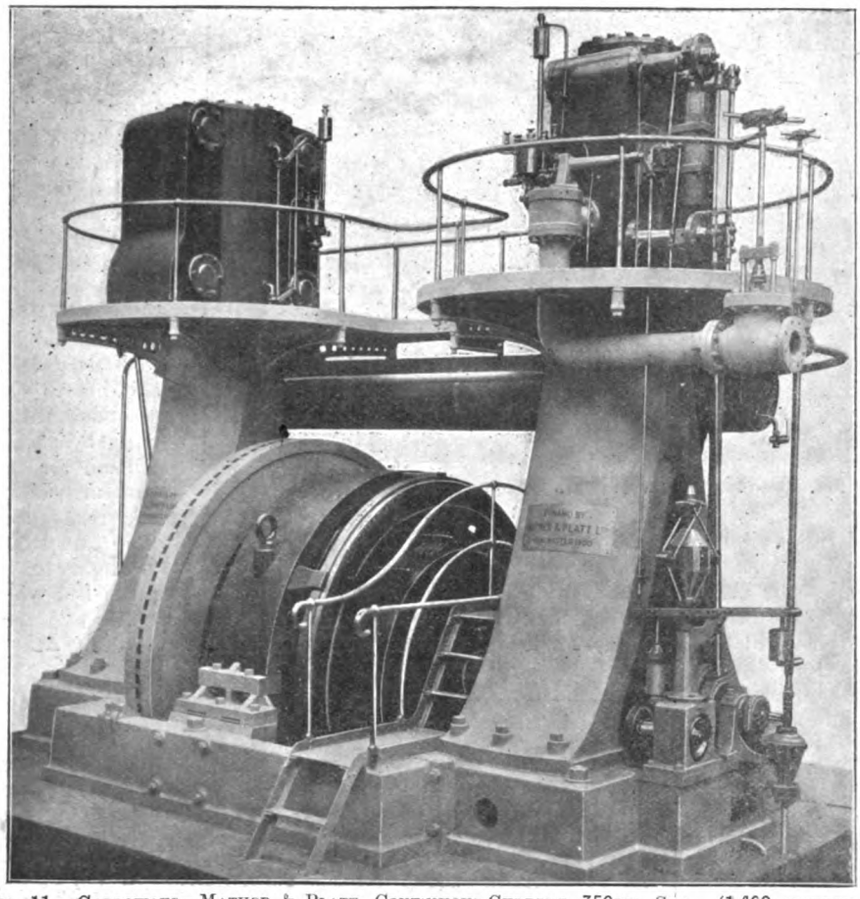

Fig. 11.—Galloways—Mather & Platt Continuous-Current 350kw. Set. (1 400 amperes at 220 to 250 volts; 105 revs. per min.)

Many representative British engine and dynamo builders have not exhibited. The only specimen of a Belliss engine I saw was a diminutive 2-crank one driving an auxiliary machine, hidden by a large French-American generating set, and bearing a French name plate. Messrs. Crompton are only exhibiting instruments, and no Brush, Ferranti, E. C. C., Johnson & Phillips, or Parker dynamos are to be found.

The next article will refer to some of the continuous-current sets of French manufacture.

[Correction.—By a printer's error the name of the chief of the electrical department at the Paris Exhibition, p. 508, second column, in the line immediately above the illustration, has been spelt Picon instead of Picou.]

Copper Mines in Natal.—The special correspondent of the *Standard* at Durban reports that an important discovery of copper has been made in the northern part of the colony, and that the lode is reported to be 4ft. wide.

THE CENTRAL LONDON RAILWAY.

(*Continued from page 433.*)

The Power Station (concluded).—Fig. 30 shows the front of the main switchboard, and Fig. 31 shows the back, viewed from the same end. The arrangement of the instruments on the various panels of this switchboard are shown to scale in the front and back view given in Fig. 32, while Fig. 33 gives a complete diagram of the electrical connections of the switchboard to the main generators, the exciters, the lighting sets, the rotatory converter—which is not yet erected—and the feeders going out from the station to the railway. An enlarged view showing the front and section of a three-phase switch is shown in Fig. 34. Referring to Fig. 32 the four small panels at the left are devoted to the four 50 kw. exciter sets. These feed the exciter 'bus bars through double-pole 400-ampere switches, which possess the novel feature of being made interlocking with the field switch, thus excluding the possibility of opening the field switch of any exciter while the main switch is closed. The main and field switches are double-throw, and in their lower positions are available for supplying lighting circuits, but since at a later date it was decided to have entirely independent lighting sets, the switches will not be used in the lower position. In the main circuit of each exciter there is also a Siemens' minimum cutout. The six large panels to the right of the exciter panels contain the controlling and measuring apparatus for the three-phase main generators, and the two remaining large panels are devoted to the main feeder cables. At the top of each generator panel is mounted a Parshall three-phase double-break aluminum-bladed switch. The construction of this switch is shown in Fig. 34. All the measuring instruments are of the Hartmann and Braun hot-wire pattern. Of the three instruments in the upper row the middle one is a voltmeter connected across the secondaries of a 40:1 potential transformer. There is one such transformer for each generator, and a seventh for obtaining the line voltage. The outer instruments are of exactly the same type as the voltmeter (they all take about one-fourth of an ampere at full scale reading), but are employed as ammeters by being connected in the secondaries of 'bus bar transformers. These two instruments give the current in two of the three phases. The field current is also indicated by a 0·25-ampere hot-wire instrument, but in this case it is connected in shunt to a strip of patent resistance metal which carries the field current. The 10in. handwheel on the sub-base controls the field rheostat connection board, the field rheostat itself being located on iron brackets under the switchboard gallery. The two lower points of the field switch (see Fig. 33) go to the field circuit, the two upper to the exciting 'bus bars, and the two intermediate contacts to the discharge resistance. In this case the discharge resistance is built for 3 ohms, and suitable to carry 40 amperes for 15 seconds without harmful rise of temperature. This is a suitable proportion for taking up the discharge current from the generator field. The field resistance is 0·73 ohm.

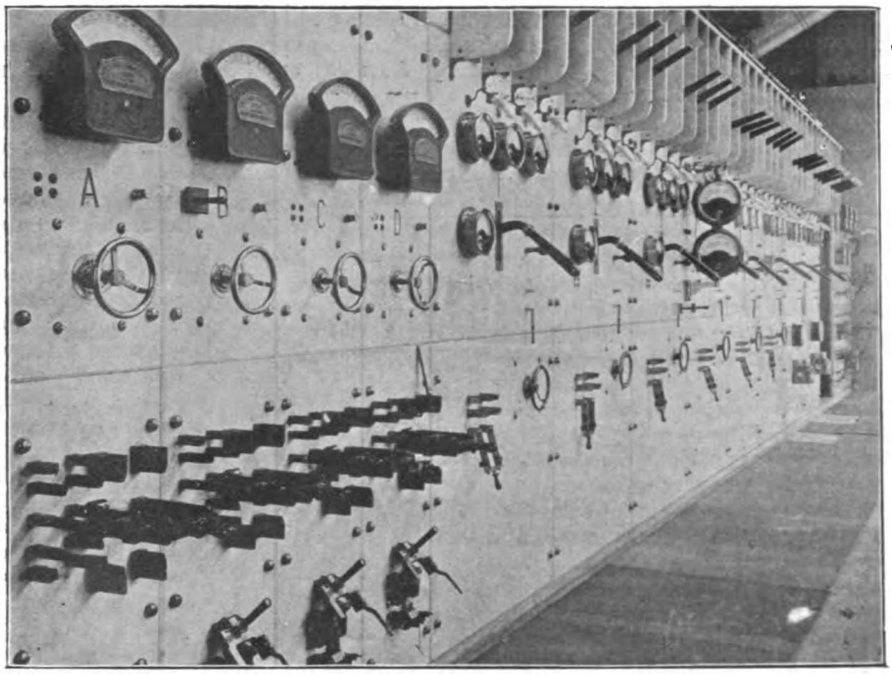

FIG. 30.—FRONT VIEW OF MAIN SWITCHBOARD.

The two large Hartmann and Braun illuminated dial hot-wire voltmeters upon the swinging bracket are used respectively, the upper for indicating the line voltage, and the lower for synchronising. There are also two synchronising lamps above the line voltmeter. On each panel there is a red lamp constantly alight whenever the corresponding generator is excited. Upon the feeder panels there is a 'bus bar transformer ammeter in each of the three phases. The sub bases of these feeder panels each contain a Holden integrating wattmeter, and a Thomson recording wattmeter. The Holden wattmeters are built on quite novel lines, in that

the indicating pointer is not directly operated by the dynamometer coils, which here simply control the movements of a motor, which in turn moves the pointer. The watt dynamometer acts as a relay to close and open the secondary circuit of a small induction motor, so arranged that when the circuit is closed the motor moves the pointer in such a direction as to increase the reading of the instrument. As the reading increases there is a proportionate extension of a spring which is attached to a cylindrical drum on the pointer shaft. The tension of the spring acts on the movable coil of the dynamometer so as to tend to open the secondary circuit. Under these circumstances the motor will increase the reading until the spring force balances the electro-dynamic force of the coils, when further forward motion is impossible, as it would cause the secondary motor circuit to open. As the dynamometer coil has to move through an angle of 1deg. or less there is little trouble from flexible contacts to the movable coil. The induction motor consists of a copper disc mounted on the pointer shaft and a pair of laminated magnets whose poles are brought together so as to leave a slit big enough to allow free motion of the disc. One of the magnets has a coil of very fine wire wound on its pole, and forms the circuit opened and closed by the relay. Each magnet has a magnetising coil, the alternating current for which is obtained from any convenient source of supply. The scale of the instrument covers 300deg., and is uniformly divided throughout.

From the switchboard diagram it also will be seen that, of the four outgoing main cables, two are connected to Parshall overhead type switches, and two to oil-break switches, which will be located below the gallery. These oil-break switches are of very liberal proportions. Next to the feeder panels, an additional panel will soon be installed, leading down to the power-house rotary converter. The other panels for this additional installation will be located in another gallery on a

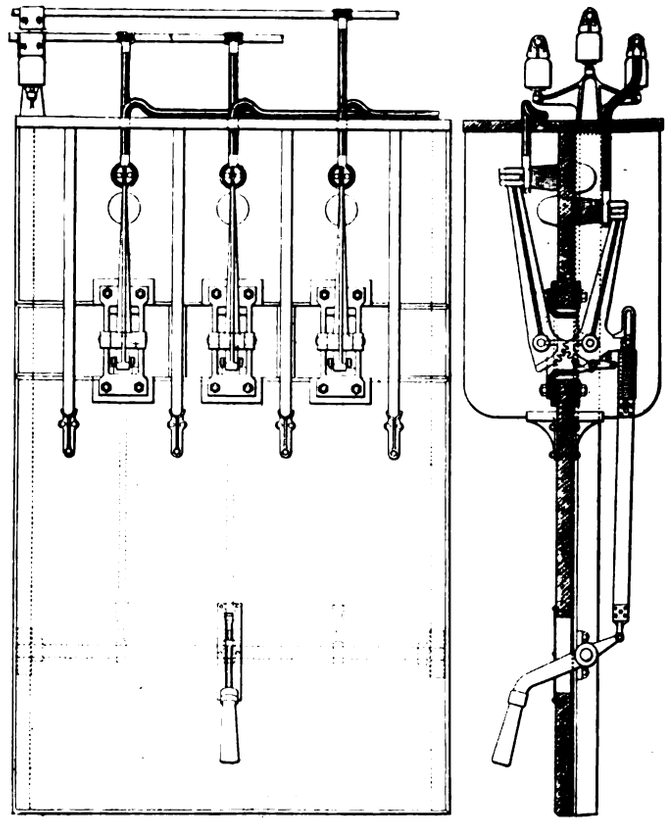

FIG. 34.—GENERAL ARRANGEMENT OF HIGH-PRESSURE, DOUBLE-BREAK THREE-PHASE PARSHALL SWITCH.

Digitized by Google

lower level than the main switchboard gallery, at the east side of the building. The remaining four small panels at the extreme right-hand end of the main switchboard gallery are devoted to the two lighting generators and the feeders for the lighting circuits. They possess no features of especial interest. All the apparatus on these power-house switchboards have a uniform copper finish, which, against the marble panels, present a very satisfactory appearance. It will have been noted that on the front of the panel nothing below the high-tension switch blades is connected to the high-potential circuits. The panels stand 5ft. 2in. forward from the back wall, giving ample room for working behind the switchboard.

(To be continued.)

[Erratum.—We are asked to state that the curve, Fig. 21, in our last article on the Central London Railway, published in our issue of July 13th, is incorrect, and was given us in error.]

CONTEMPORARY ELECTRICAL SCIENCE.

[Compiled by E. E. Fournier d'Albe.]

Effect of Mast Wires in Space Telegraphy.—A. Lindemann has completed a systematic study of the precise influence of the mast wire upon the intensity and the wave-length of the system of waves emitted by a Righi oscillator. He used a horizontal arrangement for the latter, and was thus enabled to attach auxiliary wires on both sides. He found that such an oscillator emits two superimposed wave trains, one of which has the same wave-length as that emitted by the oscillator without the wires, while the other has a greater wave-length, determined by the period of the whole oscillating system consisting of the balls of the oscillator and the wires joined by air sparks. The effect of the wires upon the original wave train of the oscillator is to strengthen it, since waves of the same length, but less damped, are emitted by the wires. The advantage of the wires is the greater the shorter the air-gap separating them from the oscillator. As the air-gap increases the amplitude of oscillation of the whole system decreases in comparison with the amplitude of the original oscillation, and the damping factor increases. When one of the "feelers" was put to earth, and the other left in position, thus approximating to the arrangement used by Marconi, the second wave system could no longer be proved to exist. At least, its wave-length could no longer be determined. Otherwise the phenomena were the same.

[A. Lindemann, *Ann. der Physik*, No. 6, 1900.]

Kinetic Theory of Metallic Conduction.—The laws of metallic conduction will probably soon be brought completely under the theory of electrons, which has lately succeeded in establishing some important fundamental relations between the phenomena of heat, of resistance, and of electrolysis. The ratio of the two conductivities of a metal may be approximately calculated by Drude's electron theory, which involves the number of gas molecules per gramme and Thomson's value of the elementary electric charge. M. Reinganum points out that these two numbers, both somewhat roughly determined, are not really necessary at all, and that the much better known values of the electro-chemical equivalent and the velocity of hydrogen atoms in a gas may be substituted for them. This substitution gives for the ratio of thermal to electric conductivity the number $0{\cdot}7099 \times 10^{-10}$, which is in remarkably close agreement with the experimental values found by Jäger and Diesselhorst, such as $0{\cdot}706 \times 10^{-10}$ for aluminium. In this agreement the author sees a proof that in metals also, as in liquids, electricity moves in separate quantities of the value of the quantities transported by electrolytic ions, and that the principles of the kinetic theory of gases apply to both. If that is the case, our knowledge of the material convection of electricity is about to become as complete as our acquaintance with the ether stresses causing or attending it has already become.

[M. Reinganum, *Ann. der Physick*, No. 6, 1900].

Theory of the Coherer.—From a series of measurements of the difference of potential between the terminals of a coherer observed when different E.M.F.s are applied and different currents sent through, K. E. Guthe and A. Trowbridge have arrived at the conclusion that the high original resistance of the coherer is due to a film on the surface of the metallic particles, and that the reduction of resistance by electromagnetic waves is due to some kind of electrolytic transfer of ions across this film, resulting eventually in a deposit which bridges over the gap, and attaches the particles to each other. As the current through the coherer increases, the resistance falls, and the difference of potential at the terminals of the coherer tends asymptotically towards a limit P. This P is the potential difference over a molecular layer of ions in which there flows through each ion the maximum current it can carry. The authors point out a remarkable relation between the P of any element and its gramme-equivalent. The product of both is constant, and its value is about 6. For steel P is 0·23 volts, for copper 0·173 volts, and for lead 0·127 volts. The asymptotic limit of P may have some connection with the peculiar apparent resistance of the arc. The authors make PbO_2 and CuS agree in their behaviour with this modification of Lodge's theory by supposing that they are broken up into two components, one of which conducts well, while the other conducts poorly.

[Guthe and Trowbridge, *Phys. Review.*, July, 1900.]

Electric Effects of Light upon Green Leaves.—Under certain favourable conditions, which are not as yet completely determined, green leaves show a true electrical response to light, consisting in the establishment of a potential difference between the illuminated and the non-illuminated half of a leaf which may amount to 0·02 volts. This effect shows a remarkable similarity with the effect of electric excitation upon nerve and muscle. In the human nerve substance, electric excitation causes a current from the resting to the active tissue, followed after a few seconds by a smaller current in the opposite direction. In Iris leaves, the current flows from the illuminated to the shaded half of the leaf during illumination, and in the opposite direction for about five minutes after the illumination has ceased. The response takes about four seconds to set in, and it is only the young and growing leaves that show any response. When the stimulus is repeated, a certain amount of fatigue is shown, as in all organic structures and even in some inorganic substances. But no fatigue is shown when the leaf is given an hour to recover between each stimulus. The tobacco plant acts like Iris, but in Tropæolum and other plants the currents are in the opposite direction. That chlorophyll is essential to this photo-electric reaction is shown by the fact that the petals of flowers do not show it.

[A. D. Waller, *Commun. to Royal Society*, read June 14, 1900.]

Vacuum Phenomena of Nitrogen.—The effects presented by an electric discharge through nitrogen are of a particularly complex character. Very minute quantities of a foreign substance are capable of altering the aspect of the discharge considerably. This is particularly the case with the fluorescence of the walls of the tube, which P. Lewis has recently studied. He found that when nitrogen prepared from ammonium nitrate and sulphate and purified over hot copper was pumped through an H-shaped vacuum tube, the whole wall of the tube showed a brilliant temporary fluorescence, which extended for about 1 metre into the supply and exhaust tubes. This temporary luminosity, which the author terms B-fluorescence, was confined to the wall, as could be shown by heating a small portion of it. At that portion the luminosity disappeared, but reappeared on cooling. The whole phenomenon lasted only a few seconds, but could be made permanent by keeping the pump at work and thus supplying a continuous stream of fresh nitrogen. Spectroscopic examination showed that the fluorescence was dependent upon the presence of a number of bands in the extreme ultra-violet, which are due to a combination of nitrogen with oxygen. It is therefore likely that very minute quantities of oxygen are the cause of the phenomenon, though larger quantities stop it altogether.

"THE ELECTRICIAN" PRIMERS. In Two Vols. Paper covers, 2s., post free 2s. 2d. each; strong cloth 2s. 6d., post free 2s. 8d. each. Single Primers 2d., post free 2½d.

WIRELESS TELEGRAPHY: Signalling across Space without Wires by Electric Waves. By Dr. O. J. Lodge. New Edition. Price 5s. net.

A DIGEST OF THE LAW OF ELECTRIC LIGHTING, ELECTRIC TRACTION, TELEGRAPHS, TELEPHONES, &c. A. C. Curtis-Hayward, B.A. To January, 1900. Price 3s. 6d., post free.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By Francis Jehl. Price 10s. 6d., post free.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. A Practical Guide to the Establishment of a Carbon Manufactory. Price 1s. 6d., post free.

THE STEAM ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. Beaumont. Price 3s. 6d., post free.

FULL CATALOGUE POST FREE ON APPLICATION.

"ELECTRICIAN" SERIES FORTHCOMING BOOKS.

THE ELECTRIC ARC.—By Mrs. Ayrton. This work is in the press, and will contain an historical sketch of the early experiments on the electric arc, as well as the important results of recent research.

PRIMARY BATTERIES.—A work on this subject will shortly be published bringing the theory and practice of the Primary Battery up to date. The book will be fully illustrated.

SECONDARY BATTERIES.—By E. J. Wade. Fully Illustrated. The Author in this work will deal briefly with the theory and fully with the chemistry, design, construction and manufacture of secondary batteries or accumulators.

"THE ELECTRICIAN" WIREMAN'S POCKET-BOOK.—Edited by F. C. Raphael. "The Electrician" Company will shortly publish a valuable pocket-book for the use of those engaged in wiring work, both external and internal.

THE TELEPHONE.—By Dahn Sinclair and F. C. Raphael.

SPECIAL NOTICES.

NOW READY.—Vol. XLIV. of **"The Electrician"** (950 pages), bound in strong cloth. Price 17s. 6d., post free 18s. 6d. Also ready, Cases for binding. Price 2s., by post 2s. 3d.

A complete set of "The Electrician" (1878-1900) can now be supplied. These sets are very scarce, and early application should be made.

NOW READY.—**"THE ELECTRICIAN" READING CASE.** Holds four copies of the Journal. Strongly made and corded for hanging. Price 1s.; post free, 1s. 4d.

LIGHT-LOAD LOSSES.

No doubt the surest way to reduce light-load distribution losses in an alternating-current supply system is to convert it to a continuous-current system; and perhaps it was owing to this somewhat obvious answer to the question implied in the title of Mr. Boot's recent Paper that the discussion on it at the Municipal Electrical Association was brief and brought out no new facts. Yet the subject should be one of the greatest interest to engineers of alternating-current stations, for these all-day losses in the distributing apparatus militate more than anything else against the financial success of their undertakings, and it is not in every case that the drastic remedy mentioned above can be applied. The adoption of alternating-current systems in so many cases in which, even at the low limit of "declared" pressure formerly imposed by the Board of Trade, continuous current would have been more economical, has to some extent been due to the convention, at one time accepted by the majority of electrical engineers:—Continuous current for "compact" districts; alternating current for "scattered" districts. Every engineer in designing a supply system hoped that his district was a "scattered" one. He desired as large a load as possible, and trusted to create a demand for electrical energy from the residential districts round the outskirts of his town. The electric light, instead of remaining a luxury became soon a business necessity, and now every engineer knows that even with the Wright maximum demand tariff system, a small public house is probably a better customer than a large "residential mansion." Had not Parliament from the outset set its face against preferential charges, the Temperance League would doubtless have found itself compelled ere this to start a crusade against the methods of the supply station engineer.

But to return to the subject of diminishing the all-day losses on an alternating-current system in a district where the probable increase in demand is not sufficient to warrant a complete or even partial introduction of continuous-current supply. Mr. Boot's long Paper can be resolved into an almost unnecessary recommendation to use the best and most efficient transformers, and a recommendation to switch out transformers from the secondary network during the hours

Digitized by Google

of light load. The second recommendation might also seem to be an obvious one were it not that 13 out of a total of 15 supply station engineers who replied to the enquiries in Mr. Boor's circular letter do not follow this practice regularly. Of course, as with all other debatable questions in electrical engineering practice, its solution must depend on the special circumstances governing each particular case. In a large system such as the alternating current ones in London, it is obvious that a considerable saving can be effected by this means, so much so that at several sub-stations in the metropolis at least one man is employed continuously for several hours a day. But in the case of sub-stations with smaller outputs, although the loss may be the same proportion of the whole output, it is intrinsically less important than before, while a man's wages remain more or less at a fixed figure. It is thus that a large number of station engineers find it more economical to put up with the all-day magnetising losses as a necessary evil inherent to the alternating-current system, than to try and reduce them by increasing the item of wages. Mr. Boor's figures as to the amount of these losses at Tunbridge Wells are not very clear, but taking it even that nothing but the actual losses at no-load are represented in the £200 he mentions, the saving, say, of half this at the expenditure of an additional £50 a year in wages would only just be worth while, and would be no great economy; besides, the additional risk is brought in of a breakdown of the diminished transformer plant in the daytime through overload if the sky were suddenly overcast by a fog or thunder-cloud. With smaller loads than at Tunbridge Wells, therefore, it would seem that, with a fair number of sub-stations, it would hardly pay to switch transformers on and off according to the magnitude of the load unless an automatic device can be made which will do this with certainty. When, however, the sub-stations are comparatively few in number, the cost of sub-station switchboard attendance need not be great, for, as the attendant would only have to manipulate the switches at the times that the load was coming on and going off, he could perform other duties as well. In such cases it would often be economical to combine the sub-station with central offices, stores, meter and lamp testing room, or a drawing office, which need not be in immediate proximity to the works.

Coming now to the question of automatic switches for this purpose, there is a possibility of a compromise between an absolutely automatic arrangement and an attendant. Two years ago (Vol. XL., pp. 391 and 393) we described two automatic devices for switching in transformers as the load increased. Of these the one which appeared to us to be constructed on the most solid lines unfortunately only cuts transformers in but does not cut them out again, thus effecting but half of the desired saving. This apparatus, due to Mr. A. H. Walton, who was at that time with the Metropolitan Electric Supply Co., has, we believe, proved itself thoroughly useful in the sub-stations of the company. The other device, due to Mr. Alfred Schlatter, was most ingenious; but although it was said to have proved its value for eighteen months in Budapest, we do not believe that it has been used extensively elsewhere, probably owing to a natural distrust evinced by electrical engineers towards mercury contacts in high-pressure apparatus. An alternative worthy of consideration is an electrically actuated switch, worked, not automatically by the current in the transformer falling to a sufficiently low value or rising to a sufficiently high one, but simply controlled by a switch on the main switchboard of the supply station. As the sub-station switch would only be in motion a few minutes each day, a strong current drawn from the secondary network could be used for working it, while at the same time the mains leading to the station need not be heavy, as for the short time they would carry current a considerable overload would not have time to heat them. The current flowing from the sub-station 'bus bars could be read off in the station by an ammeter of the shunted Weston type, the main circuit resistance to which the instrument was shunted being of course in series with the sub-station 'bus bars. In considering the value of such an apparatus, the degree of reliability and the capital cost have to be weighed on one side against the cost of the wasted kilowatt-hours on the other side. Probably in most cases the balance will be against the automatic or electrically controlled apparatus, so that the choice will once again lie between switching off by an attendant or allowing the all-day magnetising current to be wasted. The moral is, however, that it is the wisest practice to diminish the number and to increase the size of the sub-stations as much as possible, and to place them in easily accessible situations. This having been accomplished, it should be no difficult matter to arrange for the necessary switching in and out being done by hand at the two critical periods of the day.

THE REDUCTION OF LIGHT LOAD LOSSES IN ALTERNATING SUPPLY WORKS.*

BY HORACE BOOT, M.I.E.E.
(Corporation Electrical Engineer, Tunbridge Wells)

The question of light load losses in electricity works, be they continuous or alternating, deserves more attention from engineers than it has hitherto received. These losses might be divided under two heads—viz.:—

Work Losses.—(1.) Fuel used in keeping up steam ready to supply. (2.) Radiation losses in boilers, separators, brickwork, steam and drain pipes. (3.) In running larger generators at light loads to enable the voltage to be kept constant, should motors or other apparatus requiring heavy starting currents be in circuit. (4.) Wages paid to the men during the hours of light load. (5.) Interest and sinking fund on the buildings and machinery during light load hours.

Distribution Losses.—(1.) Losses in transformers (magnetising watts). (2.) Losses in the shunts of meters. (3.) Interest and sinking fund on capital, outlay on cables and distribution appliances. (No. 2 and 3 apply equally to alternating and continuous systems, but No. 1 only applies to the alternating, except where continuous-current transformer systems are in use.)

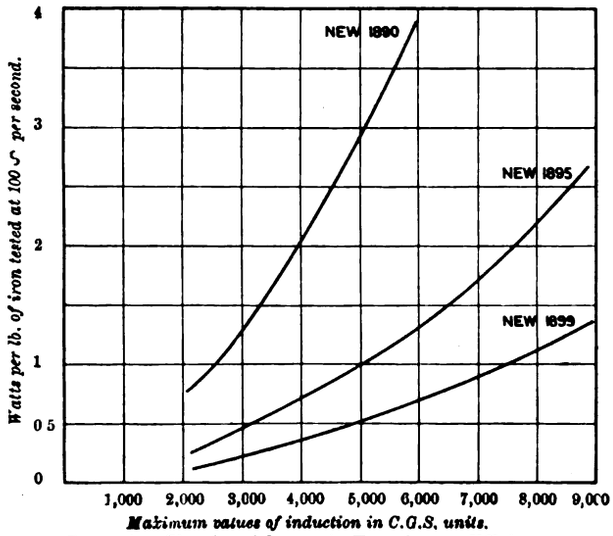
The author does not purpose in this short Paper dealing with the losses under the works heading, as there are many ways in which these can be reduced to a minimum, but he has not yet come across a system, be it direct or alternating, in which these in the course of a year do not total up to a very large amount which would make an appreciable difference in the cost of supply if they could be overcome. In distribution, the most important losses requiring consideration, and which are more or less complicated, are the transformer losses during light loads, and, since it is increasingly evident that in the near future transformers dealing with alternating currents of mono, di or polyphase, will be used by both what are now known as "continuous-current" and "alternating" engineers it is important to both sections to endeavour to meet these losses and to ascertain the manner in which they can best be reduced to a minimum. Low-tension engineers of a few years ago are all of them propounding schemes involving high pressures, and it is notable that all these schemes propose using alternating currents and transformers or motor generators. There is a concensus of expert opinion that the most economical way to supply electricity over large areas and on a large scale is by a form of high-tension transmission, and therefore the author does not feel called upon to apologise to his continuous-current friends for wasting their time over problems which they now see they will have to tackle in the future.

The transformer losses may be divided into "iron" losses and "copper" losses, the iron losses being dependent upon the eddy current loss, varying of course with the temperature and periodicity, and the contact between the adjacent plates and hysteresis loss depending upon the quality of the iron and the temperature to which is is heated, the E.M.F. curve, and the maximum induction; also, a not unimportant item, the mechanical strains and stresses to which it is

* Paper read before the Municipal Electrical Association, at Huddersfield, June 21.

Digitized by Google

exposed. The copper losses may be summed up as the C^2R loss due to the magnetising current and resistance of primary winding. These, of course, again vary as the square of the current, the resistance of the copper, the temperature to which the winding attains, sectional area of same, and the length. The author has found, however, that the C^2R loss, due to magnetising current, is about 0·20 per cent. of the maximum output. It is important to note that the limit of work which a transformer can undertake is governed by the overheating permissible, as this exercises a very important function when short circuits on the distributing networks take place, as the transformer only requires to be fused to its burning up limit, which is usually very much higher than its output. It will be seen that it is important to design a transformer in such a manner that it has sufficient means of radiating its heat, as only in that manner can a transformer be kept within decent limits in weight and size. With regard to improvements in transformers, it is interesting to reproduce a curve having for ordinates the watts per pound of iron tested at 100 frequency, and for abscissæ the maximum volts of induction in C.G.S. units, for which the author is indebted to Mr. Berry. From this it will be seen that the efficiency of transformers has advanced enormously since 1890. This increase of efficiency plays a very important part in the light load losses, as by comparing efficiency curves it is now possible to obtain an all round efficiency, including light load hours, of something like 94 per cent., that is, taking 20 hours at no load, two hours at full load. Many works, however, are fortunate in obtaining a longer period of load. Comparing the efficiencies for the last 10 years, there has been an improvement of something like 16 per cent. It therefore will be seen that one of the ways to reduce light load losses, *is to instal transformers of high quality.* It is of course apparent to anyone that the copper losses from the all day efficiency point of view are of less importance than the iron ones, because the iron like the poor, "is always with us,"



Curve A. Showing Advance in Transformer Efficiency.

whereas the copper losses do not play such an important part until the transformer becomes loaded. The ageing of the iron is a very important matter, and the author has found, from tests carried out, that in the case of old transformers the effect of age has been to increase the magnetising watts by as much as 45 per cent. This should not be the case with our present knowledge, as in the case referred to it was due to the number of lines forced through the iron to a very large extent, whereas if the iron density had not been pushed so far, also the temperature limit both in the iron and in the copper, there is no reason why the watts taken to magnetise should have increased so enormously. In other instances tried by the author they have increased 10 per cent. after nine months' use. He thinks it is here that in all probability our systems put down with English plant will eventually show their superiority over American-made machinery, as it is well known that Americans load their machinery up to the limit. In his transformer specifications the author finds it necessary to insert a clause that the tests on the core losses shall be taken after the transformer has been six months at work on its full load, and he is even of the opinion that this six months would be better if it were 12 months, because a transformer appears to get better as it gets older, until it reaches a certain point, and then the increase in iron loss runs up. The ageing which increases the iron loss can be governed by temperature rise, the quality of the iron, and the strains of a mechanical nature to which it is exposed when in use.

In a table below are given the actual tests obtained from different sizes of transformers in sub-stations in Tunbridge Wells, showing the increase in magnetising watts with age, also the number of watts

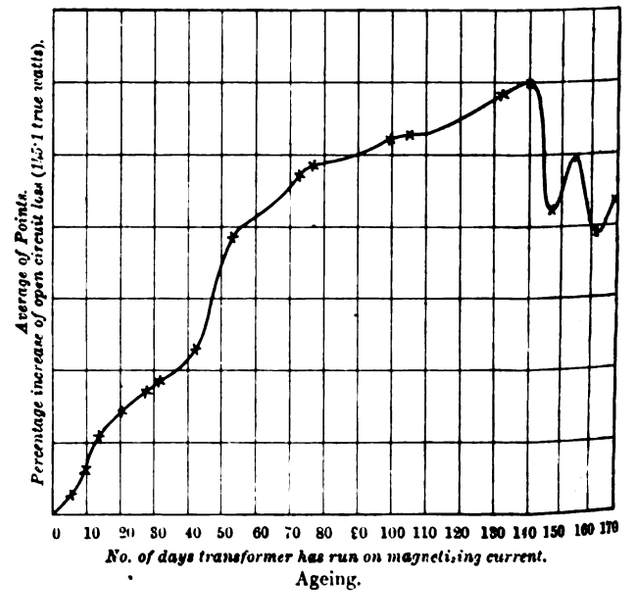
used on large transformers (calculated) during the period of light load. This is important, as from these figures can be calculated the saving that can be effected by switching the transformers in or out, according to the conditions of load, making, of course, provision for the labour, interest and sinking fund required for doing this.



Ageing.

With regard to ageing of transformers, there is an interesting curve published by the London Electric Supply Corporation, in 1895, and which, with their kind permission, is reproduced here.

The author has calculated that at Tunbridge Wells the units generated during the period of no load in 1899 amounted to 32,120. The units supplied to the transformers in circuit, calculated taking the same number of hours equals 10·75 × 3,000 hours = 32,250, and the total number of units generated in 1899 equals 466,901, showing that the number of units due to core loss amounts to 6·09 per cent. of the whole. The cost of supplying these "core loss" units (1·5d. per unit) amounts to £201. 11s. 3d., and it is this figure which the author is hoping at some future time to save entirely, and then he will be in the same position as his "Continuous Current Friends" so far as efficiency of distribution goes. By adopting the

Digitized by Google

network inter-connection system and running a sufficiently large L.T. main into the works, or, if the works are situated some distance from the distributing area, supplying the whole of the distributing networks from either the works or one sub-station, the whole of the loss, with the exception of that occasioned by the use of one transformer, can be saved, against which, however, must be balanced the labour involved in visiting these sub-stations twice a day for the purpose of switching on and off the primary and secondary. The switchgear in these sub-stations should be as simple as possible, so that it does not require a particularly skilled man to operate same, nor should it be possible for him to kill himself. A few years back Mr. Walton (then chief engineer to the Metropolitan Electric Supply Co.) brought out and patented an automatic transformer switch, to switch in the transformers on both the primary and secondary, as soon as the load became sufficiently heavy to require a supply from that transformer. These have been in use since March, 1897, at the sub-stations in Marylebone-passage, Brook-mews, Rathbone-place, and I believe the London Electric Supply Corporation and the Brush Provincial Co. are also using them. This automatic switch is most useful in towns subjected to sudden demand, as the engineer can rest assured that a sufficient number of transformers will be switched in to cope with the load, and will not have to depend upon the vagaries of human intelligence. It is, of course, easy for any station engineer to calculate the saving effected in switching off these transformers; which becomes more marked in towns with a poor load factor, and in the provinces, where sudden heavy demands are almost unknown, from the following formula :—

$$\frac{\left\{\begin{array}{c}\text{The number of hours}\\ \text{per annum the trans-}\\ \text{former is not loaded}\end{array}\right\} \times \left\{\begin{array}{c}\text{the cost per Board}\\ \text{of Trade unit to}\\ \text{generate}\end{array}\right\} \times \left\{\begin{array}{c}\text{core loss in}\\ \text{units}\end{array}\right\}}{1{,}000}$$

Another advantage to be obtained by being able to cut out all transformers during the hours of light load, is that it places all the feeders, with the exception of one perhaps, at the disposal of the mains superintendent for testing purposes, or working thereon, and then there can be no excuse for not keeping them in perfect condition as they can be tested daily.

The question of the best position for fuses in the H.T. feeders is a very troublesome one, and the author has found that the safest place to have fuses is at the works, and at the works only, especially when we get to the condition of things where transformers never go wrong; as, unless fuses are constantly watched in the sub-stations, and frequently changed, no reliance whatever can be placed upon them. I venture to think, in the analysis of the number of extinctions, and the cause, 75 per cent. could be put down to the erratic behaviour of fuses, both on the H.T. and the L.T. side, and for that reason fuses should only be inserted where it is dangerous to do without them. In the distributing networks I have not found it necessary to insert fuses, except at the point of inter-connection as above stated. This method of reducing the light load losses to the minimum, unless precautions are taken, may introduce serious results, and be the cause of cables and transformers breaking down. Some time ago Mr. Hay wrote an article proving that when breaking a current, at the instant of breaking the current it had a higher value than its normal maximum, the core being left more strongly magnetised than when under working conditions. In some experiments carried out with transformers, it has been proved that transformers do not, as a rule, break down at the instant of connection, but the core settles down to the ordinary cycles of magnetism gradually, and there is no rise in P.D. across the terminals; but if they break down the damage was done when switching off. It would be interesting to hear from other members if they have found the life of the cables and the transformers, when intermittently used, to be shorter than when they are in constant use; beyond the strain of switching on and off, the author does not see that there should be any difference unless the transformers get unduly heated, in which case the continual heating and cooling may do mechanical damage. There is another danger which may be introduced at the time of switching in and out, viz., the capacity effect; but, provided care be taken to switch *in* the outer conductor first, and switch *out* the inner conductor first, it is unlikely that the conditions will be such as to break down the cable. Experiments were performed by Prof. Fleming and Mr. Alexander Siemens on the Deptford mains, which will be within the memory of the members, and the able articles written at the time with respect to the same are worth studying. One of the points to be borne in mind, however, is to avoid any discontinuities in the outer conductor of a concentric cable, and this can best be secured by earthing the outer without any fuse in circuit. This subject was ably treated by Mr. Gisbert Kapp, in the *Electrotechnische Zeitschrift*, December 28, 1899, in which he depicts some conditions into which we unhappy alternate current engineers may get and break down our cables. However, it is rarely that these conditions are present, but it is always advisable to take precautions, such as the adoption of Neufield's rule for switching in and out: "The earthing of the outer conductor, and omission of all fuses in the outer."

It is important that transformers should be constructed to withstand a considerable load for a short period, as, when such is the case, it is possible to use a transformer that will be fairly well loaded at normal times of heavy demand, and occasionally withstand a great deal more. In some of the transformers the author has tested there appears to be very little limit to their overloading capacity, one in particular, a 5kw. transformer, easily withstood a load of 12kw. without burning up; but he finds that when the larger sizes are dealt with the manufacturers are not so generous in giving more than you pay for. From calculations and tests made, it appears that about 140 watts are wasted in core losses for every 1,000 watts supplied to the lamps. Considerable economy may be gained in distribution by keeping the number of sub-stations to a minimum; in fact, the Board of Trade alteration in the permissible pressure of supply has been an immense boon to alternate-current as well as to continuous-current engineers. The insulation of the distributing mains is better maintained in the case of alternating than appears to be the case in continuous-current distribution systems, in which, by increasing the pressure, "shorts" and other troubles have been experienced. Taking the cost of coal, which in Tunbridge Wells is very heavy, at 1d. per unit, the cost of energising the transformers on circuit amounted to £137. 3s. 4d. in 1899. In order to overcome this loss, it is necessary that the L.T. networks supplied from the various sub-stations be inter-connected, as it is then possible to switch off all the transformers, except one, on both primary and secondary. For this purpose, the author has arranged the networks so that they can be fed in the daytime from a transformer situated at the works, and the whole of the transformers in the sub-stations can be switched out of circuit. This at once reduces the light-load losses from 10,750 watts to 590 watts, against which, however, has to be put the cost of the extra switchgear and men's wages, unless an automatic switch is used; but it will be seen that this arrangement enables the feeders to be tested every day, worked upon, and kept in perfect order, without in any way discontinuing the supply, which, as prescribed in the act, is continuous during the 24 hours. In towns where it is possible and economical to build a large sub-station and make it a centre of distribution, transformers can be banked, and it is usually arranged for one man to attend to these, but in Tunbridge Wells the area is very extensive, and no particular sub-station can be looked upon as the feeding centre, so that the most economical way is to place one large transformer in each instead of providing several small ones and switching them in as the load comes on.

The author has found from experience that the most satisfactory arrangement for fuses on the outer networks is to make them comply with the following conditions: Each transformer sub-station should be allotted a certain small area, which should not exceed the maximum load of the transformer at the time of full demand even if it were isolated from the other sub-stations. A fuse box on the distributors should be inserted before connecting that particular transformer area with the other network area. This is what he has carried out throughout and found to work admirably.

It is advisable to test the transformers at least once a year, to obtain the magnetising watts on open circuit, and the full load voltage drop, and compare them with the previous tests, and, in most instances it will be found advisable to scrap the old transformers, and buy others more up to date having more permanent efficiencies. With a reduction of frequency to a standard of 50 periods, many alternating troubles would disappear, such as impedence. With regard to skin effects, Lord Kelvin showed that the current only penetrated to 0·0393 of an inch after increasing the frequency above 150, but the loss occasioned by this may be more or less neglected with low periodicities.

A very important point to bear in mind in alternate-current distribution is to keep the power factor as near unity as possible. This problem is not easy, and is often the cause of great loss in efficiency. The effective volts and amperes rarely exceed 0·75 of these apparent: it may be much less than this when motors, arc lamps, and various inductive apparatus are in circuit. This wattless current loads up the armatures and the cables, producing considerable phase difference. However, provided the frequency is kept low, the difficulties can be overcome, as the current lagging in phase depends upon the inductance in circuit and the periodicity. Various suggestions have been made for introducing capacity in order to give lead, and thus nullify the lag in an alternate-current circuit caused by induction, but the author is not aware of any system being in operation in this country. When it is necessary to calculate actual resistance these effects present difficulties, as it is apparent that the resistance must change according to the kind of load.

Another source of waste, although of not very large moment, is the energising watts supplied to maintain the shunts of the meters when no energy is being consumed. It will be seen that there are 1,000 meters on circuit, all of them taking a small amount, and most of them taking that amount for 20 hours out of the 24 for no purpose that a saving would be effected if this shunt were cut out when no current was flowing through the series coil. The autho has introduced into Tunbridge Wells a small

* Full-load current at present about 300 amperes.

relay, which is governed by the current in the series coil, and is made to close the shunt circuit of the meter immediately 0·1 of an ampere flows through it. The arrangement is simple and works admirably: the three points in its favour being: (1) It prevents consumers complaining of the noises their meters are making all day long, when there are no lights burning; (2) it prevents consumers thinking that the meter is registering when they are not using any energy; (3) it saves the wasted watts during the time when the meter is not registering.

In conclusion, in order to reduce the light-load losses—(1) The low-tension distributing network must be interconnected, each sub-station interconnection being by a fuse on both poles; (2) the supply can be given by one transformer, preferably situated at the works, and so arranged as to feed the whole networks; (3) in each sub-station, switch gear must be arranged to disconnect the primary from the source or sources of supply, and the secondary winding from feeding or being fed by the low-tension network; (4) unless automatic switches are used, it is the main's superintendent's duty to arrange with certain men on their way to work to open the switches, and switch in the transformers at sunset; (5) the feeders should be so arranged that during the hours of daylight they can be tested and all pressure removed. In some instances, of course, this would necessitate cutting off the supply to a few isolated houses which may have separate transformers, but, no doubt, this could be arranged in the price charged to these consumers, as they would be situated outside the "compulsory" area.

The following is an abstract of the discussion on the above Paper:—

Mr. L. ANDREWS (Hastings) had made a test upon a new feeder and sub-station to see what saving was effected by switching off transformers; he found that he saved watts, but not current. He thought the loss was due to using too large plants during the daytime. The object of a fuse should be not to prevent the transformer from being overloaded but to protect the feeder.

Mr. H. FARADAY PROCTOR (Bristol) said Mr. Boot mentioned the noises which meters made all day long. He did not think, however, that anyone should have a meter which was an anoyance, as there were plenty of silent meters. With reference to the watts wasted in the shunt, he considered that in a good meter this would not come to more than 1s. 6d. per annum, and therefore was not of much account. Mr. Boot thought the supply could be given from one transformer; but in Bristol the area was so large that this could not be done. He believed that the amount of current consumed would not be more than 4d. per hour for the whole of the sub-stations mentioned, and he thought the wages of a man engaged in putting on and disconnecting the transformers would come to much more than this. If the low tension side of the transformer was put on first, when connecting up, there was not the least fear of the rise in voltage, and when taking the current off the transformer the high-tension side should be taken off first.

Mr. H. S. RUSSELL (London) said the subject did not concern manufacturers so much as the engineers. The idea of scrapping the transformers was a good one from the manufacturers' point of view. The question of ageing, which Mr. Boot dealt with, was not so simple as it appeared.

Mr. C. A. L. PRUSSMAN (Doncaster) thought it would not be possible to adjust matters by means of an automatic relay to act with 0·1 of an ampere through the shunt circuit when these meters had been fixed in damp places for some time. He did not think much would be gained by inserting automatic relays as there was the capital cost of these to be allowed for.

Mr. H. L. P. BOOT (Tunbridge Wells), in his reply, said the method of switching on and off the transformers should be left to each engineer to decide what was best in his particular case. Fuses were an abomination to the electrical engineer, and as soon as he found that transformers did not break down he would do away with the fuses altogether. He thought in the case of Bristol they had so much noise in the streets that they could not hear the meter, but in Tunbridge Wells it was very annoying to anyone in the sitting-room having a nap to hear the noise of his meter. He thought if Mr. Proctor inquired of his meter inspector he would find that consumers also complained in Bristol. He had found that the best system of distribution with the least trouble was to have each sub-station and network absolutely independent of any other, and if possible he would only have one feeder to each sub-station. Mr. Russell made a remark about scrapping transformers, but he (Mr. Boot) did not recommend this to be done indiscriminately, but only those which were very inefficient.

A FRICTIONLESS MOTOR METER.

The following is an abstract of the discussion which took place at the Institution of Electrical Engineers on Mr. Evershed's Paper with the above title:—

Mr. T. D. LOCKWOOD, of the Bell Telephone Co., Boston, U.S.A., said it was a pity it was impossible to reproduce in the proceedings of the Institution the beautiful experiments they had seen, or the manner of the speaker; it was impossible to reproduce anything but the dry text of a Paper—although the text did not happen to be dry in this case. The difficulty Mr. Evershed had mentioned of learning what had been done before in the same direction was a difficulty which he apprehended occurred to most of them. He had read any number of English, American, and foreign specifications, and had come to the conclusion that it was very difficult to learn anything out of 99 of 100 of them. If the picture was all right the text was all wrong, and if the text was all right the picture did not agree with it. Mr. Evershed had also said that he did not know, until he had far advanced with the production of his meter, that anything in the same line had been done before. He (the speaker) was reminded by this of a passage in the preface of one of the first books ever written on electric lighting: "The people of former times had very little honesty, as they have stolen all our best inventions."

Mr. S. Z. DE FERRANTI could quite understand Mr. Evershed when he stated that he had been working for 10 years at this subject. If he had said more than this—were it not for Mr. Evershed's age—he would

Digitized by Google

not have been at all surprised. He thought that perhaps the author had not sufficiently appreciated how frictionless some other meters actually were. He remembered in 1885 he was struck by a very curious occurrence to one of his meters, which first made him think he had discovered some marvellous new circumstance quite beyond his comprehension. One day when the current was turned off from one of his mercury meters—which he might mention were very "frictionless"—he found that the meter rotated without any connection whatever with an electric circuit, and that it also rotated backwards. It was watched very carefully and the meter continued to move backwards for two days. It was eventually discovered that owing to the jambing of the sixth or seventh wheel of the meter, the spring in the other wheels was sufficient to give a driving power to run that meter at an exceedingly slow speed backwards for two days. He found that a mercury meter constructed to register up to 300 amperes started with certainty with 0·1 ampere or 1/3,000th of its normal full load current. This was not 1/3,000th of the power but simply 1/3,000th part of the current, so that the internal friction of the apparatus—notwithstanding the residual magnetism which helped to start the meter—must be exceedingly small. It was very important in this particular class of meter that the little fan which was immersed in the mercury should be perfectly balanced, and elaborate precautions were taken that it should be so, as if not, the meter was a little bit out of level, and this interfered with the starting. They had had a certain amount of trouble, and had found out that a serious source of trouble in this direction was in varnishing or lacquering the fan immersed in the mercury more thickly on one side than on the other, as this displaced more mercury at one time than another and so put the meter out of balance in the mercury. He would like to point out that the Aron meter practically disregarded friction, and there were also other meters of that kind. There was, however, one objection to the Aron meter, as also to Mr. Evershed's—viz., the ticking noise. With regard to his own meters which he had mentioned, all these were practically speaking frictionless on the pivots, because they were compound balanced in air and mercury, and he did not think the friction due to the pivots was any greater than that of the bottom pivot in Mr. Evershed's meter. With regard to the commutator of this meter, he thought everybody would agree that it was a most beautiful thing. The nearest approximation to it was the one devised by Lord Kelvin, in which the commutator parts were rigid but the brushes were made up of a number of discs whose edges were split and turned up and then pressed against the commutator, thus forming a flexible electric contact. His own idea of this whole subject, without wishing to detract in any way from the most beautiful work done by Mr. Evershed, was that this meter was greater in scientific merit than in commercial value. Of course this was only a conjecture, but what he had found in the hard practice of having to satisfy all sorts of people wanting electricity meters was that they asked for the most absolute simplicity, and if they got this they were willing to sacrifice a good deal. He hoped that nothing he had said would detract from Mr. Evershed's work, because really he thought it was most splendid; he further hoped the meeting would excuse the mention he (Mr. Ferranti) had made of things that had occurred in his own meter experience, as, without mentioning himself, he could not have put some of these curious points before them.

Mr. REGINALD WOOD said he had attended that meeting specially to say that he claimed to be the inventor of the magnetic suspension exactly as Mr. Evershed had described it. This was rather a nasty thing to have to say, because in reading the Paper he could not help admiring the whole instrument, especially the electromagnetic connections between the motor and the train gear. He had really nothing but congratulation for Mr. Evershed, and hoped his claim would not be considered ungracious, although he was afraid it was.

Mr. W. M. MORDEY agreed with Mr. Ferranti as to the importance of simplicity in a meter. Although he admired the way in which Mr. Evershed had worked out this instrument he was of the opinion that commutators

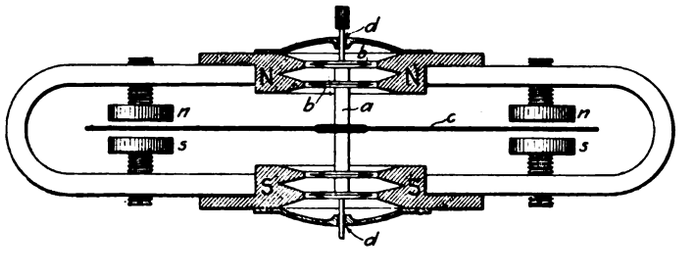

FIG. 16.—Diagram of Brake and Magnetic Suspension of Stanley Meter.

were objectionable in meters and that the greatest simplicity was got by mercury meters for direct currents and induction motor meters for alternate-currents. Mr. Evershed's meter shared one good quality with the Thomson meter—viz., it was suitable for either direct currents or for alternating of any frequency. Exceedingly small values were given for the friction which they might think very wonderful. Perhaps they were, but really the wastefulness of all meters was something terrible, when they remembered that a watt meant about 44 foot pounds per minute, and that few, if any, meters took less than one watt at the smallest load. He then sketched a diagram (Fig. 16) of the Stanley meter, which he said contained one of the most interesting magnetic suspensions so far produced, and he did not think Mr. Evershed had quite realised what a very pretty thing the Stanley suspension was. When he was in the States a couple of years ago he saw and tested the first meter made by Mr. Stanley. The shaft *a* was magnetically supported by the flux passing into the flange *b* from the encircling poles N and S, the disc *c* mounted on the shaft *a* being magnetically braked by passing through the field between the polar extensions *n s*. This method of suspension caused the shaft and disc actually to float in the air. Extensions of the shaft passed through guide holes at *d d*, but there was no pivot in the ordinary sense. It would be seen that friction could only take place at *d d* and that a fair amount of clearance in the magnetic gape, and good mechanical centreing would make this friction negligible. Mr. Stanley had told him, in fact, that some of his 6 kw. meters started with 2½ watts.

Mr. H. L. P. BOOT, as a user of meters, said he was glad to be able to have a "go" at the manufacturers, and to inform them of the difficulties he had had to contend with. In his six years' experience with different makes of meters, he had had to scrap no less than two of the types, and it had paid him to scrap them. He admired this meter immensely, but he personally preferred a meter which he could to an extent understand, so that he could alter it and adjust it, and also a meter in which there was not so much dependence upon permanent magnets. Mr. Ferranti had mentioned the fact of the meter ticking. It was also true that the Aron meter ticked; and unfortunately it was true that nearly all types of alternate current meters gave considerable trouble owing to the noise they made. He had designed a little arrangement, something in the form of a relay, which cut out the meter during the hours it was not being used. Lastly, he wished to impress upon the manufacturers of meters that rapid delivery was required.

Mr. E. SCHATTNER said he had had very little experience with motor meters. The one described by Mr. Evershed seemed very ingenious and very fine in every way, but his experience showed him that it was hardly simple enough. It also struck him that this meter could not be produced at the price which a meter nowadays ought to be produced. Since electrolytic meters had come into the market, reducing the price and being very much more simple, the tendency had been everywhere to produce a motor meter at a smaller price even at the sacrifice of accuracy.

Prof. W. E. AYRTON spoke first as to the question of complexity, and instanced the present Aron meter, the meter which, he said, was selling by thousands per year even in this country (backward as we were in electric lighting) with all its complexity, but on the other hand with all its accuracy. Compare it, he said, with the original clock which was shown in that very room 18 years ago with its single pendulum. They would have said that the original clock was the thing which would have sold in thousands, and that the present Aron meter, could it have been foreseen, would have had no chance. If they looked at Alfred the Great's candle and their watches of to-day, what chance did watches stand; they were far too complicated for anybody to buy them. If Mr. Evershed had the smallest feeling of despondency because he had obtained such marvellous results with a certain amount of complexity, he should bear up, as there was a possibility that his meter might rival, say, the Waterbury watch with its sale, and he had no doubt Mr. Evershed would then be quite satisfied. He did not know, however, what the Aron meter had to do with the Paper, which was on "A Frictionless Motor Meter." The Aron was not a motor meter, and it was not a frictionless meter. It was a meter in which the friction did not produce the error in the reading, but it was not a frictionless meter. There were other meters with various dodges, and so on, in which the friction, it was hoped, would not produce much error in the readings. The well-known starting coil in the Elihu Thomson meter, for instance; but what Mr. Evershed had tried to do and had succeeded in doing was to get a meter which did not require any of these devices and still should have a very high accuracy. He would like to know if Mr. Evershed had tested the friction of any of Mr. Ferranti's meters. Aron meters, so far as he knew, were all energy meters. In the same way Mr. Evershed had made an energy meter, but he had not introduced only one little improvement, he had taken the whole energy meter and had re-invented every single part of it, and so obtained perfection.

Mr. M. ARON confirmed Prof. Ayrton's statement that the present Aron meter was an energy meter. He would like to meet Mr. Boot on the ground of the noise of the meter, as it was rather satisfactory to know that the only objection to the meter was the slight noise. It seemed to him that a consumer who wanted an accurate measuring instrument was rather hypercritical if he was going to raise objections to the noise. For alternate currents there had been some trouble in arranging and adjusting the Aron meter, as there were so many periodicities in use, and here again the instrument made some slight noise. Mr. Evershed need not trouble himself very much about the noise of his meter, because he (the speaker) could assure him that of the thousands of Aron meters being made and sold in this country in only a very few cases was the question of noise raised.

The PRESIDENT (Prof. S. P. Thompson) wished to add to the congratulations which had been offered to Mr. Evershed on this Paper. It obviously represented a very large amount of very careful thought, of large experimenting, great care and patience, and it would be a thousand pities if work like this were lost either to the scientific world or to the world of commercial users of electricity. With regard to the criticism as to the noise, as a consumer of electricity he had a meter in his house which made ticks, and he was rather glad it was so, because going across his basement hall at the dead of night as he locked up before he went to bed, he could hear the meter ticking, and if he did not he knew something was wrong and immediately went to see how many hundred pounds it had charged against him since it was last read.

Mr. SYDNEY EVERSHED, replying to the discussion, thanked some of the speakers for their kindly references to his work. Broadly speaking, he thought the criticisms which had been made would amount to this: His meter was too complicated. He did not think he could possibly put this matter of complication better than Prof. Ayrton had done. But the question of complication was entirely a question for him and not the user. He might remind Mr. Ferranti, however, when he spoke of complicated things, that Mr. Ferranti himself was somewhat complicated, but it seemed that he worked very well, and had done for many years, and he appreciated rather than depreciated. At all events, they all appreciated him more and

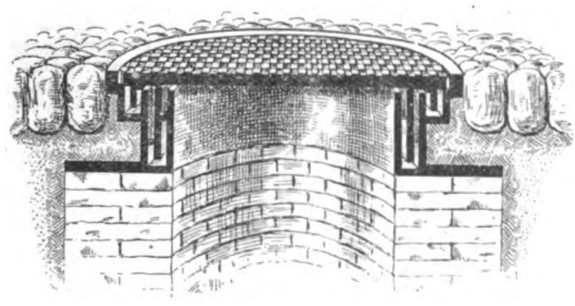
Digitized by Google

more. He was rather amused that the subject of the ticking of the meter should have been so prominent. When the meter was in its case the noise was hardly heard. The ticking was due to the lever striking metallic stops, and if rubber tubing were put over these stops they would hardly hear any noise even when the meter was out of the case. If there were any nervous persons who did not like the ticking they could have the rubber tubes. The mention of the Stanley meter, which he was glad to hear, brought him to the subject of anticipations. One never contemplated anticipation until one had worked for some time, and then, when the work was nearly finished, tried to find out what other people had done before. It was in this way that he discovered that Mr. Ferranti had, years ago, patented vario s devices for suspending the axles. He quite agreed with Mr. Ferranti that they were mostly bad. He was very glad to see the Stanley meter in the flesh. The examiner at the American Patent Office was a most benevolent gentleman. When someone applied for a patent this gentleman searched all over the world and trotted out some splendid anticipation and then sent it over saying that someone else had done the same thing before. The Stanley meter was sent over to him in this way, but he would draw attention to the fact that the Stanley meter was an induction motor meter and was only suitable for alternate currents. His opinion was that the bulk of domestic supply for the future would be by continuous currents. Mr. Boot very rightly went for the meter makers, and told them there was a great financial value in a good meter, a statement with which he quite agreed. Mr. Boot also said he preferred a meter he could alter, but he did not intend Mr. Boot or anyone else to alter *his* meter. He was going to seal it up in a case and if anything went wrong it would have to be sent back to the maker, as was the case with gas meters. Mr. Schattner had complained of complication and thought electrolytic meters appeared simpler. Personally he did not know of any electric meter more complicated than an electrolytic meter. Nothing that could be made was half so complicated as electrolysis. No chemist was yet agreed as to what was the exact process of electrolysis. As to the cost of meters, he maintained that first cost was not the last cost. There were repairs and depreciation to be taken into account. Mr. Aron also referred to the noise, and he was sorry he had not brought some of the rubber tubing he mentioned with him, as it would have saved time if he had done so.

A hearty vote of thanks was accorded Mr. Evershed at the conclusion of the discussion.

FULLER MANHOLE COVER.

The illustration below shows a new form of manhole cover made by Mr. J. W. Chisholm, of Washington, D.C. The cover forms a double water seal confining a double column of air under pressure,



and it is stated to prevent efficiently the entrance of water into the manhole without the employment of any kind of packing. The construction of the cover is fully explained by the sectional illustration.

BOOKS RECEIVED.

ELECTRICITY WORKS ACCOUNTS.

Chester Municipal Electric Supply Works.

Again this year we are able to publish excellent results in respect to the Chester undertaking. Perhaps, with the very low figures for the costs which were exhibited as the result of the working during 1898-9 it was inevitable that there should occur a slight retrogression, especially in view of the unavoidable advance in the cost of fuel, and the decrease which has taken place in the load-factor. The costs which we give in our first table this week are, however, all so low in relation to the output and load-factor that, in spite of the low price obtained, the financial results are extremely good. As compared with the output of 1898-9 the units sold during the period considered indicates an increase of over 30 per cent., while the lamp connections have advanced nearly 32 per cent. The fuel item, as usual here, is extremely low, and notwithstanding a drop in the load factor from 15·4 per cent. to 13·3 per cent. the works costs stand at quite 0·4d., and the total costs at 0·57d. below the average at the same output. We hope that it will be found possible to maintain the present excellent position in the future, though, of course, the results of the current year's working must inevitably be rather marred by the continued high prices operating in the coal trade. So far, Chester stands as a good example of the influence for economy which a high load-factor has on an electricity supply works.

Bedford Municipal Electric Supply Works.

The accounts of the Bedford undertaking for 1899 show that a splendid improvement has taken place in the position of the undertaking. Owing no doubt to the very moderate charges in force which have resulted in an average price of but 2·68d. per unit for supply and an average revenue from all sources of only 3·91d. per unit, the lamp connections exhibit the excellent advance of nearly 55 per cent., while the output has risen from 828,343 units sold to 540,146—an increase of nearly 65 per cent. Not only has the amount of the load but its character has also improved: the load-factor last year was 12 per cent., as compared with 11 per cent. in 1898.

Excluding from consideration the fuel item, the remaining generating costs and the management charges have all fallen consistently with the altered conditions. The result is that in spite of the naturally high and increased fuel charge, the works costs are normal and the total costs well under the average 1898 figures for stations of similar output. In view of the improved state of affairs and the substantial payments for the extinction of debt, the deficit of £288 is a small matter and will no doubt give place to a decided balance to the good as the result of this current year's operations.

The following is a list of electric supply works the accounts of which have been analysed, together with the dates on which statements and analyses of accounts have appeared:—

Aberdeen (Municipal)	Jan.	12, 1900	Kingston-on-Thames (Mun.)	July	10, 1900

PROJECTED COMBINED ELECTRIC SUPPLY AND TRAMWAY WORKS FOR WILLESDEN.

(*Concluded from page 524*).

ELECTRIC TRAMWAYS.

. . . The seven proposed routes are detailed, in which particulars of length and the estimated cost of the complete equipment of each is given. In none of my estimates have I made provision for the cost of any alteration or widening of streets or roads which would be traversed by these tramways. As the streets are mostly too narrow for continuous double track, I have estimated for single track with turn-outs about a quarter of a mile apart. This will permit a service of any frequency up to 2½ minutes being given, if required, at a future date. In the meantime I recommend that a 10-minute service be given. It will be desirable to run seven days a week, and I estimate each car will run 14 hours a day. The maximum speed of the cars will be at the rate of 8 miles, or including stoppages 6 miles an hour. I strongly recommend the overhead side trolley system of electrical equipment as being not only the cheapest but also the most efficient.

The machinery I have recommended you to put down at the electricity works is eminently suitable for operating electric tramcars, and the supply for this purpose would be a most valuable addition to the load on the works, as the demand continues throughout the daytime when it will be at a minimum for other purposes. The increased output from the works would very materially reduce the cost of production for all purposes, and it is evident that the same staff can be employed at the electricity works and sub-station as would be necessary if the supply were given for purposes of lighting and general motor work only. Between the electricity

supply and tramways undertakings an important fundamental difference exists. For the former purpose a large amount of capital must be expended on which the return can only be slow, since it cannot be expected that every householder will adopt electric light the moment the mains are laid. It is therefore almost impossible for an electricity supply undertaking to be immediately self-supporting. A tramway undertaking, on the other hand, will probably pay its way from the day cars commence to run. I have little doubt that not only would the short line I recommend you to construct pay its way, but, further, that it would show a profit which would go far to balance the deficiency inevitable during the first two or three years after the electricity works commence to supply the public. It would, therefore, seem judicious from every point of view to proceed with the undertakings simultaneously.

I give a detailed estimate of the cost of equipping routes 1 and 4, and an estimate of the annual cost of operating this line, together with an estimate of receipts. It will be seen that after making ample provision for repairs and maintenance, and interest and sinking fund on capital, the cost of working per car mile is 8·4d. It therefore follows that if an average of 8·4 passengers at the rate of 1d. per car mile were carried, the tramways would pay their way, while a profit would accrue to the electricity works from the supply. I have assumed that the supply would be charged at 2·5d. per unit, which would be a fair rate if the requirements for tramway purposes did not exceed 250,000 units per annum. I also indicate the profit which would be made if the receipts per car mile averaged 10d. and 11·99d. I find from the Board of Trade tramway returns that the average receipts per car mile during the last three years in the Harrow-road and Paddington tramways have been 11·99d. If this tramway, which can hardly be said to carry to important termini, earns this revenue, one traversing the heart of the Willesden district should certainly earn at least as much.

CORRESPONDENCE.

WIRELESS TELEGRAPHY.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: While making some experiments here in wireless telegraphy, using a vertical wire and general arrangement similar to that adopted by Mr. Marconi, a somewhat curious screening effect has come under observation. Experiments were first made with a tall pole to which the vertical wire was attached, and which could be carried about and held upright in any required position. Working in this way in the fields, and with a pole about 20ft. high, it was possible to get very good signals up to a distance of nearly half a mile. In these experiments the sending and receiving stations were separated by a belt of trees about 50 yards in width, but not very near either to the sending or receiving stations.

It was then decided to arrange a signalling station for experimental purposes, at a distance only very slightly greater than that experimented over in the first instance; as nearly as could be estimated the distances in the two cases were 800 yards and 900 yards respectively.

On erecting poles, however, rather over 30ft. high at the sending and receiving ends, the signals were not at all distinct, though, according to Marconi's law, this height of pole should have been sufficient to signal nearly a mile with the instruments used.

After some consideration it was decided that this want of effect must be due to the screening action of a number of lime trees (also about 30ft. high) which closely surrounded the house to which the receiving pole was fixed, the trees nearest the pole being not more than 6 yards distant. The trees, which are planted in a row approximately perpendicular to the line of transmission, would form a screen similar to the wire grids used in polarization experiments with waves of shorter length, though on a somewhat larger scale. This effect of the screening action of trees near the receiving station is the more interesting, in view of the fact that the steel ropes and masts of a ship in Marconi's experiments appeared to have very little disturbing effect. With trees, however, the interlacing branches should screen the space much more completely than the steel stays of a ship.

The earth connection (which was made to an earth plate 6ft. by 2ft. at the sending end) should have been very good at the receiving end, where connection was made with a water pipe laid in very damp soil. The nature of the earth connection has, of course, a good deal to do with the effectiveness of signalling, but it cannot account for the effects described above, since the earth was probably better in the second series of experiments than in those carried on in the field. It seems probable that the greater distance to which signalling can be carried over sea than over land with a given height of mast is due (partly, no doubt, to the complete absence of obstacles) but chiefly to the excellence of the earth connection, which can be made direct to the sea water at both ends.

It may be of interest to record here some observations that were made on the spark at the sending station with a revolving mirror. One terminal of the spark-gap, which was 1cm. in length, was attached to a vertical wire 22ft. high of 7/16 stranded wire, the other terminal being connected to the earth plate mentioned above. The light was reflected from the surface of a revolving mirror (running at about 450 revs. per sec.) on to a photographic plate, placed in an ordinary camera, which was focussed on the spark-gap. It was never possible to see more than two or three half oscillations of the spark on the plate, thus demonstrating the extremely rapid damping with this arrangement. The frequency calculated from these photographs was about 2,500,000 per sec., corresponding to a wave-length of about 130 metres.—Yours, &c. E. W. MARCHANT.

Blythwood Laboratory, Renfrew, N.B., July 30, 1900.

PARLIAMENTARY INTELLIGENCE.

MUNICIPAL TRADING.

The Joint Committee on Municipal Trading met again on July 24, the Earl of Crewe presiding.

The EARL OF MORLEY, Chairman of Committees in the House of Lords, gave evidence as to private bill procedure in the House of Lords. When the session began, he said, he went through every bill with the promoters and argued every point that arose. These interviews were entirely private, the object being to facilitate the progress of bills in both Houses and to save cost and trouble to promoters by getting the amendments he thought necessary introduced in the first House. If any important question of principle arose he consulted the Chairman of Ways and Means in the House of Commons, and if the matter was very important indeed the head of the Government department concerned sometimes came to see him. He was, of course, merely the agent of the House of Lords. The question whether corporations should be allowed to work tramways was very much discussed in 1892. The decision in favour of giving corporations the power could only be effected by an alteration of the standing orders, so that both Houses had ample notice of what was being done. When smaller matters arose, such as the manufacture of fittings for electric or gas work, he dealt with them himself. The veto on the manufacture of fittings had been inserted in private bills for the last two years. He consulted several experienced gentlemen who came before him for the promotion of bills, and they all said that they did not want power to manufacture at all. He did not quite agree with a former witness who said that it would be easy when a corporation bought up a company to cut out any power to manufacture which the company might possess. The undertaking would be purchased as a whole, and the power to manufacture would affect the terms of purchase. Witness did not regard the running of omnibuses as a fit subject of municipal trading. The local authority having control of the traffic might very much handicap any competitors. As far as he knew the power of generally using omnibuses had not been allowed. The Tramways Act of 1870 required amendment in regard to the absolute consent of local authorities being required before a tramway could be made. Local authorities, who had an absolute right to stop a bill, might stop a very useful enterprise, and had the power of imposing conditions which were very often extremely onerous. While he was all for giving local authorities every opportunity of being heard, he thought that the right of absolute veto ought to be modified. He thought it would be an advantage to have a new general Tramways Act.

The CHAIRMAN: As to electric lighting orders, we have had complaints that local authorities—particularly small ones—have obtained orders and have not used them.—I think that the Clauses Bill of 1899 embodies exactly the practice enforced by the Board of Trade up to that time. The clauses of that measure give the Board of Trade powers to revoke a provisional order after a certain time, but I fancy that that power has, so far, been very sparingly used. I think it would be far better that there should be a limit of time put on the completion of the works, and that if at the end of that time the local authority seeks power to extend the period, it should be extended. I do not think that it should go on indefinitely.

Sir ROBERT HUNTER, solicitor to the Post Office, explained the legal position of the Post Office with regard to the National Telephone Co. with reference to the opening of streets in Glasgow. In 1892 an agreement was made between the Postmaster-General and the National Tele-

Digitized by Google

phone Co., to the effect that the trunk wires connecting different towns should be worked by the Postmaster-General, and that business inside towns should be left in the hands of private companies. The Postmaster-General also agreed that he would confer on the National Telephone Co. the powers he possessed of taking up streets under an act of 1892, and also that he would lay pipes for the Telephone Company to connect two or more exchanges in the same area. He did not think the Glasgow Corporation had any particular grievance with regard to the arrangement between the Post Office and the company.

Mr. J. W. BENN, L.C.C., said that of the 115 miles of tramways in London 72 miles had already been purchased by the County Council, leaving 43 still in the hands of private companies; 48 miles were leased by the Council to the North Metropolitan Tramways Co., and 24 miles south of the Thames were worked by the Council itself. The northern lines cost £817,000 and the southern £889,433. The net receipts from the northern lines were £75,777, and the surplus, after deducting charge for interest on capital and sinking fund, was £38,111. On the south side the net receipts were £92,991, and deducting charges for interest and sinking fund, there was a surplus of £48,283. Regarding the matter as an investment for the ratepayers, the Council had been able to pay the same percentage to the investors in the south as in the north and out of the southern surplus to make several very valuable concessions to the passengers and to those employed on the tramways. The Council had set up an all-night service practically without regard to whether it would pay. This service had proved extremely popular and had paid its way. There was a much more frequent service of cars in the south than in the north. The Council's charge per passenger came to 0·89d. against 0·94d. charged by the company formerly owning the southern lines. That meant a difference in passenger receipts of £17,000 a year. The charge per passenger in the north was 1·12d. against the southern charge of 0·89d. As to whether a local authority could work a tramway as cheaply as a company, he had compared the working of the southern lines by the company in 1898 with the County Council working in 1899, and found that under the company the total receipts were £414,922, the total expenses £335,958, and the balance of revenue £104,964, while under the Council the total receipts were £467,180, the total expenses £383,030, and the balance of revenue £84,150. That showed an apparent loss, but against the loss must be charged £14,000 for the provision of better wages and a six days' working week for the employées, and the fact that the Council set aside for repairs and renewals £8,392 more than did the company. Thus the actual working showed a balance in favour of the Council of £1,578. The Council hoped for very important results from the adoption of electric traction. They expected an extra profit resulting from the conversion of the motive power of 3·38d. Assuming that only as many miles as at present would be run, that would show an addition to revenue on the south side of £140,633. Deducting the interest on the extra capital and the sinking fund, this meant an extra annual profit on the 24 miles of £79,008.

On July 27 Mr. G. BRIGGS, managing director of the Shap Granite Co., Westmorland, and representing a number of manufacturers of concrete slabs, protested against the way in which certain Corporations were competing with such manufacturers by means of paving material made out of the refuse from destructors. Some of the Corporations were selling the slabs at a loss of 25 per cent., that was to say, at 25 per cent. under that which it would cost a private manufacturer to produce them. This was the case in Aston Manor and Bootle. From this loss had to be deducted the 9d. a ton which it would cost the corporations to get rid of the refuse.

Mr. MAXWELL, president of the Scottish Co-operative Wholesale Society (Ltd.), Glasgow, expressed his satisfaction with the manner in which Glasgow Corporation had conducted its various undertakings Under company proprietorship gas was 4s. 7d. per 1,000ft., and to-day was 2s. 2d., while the quality was better. The conditions of labour had also greatly improved under the management of the Corporation. The wages of the tramway men had been increased by from 4s. to 5s. per week, and the service had been greatly improved. He would like to see the municipal system further developed. He thought that all cemeteries should be in the hands of local authorities, and suggested that Corporations should start fire insurance and life insurance businesses. He did not see what was to hinder corporations going into banking, and he thought that the issue by corporations of notes for very small amounts should at least be tried.

Mr. W. E. L. GAINE, general manager and solicitor of the National Telephone Co., said he wished to reply to evidence given by the Lord Provost of Glasgow with reference to the Glasgow telephone service. The Lord Provost had stated that the real reason why the Corporation obtained a telephone licence was that the company's service was inefficient. A report on the subject was, however, made by a Treasury Commissioner, the Sheriff of Perthshire, after a long inquiry, in 1897, and his decision was that the inefficiency of the company's service in Glasgow was largely due to the action of the Corporation in refusing to grant the company wayleaves for putting down the metallic-circuit underground system. The inference which the Treasury Commissioner drew from the evidence placed before him was that the true cause of the refusal of the Corporation to allow the company wayleaves was that they were resolved to establish a telephone system of their own by which they believed they would be able to extinguish the company so far as Glasgow was concerned, and to establish a cheaper and better service. The Commissioner also expressed the opinion that as the telephone was used only by certain classes of the community and not by all it was not a proper subject for municipal enterprise. It was pretty clear that men living in houses of an annual value of under £20 would not be likely to use the telephone, and in Glasgow 85 per cent. of the whole of the ratepayers were assessed at less than £20. Witness did not think that in the case of the telephone service competition was right or proper. The telephone service was part of the telegraph service of the State, and ought to be in the hands of the State. If it were not in the hands of the State it ought, like a great railway, to be a monopoly under the control of Parliament, otherwise the multiplying system of different local areas worked under different regulations would cause great trouble. He did not think that more than two or three municipalities in this country, with the exception of Glasgow, had thought it wise even to consider the adoption of a telephone system.

The CHAIRMAN: You say that it was by harassing you in Glasgow that the Corporation put you into a position which enabled them to obtain powers from the Postmaster-General. Do you think that is likely to happen elsewhere?—Yes, it may happen elsewhere.

Can you tell me if competition is allowed in foreign countries?—There is no competition in France or Germany, and none anywhere in Europe, except in Sweden. In the case of Sweden there is competition in Stockholm, and that is between a great company, which does the bulk of the work of the State itself. In America the position is quite different. There the telephone interest is dominated by one great finance corporation, and they have licensed a large number of different companies to exploit the various States one after another. There is a certain amount of competition there. There is much greater freedom in America for anybody to set up systems than in this country or in any European country.

Even in the powers of taking up streets?—Yes.

The sitting then closed, and it is believed that no further evidence will be taken.

SOUTH WALES ELECTRIC POWER DISTRIBUTION BILL.

On July 28 the House of Lords Committee, presided over by the Duke of Argyle, considered this bill.

Mr. PEMBER, Q.C., for the promoters, said the opposition had now gone down to something very small. A clause was put in by the House of Commons Committee providing for compensation to the Swansea Gas Light Co. and the Aberdare and Aberaman Gas Consumers Co., but it was struck out by the Government draughtsman and the Board of Trade. He was, however, quite willing that it should be re-instated if counsel for the two companies mentioned could convince their lordships that it was necessary.

The Committee agreed that a protecting clause for the two gas companies should be put in the bill. The preamble was then declared proved, and the bill was ordered to be reported for third reading.

LONDON COUNTY TRAMWAYS (NO. 1) BILL.

On July 24, the Select Committee of the House of Lords, of which the Earl of Camperdown is chairman, commenced consideration of this bill. The House of Commons proceedings were fully reported in our issue for June 22 and 29.

Mr. FREEMAN, Q.C., for the promoters (the London County Council), said the object of the bill was to enable the Council to link up the various systems of tramway in the Metropolis which had been constructed by various companys, and to reconstruct particular tramways. The form of the bill had been agreed with nearly all the local authorities; and 11 out of the 15 tramways proposed had been put in the bill at the urgent request of the local authorities themselves. He submitted that the general question of allowing tramways had been decided by the general Act of 1870; and he should contend that petitioners against a tramway must allege and prove specific injury and inconvenience. The opposition of the frontagers and of the railway companies affected by this bill was purely a matter of clauses.

The CHAIRMAN said none of the petitioners, as far as he was aware, opposed the bill as a whole. In that case the most convenient way would be to allow the bill to proceed and then deal with the opponents on clauses, as suggested by counsel. The Committee accordingly declared the bill.

The consideration of clauses proceeded, and evidence having been given as to Tramway No. 4 (St. James's-road, Holloway—Drayton Park-road—Gillespie-road—Blackstock-road), the CHAIRMAN said the Committee had decided to strike this line out of the bill.

The proposed line along St. John-street-road, from the Angel at Islington to Smithfield Markets, was then dealt with.

Mr. FREEMAN said this line would be double all the way. St. John-street was wide all its length except at one place, and that the County Council were taking powers to widen.

The evidence of frontagers objecting to the line was taken, the opposition being to the block of market traffic likely to arise from the tramway.

The Committee then considered the proposed line along Rosebery-avenue.

Mr. COURTHOPE MUNROE, for the Holborn District Board of Works, pointed out that the London County Council, at the instance of the Clerkenwell Vestry, agreed to carry out in Clerkenwell parish, about half a mile away from Rosebery Avenue, an improvement which was more local than general in its character, which would cost some £200,000, but they made it a condition that the Clerkenwell Vestry should consent to the line along Rosebery Avenue. He contended that that was an improper bargain, especially having regard to the fact that in 1897 and 1898, when a similar scheme was before them, the Vestry felt they could not, in the public interest, consent to the line being made.

The CHAIRMAN said the Committee could not discuss the motives of Clerkenwell.

Mr. MATTHEW HALE, clerk to the Holborn District Board, said there were six lines of trams and 10 lines of 'busses converging at the Holborn Town Hall, where the new line would join the existing lines, the traffic otherwise was very heavy.

Mr. FREEMAN, in reply for the County Council, pointed out that there were only 200 yards of the Rosebery Avenue line in the Holborn district and when made it would allow ample room for carts and waggons to pass. The matter of congestion was simply one for the police to deal with.

The Committee decided eventually to retain in the bill both the Rosebery Avenue and St. John-street-road tramways, and the bill was ordered to be reported.

LANCASHIRE ELECTRIC POWER BILL.

This bill came before the Duke of Argyle's Committee of the House of Lords on July 26. The House of Commons Committee proceedings and a sketch map of the area of electricity supply embraced by the bill have been given in previous issues of *The Electrician*. Opposition to the bill proceeded from the local authorities of Liverpool, Bootle, Bolton, Manchester, Salford, Southport, and Stockport, who wished to be cut out of the bill because they objected to the promoters of the bill having wayleaves empowering them to lay wires through their districts.

Mr. WORSLEY TAYLOR, Q.C., for the promoters, said it was necessary this wayleave power should be given in order that the company to be incorporated under the bill might supply electricity to places on each side of the opposing districts. It might not be necessary to put the cables through the principal parts of those opposing districts, but only through some parts of them. The opposing corporations objected that they were themselves sudplying electric current, and therefore that they did not require to be supplied by this company. He urged although that might be the case at present it did not follow that they would not require to be supplied "in bulk" at any future time. Therefore he could not understand the opposition. Blackburn had its own electricity works, but did not stand in the way of this company. But Manchester not only objected to the promoters laying cables through their streets, but also objected to cables being laid through the roads and streets of neighbouring authorities.

Mr. GRIPPER thought the scheme of the promoters an excellent one. There were 129 local authorities in Lancashire, and 16 or 18 of them had already electric works in operation; 19 had obtained provisional orders, but had not yet constructed any works, although some of them had had their orders for 10 years; in 87 districts no attempt had been made to obtain provisional orders. Many of the local authorities would be only too glad to do their own lighting if they could get supply in bulk from the promoters of this bill, as then they would only have to spend their money for laying down mains. He did not consider Manchester was at present in a position to supply the outlying parishes as advantageously as this company hoped to do, although they might be when they had finished the extension works they were now carrying out. The promoters wanted to supply current at 1d. per unit. He was not aware that Liverpool supplied it at less than 1d., but probably Manchester was able to supply current for tramway working at less than 1d. Shown some photographs of trenches which were dug in Manchester streets for laying cables, witness said his company would not dig trenches like that; they were more like earthquakes than anything else. His company could lay all their cables in the space Manchester was wasting. They wanted power to go through Salford in case they were asked to supply districts on the other side. He was not aware that Salford supplied the tramways with electricity at ¾d. but even that was not an unusual price for tramways. If Liverpool cannot supply electricity for street lighting at less than 2½d. they would possibly require his company's supply, because it would be cheaper. He did not think it would be necessary to run cables through Stockport, but Stockport might want his company's supply at some future time, as might also Southport. They would enter into a contract with Southport to-morrow to supply them at 50 per cent. less than they supplied themselves. He had before him a list of 66 local authorities who were supplying themselves with electricity, but not six places were supplying electricity as cheaply as Southport. He was certain his company could compete with Southport, even though their cable would have to go a long distance.

Mr. WORSLEY TAYLOR, in reply to the Chairman, said that if Bolton and the other towns were struck out of the bill the promoters would not have power to supply them with electric current if they eventually wanted it, as they would not have statutory rights to spend their money for the purpose.

Evidence in favour of the bill was given by, amongst others, Mr. Arthur H. Leach, chairman of the West Houghton District Council.

Mr. SCULLY, chairman of the Electricity committee of the Gorton District Council, said his Council had a provisional order of their own, but had not constructed any works. They had now three alternatives: They could put down their own works, or could arrange with Manchester, or could arrange with this company if the bill was passed. His Council desired that Gorton should remain in the area of the bill, and it would possibly be to their advantage to take electricity in bulk from the company. At all events, they would like to have the opportunity of doing so.

The Committee decided that Liverpool, Bootle, Manchester, Salford and Stockport should be exempt from the area of the bill; that wayleaves be granted in the case of districts which had entered into contracts with Manchester; and, in regard to Bolton, that wayleaves be granted up to within a radius of 2½ miles of the town hall.

On July 26th, Mr. BALFOUR BROWNE, Q.C., asked the Committee to reconsider their decision with regard to Southport. He said the Corporation were unanimously in favour of being left out of the bill, as they had their own electricity works, and could supply themselves with current more cheaply than it could be supplied by this company.

The CHAIRMAN said the Committee had considered the matter, but would not change its decision, as above set out.

SHANNON WATER AND ELECTRIC POWER BILL.

On July 28 this bill was before the House of Lords Committee presided over by the Duke of Argyle. A full report of the proceedings before the House of Commons Committee appeared in *The Electrician* for July 6, p. 411, and a sketch map of the proposed area of water collection and electricity supply was published in our issue of July 13.

Mr. BUSHE, Q.C., for the promoters, said the opposition was of a very restrictive character, and was offered by a few fishery proprietors along some 5 miles or 6 miles of the river. Of course they were entitled to be heard, but he thought their opposition would have no weight with the Committee. They stated that they had valuable spawning beds in the river, and that the scheme of the promoters would do those spawning beds injury. But anyone who knew Ireland was aware that of whatever else they might fall short it was not rain. What was proposed by the bill had been done extensively in America, Italy, Switzerland, and Germany, and it had been a great source of wealth and advantage to the districts served. The promotion of the bill gave a good sign of awakening enterprise in Ireland. They proposed to supply electricity for lighting and all other purposes to Limerick and other places within a radius of 30 miles of their works. The project had received support of 24 local bodies and three county councils.

Mr. S. G. FRASER, engineer to the project, repeated his evidence before the Commons Committee, and added that the Shannon Company's working expenses might be estimated at £2. 16s. per H.P. per annum. Labour was very cheap in that part of the country. The purchase of land and the cost of the works would carry an expenditure of £183,000.

Mr. H. F. PARSHALL said the chief necessity in connection with electric lighting was economy, especially in Ireland. He estimated that the cost of the production of electric current would be 1d. per unit. At Cork electricity was generated by the electric company there working by means of coal, and it was very expensive.

The CHAIRMAN said the Committee regretted that the scheme seemed to them at present incomplete for the purpose assigned, inasmuch as the promoters would have to come to Parliament again for the conclusion of the project (the question of erecting a weir on the river which had not been mentioned in this bill), but they were ready to hear counsel for the promoters on that point.

On Saturday Mr. BUSHE said that, having regard to the very serious consequences which might ensue if the Committee's view was adhered to, he would like to put before the Committee the views of the promoters. There was an understanding that a case should be presented in a complete form, but he contended that this was a case to which such a rule was never intended to apply. The case was complete, and the provision of a weir was a subsidiary question. He therefore asked the Committee to hear the evidence of his witnesses. If that evidence satisfied the Committee that it was a complete scheme, then the promoters could come to Parliament next year to ask for what was a very small thing, because all the big issues of the case would have been decided. The weir was not for the promoters' satisfaction, but for the satisfaction of the opposition, and also the Board of Works, who had asked for a weir.

Mr. BALFOUR BROWNE said the promoters knew they could not expend one penny until they got water, and they could not get water until they constructed the weir, which showed that the scheme was incomplete. This scheme, if allowed, would kill the salmon fisheries.

Mr. FRASER, recalled, said he saw no reason why they could not make their intake at such a height that they could not get water until the river was above a certain level.

Mr. HASSARD, recalled, said the promoters could get sufficient water for their purpose and still leave sufficient for fishing purposes.

Mr. BALFOUR BROWNE said his clients would oppose this scheme to the bitter end unless the promoters carried out their contracts. He had expert witnesses who said there was no means of measuring the water except with a weir.

Mr. ARMISTEAD, manager of the Solway Hatchery and Salmon Fisheries Co., said deep water was not necessary to enable salmon to spawn; a foot or two would be ample. There were not many spawning beds between the proposed intake and outlet, nor would this scheme injure the salmon fisheries.

Mr. A. L. JOYNT, director of the Limerick Electric Tramway Co., said he was sure the promoters of this bill would find plenty of customers for their electricity in Limerick. The whole of the local bodies in the district, numbering 23, had passed resolutions in favour of the scheme.

Mr. QUINN, a member of a large manufacturing firm in Limerick, said the promoters' scheme would be of great advantage to his own firm if they supplied electric power at a low rate, and it would be the means of many more industries springing up in Limerick.

Mr. BROWN, chairman of the promoting company, and a member of the firm of Brown, Thomas & Co., of Dublin, said he had been watching the Shannon running to waste for years, and he had often wondered what could be done with it.

Other evidence for and against the scheme having been tendered, chiefly in the latter case, to the effect that the passing of the bill would ruin the salmon fisheries and take away the livelihood of the fishermen and their families,

The Committee stopped further evidence, and the Chairman announced that the preamble of the bill was not proved, and it could not be proceeded with.

BATLEY CORPORATION TRAMWAYS BILLS.

This bill, a measure to confirm a provisional order, came on June 27 before the Select Committee of the House of Lords, presided over by the Duke of Northumberland.

Mr. FITZGERALD, Q.C., said the bill sought to confirm a provisional order authorising the Batley Corporation to construct an electric tramway within the borough. The population of Batley had doubled since the charter was granted in 1868. There was an existing tramway worked by steam, and this the Corporation would, in time, be able to acquire. The scheme now proposed would complete the tramway system. The opponents of the bill were the British Electric Traction Co., who had promoted a measure before the Light Railway Commissioners called the Spen Valley Railway, and since the Batley Corporation had started proceedings to obtain the present bill, the company had brought forward another scheme to get their Spen Valley railway. He also pointed out that under the general law relating to tramways it was customary to give local authorities power to

Digitized by Google

work tramways within their districts when they were so disposed. In this case it was specially desirable such powers should be granted as they were the lighting and water authority; and if entrusted with the tramways would have the whole control of the breaking up of the streets and roads.

Mr. J. ILLINGWORTH, Mayor of Batley, said there were a large number of manufactories in the town. On the north, east, and west sides of the town there were districts without a tram service at all, and in the best interests of the public it was desirable that these districts should be furnished with means of communication by tramway. The Corporation were unanimously in favour of an electric tramway system, considering that such a system would tend to its development, and would benefit the inhabitants who favoured the scheme. The Corporation proposed to work the tramways in connection with the electric lighting, for which they had already obtained an order. The present bill was first formulated about a year ago—before the Spen Valley scheme was put forward. The Corporation were prepared to help that scheme outside their own boundaries by giving running powers over their own line. The cost of the Corporation tramway, with the generating station for electric lighting and tramways, would be £100,000. Working powers to be given to the Spen Valley Railway would be subject to arbitration under the bill.

Mr. G. HIRST, manufacturer, chairman of the Electric Lighting and Tramways committee of the Batley Town Council, also gave evidence in favour of the bill. The Corporation obtained electric lighting powers in 1898, and shortly afterwards a committee was formed to report on a scheme for electric lighting and tramways. It was subsequent to that that notice was received of the Spen Valley scheme. Engineers engaged by Batley Corporation had reported before August last.

Mr. S. V. CLIREHUGH (Messrs. Lacey, Clirehugh & Sillar) said his firm were first instructed in January, 1899, to report on the question of an electric lighting scheme for Batley, and also to report briefly as to the possibility of a tramway scheme. It was not until March 11, 1899, that they received formal instructions to give a full detailed report and estimates with regard to tramways, but in January, 1899, he had visited Batley, and, in his own mind, formulated routes. When he made the report to the Corporation he had no idea of the existence of the Spen Valley scheme or of the route of that scheme. It was perfectly clear to anyone acquainted with Batley that Halifax-road was one of the most obvious routes in the borough for a tramway. Provision was made in clause 40 of the Corporation's order giving the Spen Valley promoters the right to run over the tramway in the Halifax-road; and there would be no difficulty in doing that. His estimate for the whole work, excluding the generating station, was £107,000.

Mr. STEPHEN SELLON, for the opposition, said he was engineer to the Spen Valley scheme of the British Electric Traction Co. The scheme started from Dewsbury, and its main line ran through Heckmondwike, Gomersal, and Cleckheaton, passing through a small portion of Batley (Halifax-road). When the scheme was brought forward a local inquiry was held by the Light Railway Commissioners, at which the three towns mentioned propounded a rival scheme. But in consequence of the difference of opinion among the corporations it was held advisable to put the scheme into the hands of one company. Since then the three corporations had entered into agreements with the company and were now supporting them. The line as it passed through Batley would adequately serve that town. The Batley scheme was very small compared with the Spen Valley scheme, and if it were sanctioned the traffic on the much larger system would have to be dependent on the Corporation as to running powers. If the Corporation's scheme were sanctioned at all the line in Halifax-road should be given to the company and the Corporation given running powers over it. He regarded the Corporation tramways rather as a counter move to the company's proposal.

Mr. SYDNEY MORSE said he was solicitor to the British Electric Traction Co., and acted for them in the promotion of the Spen Valley order. The local authorities of Dewsbury, Heckmondwike, Cleckheaton, Liversedge, Gomersal, and Ravensthorpe were all favourable to the company's scheme, and at the local inquiry said the powers should be in the hands of the company and not in those of the Corporation.

Mr. FREEMAN, Q.C., for the opponents, pointed out that for the sake of a small section of about 2 furlongs in the borough Batley sought to be entitled to interfere with a line originally 8½ miles, and now, with extensions, 40 miles long. Moreover, they sought to have priority of service, and thus might derange the traffic on the whole line. He contended it was not right the power should be given, but that the company should have thorough control of their own lines. They should be empowered to make the disputed portion of line, and if the Corporation made the other parts of their proposed system they should be given running powers over the disputed portion.

Mr. FITZGERALD, Q.C., having replied,

The CHAIRMAN said: The Committee find that the preamble is proved, but they think that sub-section 4 of clause 40 should be modified so as to make it quite clear that the Corporation shall not be able to impede unduly the exercise of the company's rights over the line.

On July 30 the Batley bill came before the Select Committee of the House of Commons, presided over by Mr. Seale-Hayne.

Mr. J. D. FITZGERALD, Q.C., for the Corporation, said the only opponents of the bill were the British Electric Traction Co., who had a large capital, head offices in London, and owned tramways and light railways in different parts of the country. Their connection with this district arose in this way: In November, 1898, they gave notice of an application to the Light Railway Commissioners for leave to construct a light railway called the Spen Valley Light Railway, some 8 miles in length, which differed very little from the tramways to be constructed under the present order. The Batley Corporation opposed that scheme, which was, however, sanctioned by the Light Railway Commissioners, but had not up to the present received the sanction of the Board of Trade. The B. E. T. Co. opposed the Batley Corporation scheme on the ground that the Railway Commissioners had sanctioned the Spen Valley scheme, and that they were about to ask for authority to carry out another scheme which would run across Batley. When the matter came before the Board of Trade they had the whole case before them—the application of the Batley Corporation, the order already sanctioned by the Light Railway Commissioners, and a very full statement by the B. E. T. Co. The Board of Trade, however, sanctioned the Batley Corporation tramways in the order now before the Committee. After the order was granted to Batley for a tramway along the Halifax-road the B. E. T. Co. was given powers to run over the line and to make junctions with it, and in the House of Lords words were inserted binding the Corporation not to exercise their rights as owners of the tramway so as to interfere or impede the company in the exercise of such rights. While the present bill was pending in Parliament the company went on with their new railway scheme, which included the making of a line identical with one of the Corporation tramways. That matter came before the Light Railway Commissioners, who took the view that, as opposition to the Batley scheme was pending, they ought to make an order by which, if the Batley scheme were confirmed by Parliament, then the light railway was not to be made by the B. E. T. Co. The Board of Trade had sanctioned the tramways, the House of Lords had passed the bill confirming the order of the Board of Trade, and he now asked the Committee to do the same.

Mr. FREEMAN, Q.C., for the B. E. T. Co., said the Batley Corporation had no feeling of hostility, as he understood it, to the Spen Valley scheme, and the Spen Valley promoters had no hostility either. What they wanted was to be able to carry their traffic continuously along as far as Ravensthorpe. If the present order was passed, the company would only have running powers over the Corporation tramway, the result of which would be they would not be able to make through running with their electric current over that bit. Their current would be cut off over a piece of the line—the Halifax-road, which was wide enough for both to lay their lines independently. At the point where there was a short gap between the systems the company were willing to couple up the lines and not to construct the line running parallel to the Corporation's.

Mr. FITZGERALD said he could not agree. The result of placing two independent lines on the same road would be that all the traffic going one way on each set of lines would be on the wrong side of the road.

The CHAIRMAN said what the Committee had to decide was whether the scheme ought to pass or no. It had been before the Board of Trade, and when the Committee had determined what had been referred to them the Board of Trade might deal with the Traction Company as they liked.

Mr. FREEMAN said the Corporation were asking to construct a line down the middle of the road, and if that were sanctioned the Board of Trade could not allow the company to put down another line.

The CHAIRMAN said the Committee might decide that the line should be laid down so as to leave room for a second line.

Mr. FREEMAN asked that Batley Corporation should not be allowed to close this road to the company's line.

Mr. FITZGERALD said the Board of Trade had decided in favour of the Batley scheme, subject to the running powers of the Spen Valley promoters (the B. E. T. Co.), who were now asking the Committee to override the decision of the Board of Trade.

The Committee decided to pass the preamble in regard to the Batley order, subject to the insertion of a clause providing that a double line could at a future date be laid down the Halifax-road, the user of which was to be regulated by the Board of Trade.

A clause to give effect to this decision having been submitted by Mr. Freeman, was approved, and the remaining clauses were disposed of and the order set down for report.

WARRINGTON CORPORATION TRAMWAYS.

The Select Committee of the House of Commons, presided over by Mr. Seale-Hayne, on Monday considered Provisional Orders (No. 4) Bill which confirms the order granted by the Board of Trade to the Warrington Corporation empowering them to construct and work about 7 miles of electric tramways within the borough at an estimated cost of £95,577. The bill has passed the Upper House.

Mr. WEDDERBURN, Q.C., said the only opponents were the London & North Western Railway Co. The point involved was who should pay for the construction of a bridge to replace a level crossing at Wilderspool Causeway, should the Board of Trade, owing to the making of the proposed tramways, decide to order a bridge to be built. Under the company's own act the Board of Trade might make such an order at any time, and the company would have to bear the whole cost. The Committee of the House of Lords had put in a provision that, if a bridge should be ordered by the Board of Trade the Corporation should construct the road over the railway and that that company should pay to the Corporation half the cost. This road was one down which there was at present a large daily traffic, and the proposed tramway would not, he urged, add very appreciably to the traffic.

The CHAIRMAN said that in the Southport and Lytham tramroads case the same point arose, and an argument that then had great weight with the Committee was that the road was an old one and there first, and therefore the Committee decided that the greater part, if not the whole of the cost, ought to be paid by the new comer.

During the proceedings the CHAIRMAN intimated that if the opposition were persisted in, in face of their Act of 1851, under which the company could be called upon to build a bridge over this crossing at any time by the Board of Trade, and at their own cost, the Committee could not be bound by the decision of the House of Lords Committee.

Mr. LITTLER said he would not press the matter further, but he had no doubt the Board of Trade would compel the railway company to have a bridge directly this tramway was constructed.

The Committee passed the preamble of the bill in respect of the Warrington order.

GARSTON TRAMWAYS.

The Select Committee of the House of Commons presided over by Mr. Seale-Hayne, on Monday dealt with the Garston tramways provisional der.

Mr. WEDDERBURN, Q.C., said Garston was a residential suburb of Liverpool with a considerable population. Under the order the Garston & District Tramways Co. were to have power, with the consent of the District Council, to construct the proposed tramways, about 2 miles in length, at an estimated cost of £12,435. After construction the company were to sell the lines to the Council, and the Council would then lease them to the company for 21 years at a rental of £300 a year. When the order came before the Committee of the House of Lords there was a petition of the County Council of Lancashire, asking that their contribution in respect of the upkeep of the roads over which these tramways would pass should be reduced to the extent of the amount receivable by the Garston Council from the Tramways Company. The House of Lords inserted a clause reducing by £300 the contribution of the County Council for a period of 21 years. It was now sought by the District Council to have this clause taken out.

Mr. LITTLER, Q.C., for Garston Council, contended that the £300 to be paid by the company was not in respect of increased traffic on the roads.

The Committee decided that the £300 was in the nature of a rent under the agreement between the Garston Council and the Tramways Company, and the clause was accordingly struck out of the order, which, as amended, was approved by the Committee.

SOUTHAMPTON CORPORATION TRAMWAYS.

The Select Committee of the House of Commons, presided over by Mr. Seale-Hayne, on Tuesday considered the bill confirming the provisional order granted by the Board of Trade to the Southampton Corporation authorising the construction of additional tramways in the Borough, and borrowing £100,000 for the purpose.

Mr. FREEMAN, Q.C., said the bill would enable the Corporation to reconstruct certain tramways they had acquired from the former tramways company, and to construct new lines—about 8 miles of new lines—all to be worked by electricity.

There was no opposition, and the Committee passed the order.

NORTH METROPOLITAN ELECTRIC POWER SUPPLY BILL.

This bill came before the House of Lords Committee (the Duke of Argyll in the chair), when it was announced that an arrangement had been come to with the opposition. After formal evidence the committee declared the preamble proved, and the bill will proceed.

LEGAL INTELLIGENCE.

Castner-Kellner Alkali Co. (Ltd.) v. Commercial Development Corporation (Ltd.).

On Monday, the House of Lords, consisting of the Lord Chancellor (Lord Halsbury) and Lords Macnaghten, Morris, Shand and Brampton, gave judgment in this case, which was argued before them on May 15, 17, and 21. A full report of the arguments before their lordships appeared in *The Electrician* for May 18 (pp. 142-145) and May 25 (pp. 170-172).

It was an appeal by the plaintiffs from an order of the Court of Appeal discharging a judgment of Mr. Justice Bigham. The action was brought for the purpose of restraining, by injunction, the Commercial Development Corporation from infringing plaintiffs' patent, No. 20,259 (1894). The defendants denied infringement and alleged that plaintiffs' patent was invalid on the ground that the invention was neither new, useful nor subject matter for letters patent; and also that the complete specification described and claimed inventions not comprised within the scope of the provisional specification. Mr. Justice Bigham decided in favour of the plaintiffs, and granted a perpetual injunction. By a majority the Court of Appeal reversed that decision. The plaintiffs now appealed.

JUDGMENT.

The LORD CHANCELLOR, in moving that the appeal be dismissed with costs, said: In order to appreciate the real nature of the dispute in this case, one has to remember that no chemical discovery is in question, no new mode of producing caustic soda, so far as the electrolysis itself is concerned. The turning of common salt and water by electricity, and making an amalgam with mercury and sodium, so as leave as a product caustic soda, is common to all the patents that have been brought before your lordships' notice in the course of this discussion. Between the immediate parties to this appeal, therefore, there is nothing whatever in dispute, except the mechanical machinery—the apparatus by which this chemical process of producing caustic soda can be put in operation. Now, Kellner, whose patent is the one we have had to consider, described in his provisional specification the mechanical contrivance by which the process I have referred to has to be put into operation, and the whole point in dispute is whether, in the description he has given in his provisional specification, he has or has not described the invention which he claims in his complete specification, or whether the latter does not, in addition to what he has described in the former, claim something different and outside his original claim. That is the whole question. Now there cannot be any doubt that an essential feature of his invention is what he has called a stationary mercury cathode, and the question is further narrowed to the single point, in what sense the word "stationary" is to be understood. It is said that there are two senses in which the words "stationary" may have been used. It may be considered "stationary" in respect of surrounding objects or "stationary" in respect of the vessel which contains the mercury. A scientific demonstration was made before your lordships that the mercury in the vessel was itself at rest, although the vessel itself was subjected to a considerable movement. I have some doubt whether that experiment is a sufficient proof of the proposition it was intended to support. No actual use of the apparatus has ever been made, and an experiment such as was made before your lordships and its actual use in practice is a very different thing; but independent of this consideration, the question must be determined by the fair construction of the provisional specification itself. It will not do to say that in looking at the specification there is a sense in which it is compatible with the provisional, but whether the provisional really is intended to protect the invention more minutely described afterwards in the compiete specification. My lords, I am unable to say that I think the provisional specification here ever contemplated the movement in any sense of the mercurial cathode. It is impossible to read the concluding part of the provisional specification without being struck by the absence of any hint of the arrangement claimed afterwards. These are the words:—

> "If the bells, after a suitable interval of time, be shifted back into the position shown in full lines, i.e., to the right hand, the mercury on the left-hand side of the anodes, together with the amalgam formed thereon, again becomes situated in the combining chamber of the trough, and consequently within the sphere of action of the water in such chamber, whilst, on the other hand, the mercury situated on the right-hand side of the anodes, and the amalgam portion of which has been acted upon in the meantime by water to remove the sodium therefrom, becomes again situated in the decomposing chambers for the purpose of forming fresh amalgam. It will thus be seen that by the to-and-fro movement of the bells the transposition of the amalgam formed in the decomposing chambers to the combining chamber, and the practically continuous formation of caustic soda in the latter, are caused to take place alternately on the one side and on the other side of the anodes, whilst the mercury cathode itself remains at rest."

My lords, it may be true that the mercury itself is a cathode, and not the vessel in which it is contained, but this a desciption of a mere mechanical appliance and I cannot doubt that when this description was given the thing which was meant to be at rest was the mercury and the vessel containing it, and I have come to the same conclusion as the Master of the Rolls (Lord Lindley) that the Claim 3 and the Figs. 7 and 8 to which it refers are an entire departure from the essential features of the invention as originally described. Indeed, I look upon the language of the complete specification as an ingenious effort to avoid what would be a glaring disconformity, and which has received the assent of Mr. Justice Bigham and that of Lord Justice Vaughan Williams; but, as I have said, I think one must look at the provisional specification and then consider whether it is really describing what is now claimed or what is in its essential features a different thing. I think it is, and for this reason I think the judgment of the Court of Appeal was right and ought to be affirmed.

Lord MACNAGHTEN: I am of the same opinion. This case comes before your lordships under somewhat peculiar circumstances. The appellants, who were the plaintiffs in the action, charged the defendants with infringement. The appellants' patent has never been put into practice at all. The defendants' patent has never been used commercially. The rival inventions are therefore little more than paper inventions. That being so, it is certainly not surprising to find that expert witnesses are by no means agreed as to what would happen in actual working. But it may be assumed for the purposes of this case that the defendants' patent, if it should be worked on an industrial scale, would be an infringement of the plaintiffs' patent. The defendants, however, say that, assuming their invention to be an infringement of the plaintiffs' invention, the plaintiffs' patent is bad for disconformity, and that seems to be the substantial question between the parties. It depends upon a very narrow point, namely, the construction your lordships should put upon the meaning of the expression, "stationary mercury cathode." That is the thing upon which the provisional specification insists, and it is the gist of the invention therein described. Now, notwithstanding the very ingenious argument of Mr. Fletcher Moulton and Mr. Bousfield, I am not satisfied that a revolving mercury cathode is a stationary mercury cathode provided the mercury within the vessel containing it is not shaken at all or only slightly shaken by the rotary motion to which it is subjected. Speaking for myself, I do not see why you should give the word "stationary" a non-natural meaning. It seems to me that if the mercury were put in a long trough, or in a series of troughs under fixed decomposing chambers or bells, and the alternate presentation of patches of charged mercury and uncharged mercury were effected by moving the trough or troughs to and fro, a very violent disturbance and churning up of the mercury would probably be produced. Now that is the very thing which Kellner wished to avoid. That would have been Castner's method over again. That is why the provisional specification insists on stationary mercury cathodes and moving bells. If there were any doubt about the meaning of the word stationary, there are other passages in the provisional specification which seem to me to make the meaning clear. At the very end of the provisional specification Kellner explains that the mercury cathode itself remains at rest. In an earlier part of the provisional specification he points out that the amalgam formed in the bells has, by reason of the shifting of the bells, its location alternately on one side and the other side of the bell without itself changing or moving its position. That being so, it appears to me that when Kellner, in his complete specification, proposes to move the mercury cathode and to make the bells stationary, he is

Digitized by Google

describing a different invention from that described in the provisional specification, and an invention not merely different from that, but in its leading feature at variance with the invention described in the provisional specification. I am, therefore, of opinion that the appeal should be dismissed with costs. My noble friends, Lord Morris and Lord Shand, ask me to say that they concur in the motion proposed.

Lord BRAMPTON also concurred.

Appeal dismissed, with costs.

Brockie-Pell Arc Lamp Co. (Ltd.) v. Johnson.

This case was in the Court of Appeal list on Wednesday, on the appeal of defendant from the order of Mr. Justice Kekewich of July 26 (see *The Electrician*, last issue). Before the case was called on Mr. A. J. Walter stated the parties had settled all disputes, and by consent there would be an order in the terms which had been agreed upon between the parties, who were, of course, all *sui juris*.

The Court consisted of the Master of the Rolls and Lords Justices Rigby and Collins, and the order was granted as asked.

Overhead Telephone Wires.

At the Clerkenwell (London) Police Court on Wednesday the National Telephone Co. was summoned by the Islington Vestry for having in May last fixed an overhead wire within the parish without first obtaining permission from the London County Council. A further summons against the company was for fixing an overhead wire which was not supported at intervals not exceeding 115yds., the exact distance being 126yds., without having obtained permission from the London County Council or the local authority. On the first summons a plea of guilty was entered, and on the second the facts were admitted, but Mr. Goddard, who appeared for the company, denied that the definition of "street" in the act included such a passage as that called Dove's-yard (where the excessive span occurred), which led to a meeting house of Plymouth Brethren, and was of a private character. On the first summons Mr. Bros imposed a fine of £5, with 2s. costs, and on the second a fine of 5s. and 2s. costs in order that the point of law involved might be argued before a Divisional Court.

Fell v. British Electric Traction Co.

This was an action heard before Mr. Justice Kennedy and a special jury, and was brought by Mr. John Fell, the well-known contractor, to recover £5,872, which he alleged to be due to him under a contract made between himself and the defendant company to construct the permanent way of the Potteries Electric Tramways. Defendants denied the agreement, and counterclaimed against the plaintiff. Plaintiff tendered for the construction of the Potteries tramways for £75,590, the contract providing that the work should be commenced within ten days of the signing, and that the contractor should be entitled to payment for all extra work which, in the opinion of the engineer, was not provided for or contemplated by the contract. The whole of the works were to be completed within 14 months of the signing.

Mr. LYTTLETON, Q.C., M.P., for plaintiff, said under the contract the engineer had great power, and the remedies provided were extremely stringent. The contract provided however, that so long as the work was proceeding satisfactorily the contractor had to furnish a weekly statement of quantities, and 80 per cent. of the value of each month's work was to be paid to him within six weeks, subject to any legal deductions. The question in dispute turned on whether a verbal contract was made to pay Mr. Fell on the prime cost of materials.

Defendants urged that if they were to pay Mr. Fell on the prime cost it would include the prime cost of materials which had been condemned and which the company's engineer, Mr. S. Sellon, had declined to pass.

After hearing evidence, the jury returned a verdict for defendants and judgment was given accordingly, with costs.

National Telephone Co. v. Tunbridge Wells Corporation.

The National Telephone Co. have decided to appeal from the decision of the Divisional Court (Justices Grantham and Channell) granting a writ of prohibition against the County Court judge at Tunbridge Wells from hearing and determining an appeal from a refusal of the Corporation as the highway authority to allow the company to lay their wires underground.

National Telephone Co. v. Huddersfield Corporation.

An appeal is to be lodged in this case which involves a somewhat similar question as that raised in the Tunbridge Wells action.

Jandus Arc Lamp and Electric Co. (Ltd.) v. William James Davy.

We have received a copy of a notice that plaintiffs have discontinued this action. The notice to hand is dated June 22, 1900, and is purported to be signed by the plaintiffs' solicitors, Messrs. Faithfull & Owen, Dacre House, Victoria-street, London, S.W.

Railway and Tramway Competition.—The directors of the North Staffordshire Railway Co. in their half-yearly report state that for the first time for many years they have to report a decrease in the passenger traffic, owing chiefly to the opening of the electric tramways in the Pottery district, which have abstracted many of the company's short-distance passengers.

THE ELECTRICAL ENGINEERS (R.E.) VOLUNTEERS AT THE FRONT.

In our last issue we published a letter from one of the members of the Electrical Engineers, giving an account of the engagement in which several of the corps were taken prisoners. One of these prisoners, Sergt. G. Charlton, who subsequently escaped, has written an account of his experiences to a friend in Leicester, and we now reproduce the main part of his letter from the *Leicester Post* :—

We had worked our way up the line as far as the Vaal River. There was not sufficient lighting for us to do, so they put us to bridge building, which is hard enough work I can assure you, and rough enough living. Pretoria was to have been our next place, but the Orange Free State men broke in upon the line, and burnt the bridges at the back of us, so we were sent back with the construction train to repair them. We had done three, and I think there were only two more to do, for another train was working up from Bloemfontein. The day-gang, of which we were a part, were asleep, and the night-gang were at work on the bridge. I think it would be about midnight on the 14th inst., eight of the electricals lay peacefully round a huge fire, made of the remnants of the bridge, when we were aroused by a tremendous rifle fire, at 50 yards, from the other side of the line. The panic was terrible. The train had moved off with our arms, and there was nothing to do but scoot for our liberty. The bullets went ping-ping over our heads like hailstones; one struck me on the Balaclava helmet, and I thought it would soon be all up. Soon after this I ran into Douglas, and three other fellows of ours, and soon after that we had the luck to run clean into the Boer Artillery. Another and another man were brought in later in the day. Our life with the righteous Boers was very rough, and at times even cruel. They fed us on uncrushed Kaffir corn and meat. There was no firewood, only cow manure to cook with, which when damp won't burn at all. So we sometimes had to starve. We were marched every day, and got so weak that our knees knocked together. Several times it rained, and we had to sleep hungry on the wet ground, with only one blanket. Well, on the 24th inst., I effected my escape by lying in the river bed with a young fellow from the Derby Militia. On the Sunday night, after creeping from the vicinity of the laager, we marched about 30 miles, guided by the southern cross, avoiding all roads. When day broke on Monday morning we spotted the Boer scouts not 1,000 yards from us, so dropped down in the grass and lay there all day, with Boers passing within 300 yards of us, without being seen. Well, we joined the British lines about eleven o'clock on Monday night after a very exciting time, creeping through the Boer lines. General Paget complimented us, and said we had come through the lion's mouth.

THE AMSTERDAM MUNICIPAL TELEPHONE SERVICE.

An interesting article, by Messrs. Ph. Falkenburg and J. H. van Zanten, has been published in *Municipal Affairs*, a New York magazine, on the development of the municipal telephone system in Amsterdam. In Holland, as elsewhere on the Continent, the telephone was introduced by the International Bell Telephone Co., whose offer in 1880 to establish a telephone exchange in Amsterdam, paying the municipality 21½ per cent. of the gross receipts, was accepted, the concession being transferred at the end of that year to a subsidiary company, the Netherlands Bell Telephone Co. The term of the licence was for 15 years. Subseqently the company obtained a licence from the Government for the operation of inter-communal lines, but in 1894 the Government introduced a law to transfer to itself the inter-communal system, the transfer actually taking place in November, 1897. A petition by the Amsterdam Municipal Council, that the Government should also take over the local telephone system in that town proved abortive, but the company's concession was only renewed until Nov. I, 1896, to give the municipality time to complete a system of its own, as that of the company had not extended with sufficient rapidity, and its equipment had become out of date, in addition to which the subscription rates were considered too high. In Holland, as in this country, telephones were considered to come under the definition of telegraphs under the original telegraph act, and after much discussion the municipality, having already started its telephone service on Nov. 1, 1895, found itself compelled to secure a Government concession on April 1, 1896.

The Bell Telephone Company at first used without exception aerial single conductors of bronze wire covered with gutta-percha, but since the year 1892 had placed several conductors underground, so that on October 31, 1896, they had 13,900 metres of underground cables, with 566,181 metres of wire. The exchange was equipped with primitive non-multiple boards. The municipal telephone system uses overhead conductors as little as possible and leads a double conductor into the house of each subscriber. On January 1, 1899, the length of the cable network was 137,635 metres of 28-pair cables, 4,684 metres of 56-pair cables, and in addition 2,243 metres of cables laid through the canals. There were also

Digitized by Google

28,654 metres of 14 double wires, and 973 metres of water cable of one double wire—altogether 8,378,034 metres of single wire—an increase in two years and two months of 1,380 per cent. Work is now being pushed in placing more of the above-ground conductors, which are of bronze wire, in underground conduits. There is only one central exchange, which is equipped with a horizontal multiple board having a capacity of 10,800 subscribers.

The yearly subscription price under the Bell Telephone Company was £9. 9s., the cost of the apparatus and of making the connections being included. At the outset the burgomaster and aldermen proposed a subscription price of £6, which entitled the subscriber to 800 calls yearly; for each 100 calls in addition up to 10,000 2s. 5d., and for each additional 100 calls 1s. 7d. should be paid. Strong opposition was raised on all sides to this tariff, and especially by the tradesmen, with the result that the Council established a fixed price of £7. 4s. for unlimited service, with a single payment of £2 for the installation. A single call from a public call office costs as much as 5d., however.

The number of subscribers to the Bell Company was 612 on January 1, 1882, or 1·8 per 1,000 of the population of the town. In 1884 it had increased to 1,057, or 2·9 per 1,000; in 1890 it was 1,515 or 3·7 per 1,000, and in 1896 1,784 or 3·9 per 1,000. Under municipal control on November 1, 1896, there were 130 subscribers; on January 1, 1897, 2,143 or 4·3 per 1,000; and on January 1, 1900, 3,031, or 5·8 per 1,000.

The number of calls under the Bell Company's *régime* was, during 1883, 2,006,539, or an average of 2,352 per subscriber. These decreased gradually to 1,110,368 in 1886, equivalent to 912 per subscriber, and again rose gradually to 3,650,000 in 1896, corresponding to 2,046 per subscriber. The reason for this decrease and increase is not stated in the article. Possibly it has been an experiment with the toll system of charging. The municipal exchange counted 3,916,450 calls in 1897 and 5,651,200 in 1899, corresponding to 2,181 and 2,221 per subscriber respectively, the maximum number in one day being 12,938 and 20,714 respectively.

The number of intercommunal and international calls has increased continuously from 25,923 out-going and 25,400 in-coming in 1891 to 43,038 and 48,528 in 1896. The trunk lines then passed into the hands of the Government, and the number of calls on them amounted to 149,702 out-going and 150,262 in-coming during the year 1899.

It may also be mentioned that the Bell Company had only a day service, whereas the municipal system is in operation day and night. in the year 1899 there was an average of 344 calls, and a maximum of 466 calls in a night—reckoned as from 10 p.m. to 8 a.m. The employés are slightly better off under municipal rule. They work seven hours a day instead of nine, and are paid from 8s. to 16s. a week (apprentices 3s. 3d.), as against 9s. 7d. by the Bell Company. There is also a scheme for sick pay and pension.

In 1882 the Bell Company paid £1,307 to the municipality as its royalty of 21½ per cent. of the gross receipts, and in 1894 this the royalty for the year had increased to £3,425. The municipal telephone began with a sum from the municipal treasury of £40,000, of which almost £8,800 was needed for the building for the central exchange. On January 16, 1899, the capital expenditure was £98,000, of which £80,000 more or less had been paid from loans.

The revenue of the telephone system amounted, in the year 1897, to £15,997; and in the year 1898 to £19,193. The cost of operation amounted to :—

		1897.	1898.
A.	Salaries and assessments for old age pensions	£2,697	£3,695
B.	Maintenance of buildings and equipment	1,234	1.408
C.	Office expenses	80	107
D.	Electric current	139	167
E.	Sundry	592	537
	Total	£4,742	£5,914

The gross surplus was expended in the following manner :—

Interest on loan capital	£2,248	£2,365
Redemption of loan capital	2,437	3,180
Payment to the municipal treasury	4,000	4,000
Total	£8,685	£9,545

The net profit, which was used for extensions, thus keeping down bonded indebtedness, was in 1897 £2,568 and in 1898 £3,734.

Thus at the outset the taxpayers receive no great direct advantage from municipal operation, since the payment which the municipality received from the Bell Telephone Company, amounting during the last year to £3,425, has been increased to £4,000, and stereotyped at that amount. When the capital is redeemed—and this will be accomplished in a short time—the situation will naturally be changed; but it must not be overlooked that each new addition to the existing net costs considerable capital, and more proportionately the further it extends from the central exchange. This cost will also be added to if the subscribers increase to over 3,600; since at present a switchboard for 3,600 subscribers is used. Should the number increase to 10,800 (which so soon as the fees are reduced will not be long delayed) it is stated that the entire central exchange must be re-arranged, or the system of a single exchange must be abandoned.

The municipality of Amsterdam in late years has had much experience in the municipalisation of public undertakings. Ten years ago it possessed no single large monopolistic undertaking, and now it owns the gas works, the waterworks, a slaughter-house, a telephone system, a clothing factory for the uniforms of municipal employés, a horse-railroad presently to become an electric railroad, and two steam ferrries.

A DOUBLE CARBON ARC LAMP.

The accompanying illustrations show the construction of Messrs. Körting and Mathiesen's latest pattern of shunt arc lamp arranged for double carbons. One of the characteristics of this

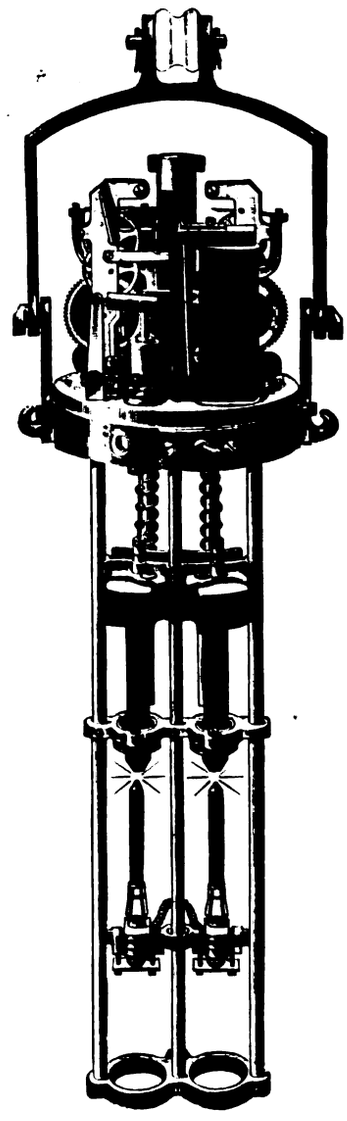

Fig. 1.

lamp is that it is provided with two independent clockwork motions, built, however, on the same bedplate. Fig. 1 shows the general construction of the lamp and Fig. 2 is an enlarged view of the mechanism. The last-named figure shows the regulating parts, which, by means of a balanced anchor or detent, controls the descent of the carbons. The mechanism consists of a shunt magnet A together with a clockwork train B connected by means of the rod O to the magnet anchor M. Spiral springs N supply the controlling force. The flywheel P of the clockwork B touches the tongue 2 which is carried by a double arm lever V which, together with the second tongue 2, are under the common influence of the heating compensator K, which keeps the regulating tension always constant. To adjust the variation in the weight of the carbons, the clockwork is slanted to one side, and of course the necessary dash-pots are provided to prevent sudden movements of the parts. It is claimed

Digitized by Google

that this double carbon lamp will burn either singly on 110-volt circuits or in pairs across 220 volts or 230 volts, a matter of considerable importance now that consumers are supplied at these higher

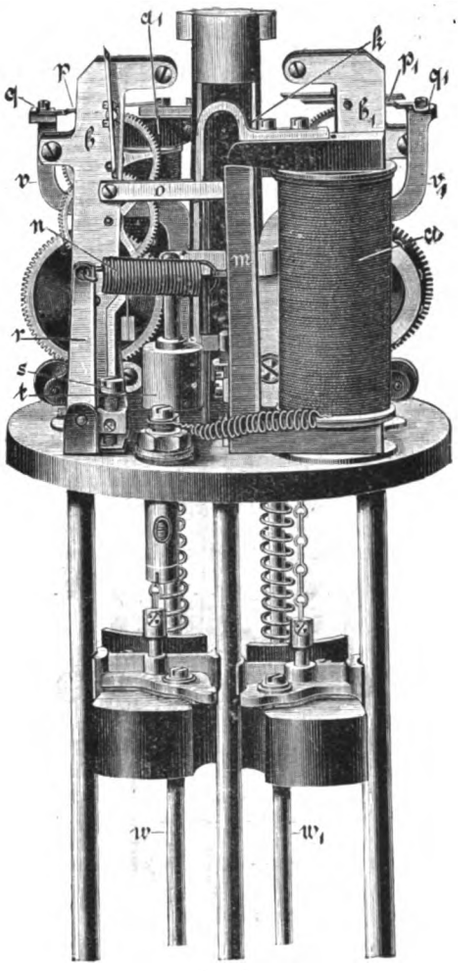

FIG. 2.

voltages. It is further claimed that the double carbon lamp, as regards intensity of light, is far superior to the enclosed arc. The agent for these lamps in this country is Mr. G. Braulik.

MUNICIPAL, FOREIGN & GENERAL NOTES.

Accrington.—The Electric Light committee anticipate being in a position to supply electric current by Oct. 1. The price has been fixed at 5d. per unit for lighting purposes, and 1½d. per unit for current for power purposes.

Bellingham.—At a parish meeting last week it was unanimously resolved to consent to the application of the Northern Counties Electricity Supply Co. for a provisional order.

Bootle.—The Board of Trade have issued their award in the dispute between the Council and the Liverpool Corporation over the electric tramways. It was announced by the chairman of the Bootle Highways committee (Councillor Hall) on Wednesday that the award settled the terms between the two corporations for a period of 25 years, and that it was favourable to the Bootle Corporation.

Brisbane (Queensland).—The Municipal Council received four applications for the transfer of their order to establish electricity works—viz., Messrs. Arthur Wright & Hy. Reason (Brighton, England), the Electrical Construction Co. of Australasia, Mr. E. C. Barton (Brisbane), and the Brush Company. The Council obtained the opinion of Mr. John Hesketh on these applications. In his report, Mr. Hesketh reminds the Council that in July, 1897, he advocated the municipalisation of such works as local transit and lighting, and he was still of opinion that unless there were special reasons to the contrary, such works should not pass into the hands of private companies. If the Council retained the order in their own hands they would have to contemplate an initial capital expenditure on the most favourable scheme of not less than £30,000, but if the work were properly carried out of from £100,000 to £150,000. The public lighting would then cost them more than the price quoted to them, and if they entertained the offer they would, in addition, have 10 arc lamps free of cost. If they generated their own current the cost would in all probability be greater than the figure given by Messrs. Wright and Reason, for they had quoted a price which he did not think they could hope to approach for many years to come. The possibility of recouping the difference from private lighting would not be so good with the municipality whose operations were confined to the city area as with a company supplying adjacent councils such as South Brisbane, as he understood it was the intention of the company to do. Looking at the financial aspect of the question there was nothing to lose and something to gain by accepting the offer. Having regard to all the circumstances he was of opinion that the terms offered by Messrs. Wright and Reason were more advantageous to the Council than either the proposition to instal separate plant or the alternative of their distributing a supply of electricity obtained by them from the tramways company. The report together with the various offers were discussed, but were eventually referred to the Works committee.

Bristol.—The accounts of the electricity department for the year ended March 25 were presented last week. The number of consumers was 1,215, an increase of 248 during the year. The equivalent number of 8 c.p. lamps connected was 85,956, compared with 68,536 at the corresponding period last year. During the year a number of motors had been connected to the mains. The number of units sold was 1,812,511, an increase of 449,725. The gross receipts amounted to £31,717. 14s. 2d., and the gross expenditure to £17,962. 1s., leaving a gross profit of £13,755. 13s. 2d., from which has to be deducted interest on loans (£6,019. 15s. 8d.) and sinking funds (£7,590). There was thus a credit balance of £145. 17s. 6d.

Burnley.—The Corporation have served notice on the Burnley and District Tramways Co. of intention to purchase the company's lines within the borough.

"Cassier's Magazine."—The August issue contains articles on "Electric Cranes in German Harbours," "Openings for Mechanical Engineers in China," "The Manufacture of Light," and "Some British Milling Machines."

City of London.—At the Court of Common Council on Thursday last the Streets committee presented a report on the application of the Postmaster-General for permission to take up the roadway in St. Bride-street and Holborn Circus for forming a connection with certain subways for telegraph wires. The Postmaster-General would not undertake to pay any fees or rent in respect of the subways. It was recommended that the application be complied with, and this was agreed to. An application by the National Telephone Co. for permission to lay wires in the subways in front of the Mansion House was refused.

The following recommendations by the Streets committee were agreed to :—

(1) That the purchase money to be charged against the City undertaking for the portion of the site required for the erection of the City generating station be determined *pro rata* to the cost of the whole site. (2) That the Charing Cross & Strand Electricity Supply Corporation shall not acquire any interests in adjoining land without the previous consent of the Corporation being obtained; such consent, however, not to be unreasonably withheld. (3) That the Corporation agrees to allow the company the necessary running powers over the proposed line of railway shown on the plan submitted, subject to a nominal rental, and without prejudice in any way to the rights of the Corporation to use or alter such line of railway.

Cork.—The Corporation were recently recommended to erect 85 additional arc lamps in the principal thoroughfares, but a deputation from the Cork Gas Co. has succeeded in inducing the Corporation to defer the matter. The deputation stated that by the adoption of electric lighting the Corporation had already thrown upon the hands of the gas company 250 gas lamps, and by this new proposed extension they would add another 300 gas lamps. The electric lighting company was entirely composed of strangers, whereas the gas company's shareholders were all local ratepayers. They asked that the matter be deferred until the Corporation would have more experience of electric lighting and incandescent gas lighting. They objected to the wholesale extension of the light at great cost to the ratepayers. This pleading was, as we have said, successful, and Cork must wait for its improvements.

Crewe.—The proposal to borrow £10,000 for electric lighting extensions was approved by the Council on Wednesday.

Derby.—Power to construct a system of electric tramways, estimated to cost about £200,000, is to be sought by the Council.

Gravesend.—The report on electric lighting which was recently prepared by the consulting engineer (Mr. W. H. Trentham) was discussed by the Council last week. The report deals with the proposal to erect a refuse destructor, as well as the supply of electric current for lighting and traction, and the Council are recommended, in view of the possibility of current being required for tramways, to adopt the low tension three-wire system of distribution with a pressure of 450 to 460 between the outers; 24 arc lamps of 800 c.p. each would be erected in the leading thoroughfares, and the total cost of the scheme is estimated at £30,580. The report was reserved for further consideration by the Council in committee.

Hampstead (London).—The Lighting committee are making an experiment in incandescent electric lighting. Belsize-avenue is to

Digitized by Google

be lighted with incandescent electric lamps of 50 c.p. and 150 c.p., in place of arcs.

Hanley.—The charge for electric street lighting has been increased £3 each per annum for arc lamps and 5s. each for incandescents, making the charge £22 and £3. 5s. respectively.

Helston (Cornwall).—This town has up to the present been lighted by gas by a private company at 5s. 10d. per thousand, the street lighting costing £100 per annum. Several members of the Town Council consider that the electric light could be introduced with advantage; and there is now to let a large water mill belonging to the Corporation filled with expensive machinery used in corn grinding. This mill is said to possess the best supply of water of any mill in the county, and is let, we learn, at a low rental. We have reason to believe the Helston Council would entertain favourably a proposal for the establishment of electricity works in the town, and there seems a probability that current would be taken by the Council for the public lighting. Water is plentiful, and there really seems a good opportunity for establishing electricity supply at Helston.

Infirmary Lighting.—The electric light is being installed at the Wolverhampton Eye Infirmary by the District Electric Co. to the specification of Mr. L. Stallybrass, of Wolverhampton.

Inquest.—At the inquest at Upper Sydenham on the bodies of F. W. Elliston, stoker, and W. H. J. Philbrook, labourer, who died from the effects of the boiler explosion at the generating station of the Crystal Palace District Electric Supply Co., at Upper Sydenham, after formal evidence had been taken the inquiry was adjourned for three weeks.

Leatherhead.—The Board of Trade have notified the Council that they will not sanction the proposed leasing of the Council's provisional order to a firm of electrical engineers, as there must be an actual transfer of powers. The question has been referred to committee.

Light Railways.—The Light Railway Commissioners have submitted the Aldershot and Farnborough Light Railway (Extension) Order to the Board of Trade, and objections must be lodged by 18th inst.

An inquiry was held at Bath on Monday into the joint application of the Bath Corporation and a private syndicate (consisting of Sir James Sivewright and Mr. L. Hirsch) for authority to construct a system of electric tramways in Bath and district. It was stated that the promoters had agreed to construct and work the tramways paying the Corporation a rental for wayleaves increasing from £400 to £500 per annum. The Corporation retain power to purchase. The Commissioners decided in favour of the application.

Liverpool.—The work of converting the tramways to electric traction is actively proceeding. In 1898 the experimental line from St. George's Church to the Dingle was opened. Last year 30 miles of track were relaid. Up to date 80 miles have been reconstructed and equipped for the overhead system, and the electric tramways department hope to complete the system this year. By the end of this year the Corporation will have cars adequate to carry 100 million passengers a year, and by next summer for 150 millions. It is likely that by that time a uniform 1d. fare will be established, and passengers will be able to travel nearly 8½ miles for 1d. The Old Swan electric tramway route will be opened for traffic on Monday.

London County Council.—At Tuesday's meeting a loan of £42,400 was made to the Shoreditch Vestry for electric lighting.

The report of the Highways committee in connection with the application to be made to Parliament for tramway extensions (set out in our last issue) was adopted.

Maidstone.—It has been resolved to apply for a provisional order for constructing and working electric tramways. The Corporation are engaged in establishing municipal electricity supply.

Manchester.—The Council on Wednesday decided to adopt the Gamewell system of fire alarms. The Watch committee recommended that the plant should consist of 200 street box stations, and that the apparatus should be purchased outright. The total cost of equipment would be £9,300, plus £6,300 for leasing from the electrical department 100 miles of lines for 10 years, and wages, depreciation, and repairs for 10 years. The cost would be at the rate of £8 per box per annum, and at the end of 10 years cost of maintenance would be £3. 7s. per annum.

Marylebone (London).—A meeting of this Vestry took place last evening, and the discussion was resumed on the report of the advisory special electric lighting committee recommending that negotiations be concluded with the Metropolitan Electric Supply Co. for the transfer to the Vestry of its undertaking under the West London electric lighting order. A heated discussion followed, during which Dr. Snape urged that an expiring Vestry should not consider a vast scheme like this, but should leave it to be dealt with by the new Council. After much talk the resolution that the special committee be empowered to conclude negotiations with the company was put and carried with only one dissentient.

Norwich.—The Board of Trade inspection of the track of the Norwich Electric Tramways Co. took place on Thursday last. Some of the cars commenced running on Monday, and the whole of the system was opened for traffic yesterday (Thursday). The line was fully described in *The Electrician* for May 18 and 25 last.

Oldham.—The Council have applied for sanction to borrow £280,000 for electric tramways.

Penistone (Yorks.)—A conference of representatives of the Penistone and Thurlstone Councils is to be held to consider the advisability of adopting a joint electric lighting scheme.

Pwllheli.—An offer by Messrs. Bennett and Ward-Thomas to take a transfer of the Pwllheli provisional order is to be considered at the next meeting of the Council.

Rathmines (Dublin).—The electricity supply works will be officially opened by the Lord Lieutenant on 24th inst.

Salford.—The Corporation have decided to increase the salary of the borough electrical engineer (*pro tem.*), Mr. F. A. Wilkinson, from £160 to £250 per annum.

Sheffield.—The Abbeydale electric tramway route has been opened for traffic, although not yet officially inspected by the Board of Trade.

Stockport.—The accounts of the Gas and Electricity department show a profit on the electricity branch for the first 16 months' working of £118, which is considered satisfactory. It has been decided to introduce the maximum demand system of charging—5d. per unit for the first hour's maximum demand, and 3½d. after.

Stourbridge.—The Council have resolved to establish municipal electricity works, and to oppose the proposed application of the Midland Electric Corporation for Power Distribution for a provisional order.

Sunderland.—A satisfactory trial trip over the Christchurch and Roker electric tramway took place on Tuesday.

Swansea.—The work of laying mains in connection with the Council's electric lighting scheme has been commenced.

Technical Instruction.—The annual report of the Middlesex County Council Technical Education committee states that the classes on electricity in the county, although small, have been much appreciated by the students. The first year's work in electric wiring has been successful, the class having been attended by artisans representing gas and hot water fitting, plumbing, and electric light wiring.

Trowbridge.—On the advice of their consulting engineer (Mr. D. Stevenson) the Council are making a canvass to ascertain the support likely to be accorded the proposed electric lighting project.

Tunbridge Wells.—At a meeting of the Town Council this week a discussion arose on a report of the Lighting committee recommending the Council to at once proceed to erect an additional chimney at the electricity works at an estimated cost of £3,500, to provide a new flue and economiser at an estimated cost of £1,000, and to authorise the committee to consult Sir William Preece if necessary from time to time during the progress and upon the completion of these works, and to obtain a further report or reports from him. These, and other recommendations in the report were approved.

Utilisation of Water Power in Austria.—Plans are being prepared by the Austrian Schuckert Co. for the erection of a water power electricity station at Krottersdorp, Styria.

Water Power Utilisation in Italy.—La Società per le Strade Ferraté del Mediterraneo has secured a 30 year concession of the water power of the Ticino river, Milan, for the generation of electrical energy.

Watford.—The Council have decided to engage Mr. Arthur Wright to prepare a report on the present position of the electricity works, and particularly as to the necessity of carrying out extensions.

Whitechapel (London).—The foundation stone of the new electricity generating station in Osborn-street, E, was laid by the Chairman of the Board (Mr. John Harris) yesterday.

Wrexham.—The Wrexham Tramways Co. have applied to the Board of Trade for an extension of 12 months to comply with the terms of the Wrexham Tramways Order (1899).

TRADE NOTES AND NOTICES.

[*Notices for insertion under the above heading must reach the Office no later than first post Thursday morning. New Catalogues, Price Lists and similar matter should be sent early in the week.*]

TENDERS INVITED.

Portsmouth Corporation invite tenders for plant and apparatus for the equipment of their proposed tramway power station. Specification may be obtained from the tramways engineer (Mr. E. Rotter), and further particulars are set out in an advertisement. Tenders must be delivered to the town clerk (Mr. Alex. Hellard), Town Hall, Portsmouth, not later than 10 a.m. of Sept. 4.

Digitized by Google

Belfast Electric committee invite tenders for the supply and erection of auxiliary feed water heater, with pipe connections. Specifications, &c., may be obtained from the city electrical engineer (Mr. Victor A. H. McCowen), and tenders must be delivered at the offices of the town clerk (Sir Samuel Black) by noon on 15th inst. See advertisement.

Hanley Electric Lighting committee invite tenders for two Lancashire boilers and fittings, including steam receiver; water-tank, girders, and pumps; fuel economiser, with engine or motor; smoke chimney, exhaust fan, with engine, &c; feed water heater, forced draught fittings, fire bars or other appliances to boiler furnaces, and coal conveyor and bunkers. Specifications from the borough engineer and surveyor (Mr. Joseph Lobley) and from the Corporation electrical engineer (Mr. C. A. Cowell). Tenders to Mr. Lobley before 25th inst. An advertisement contains further particulars.

South London Electric Supply Corporation invite tenders for condensing plant. Further particulars are set out in an advertisement, and specifications may be obtained after 7th inst. of the consulting engineers (Messrs. Kincaid, Waller and Manville), 29, Great George-street, Westminster. Tenders to the secretary of the company (Mr. H. H. Boyer), Bengeworth-road, Loughborough Junction, S.E., before 10 a m. on 14th inst.

Luton Town Council require tenders for watt and demand meters. Specifications after 13th inst., at the offices of the consulting engineer (Mr. Albion T. Snell), Suffolk House, Cannon-street, London, E.C., and tenders to the town clerk (Mr. George Sell), Town Hall, Luton, by noon of Sept. 14. An advertisement contains further particulars.

Warrington Corporation invite tenders for wiring and fitting up the Parr Hall and markets for the electric light. Specification from Mr. W. H. Grimsdale, Bank House. See also advertisement.

Grimsby Corporation invite tenders for an additional steam dynamo and extension of switchboard. Specification, &c., from the consulting engineer (Prof. A. B. W. Kennedy), 17, Victoria-street, Westminster, and tenders must be delivered at the offices of the town clerk (Mr. W. Grange), St. Mary's Gate, Grimsby, before 18th inst. An advertisement contains additional particulars.

Grimsby Corporation invite tenders for wiring their electricity works. Specifications from town clerk, to whom tenders by Aug. 8.

Newcastle-on-Tyne Corporation invite tenders for constructing about 5 miles of double-track tramway. An advertisement contains further particulars, and tenders addressed to the New Tramways committee must be in by Wednesday, 22nd inst.

Edinburgh Corporation invite tenders for arc lamp posts and for six (or nine) months' supply of steam coal for their electricity works. Tenders to town clerk by 8th inst.

Central Electric Supply Co. invite tenders for dry back marine boilers with mountings, feed and drain pipes, &c. (or, alternatively, water-tube boilers). Tenders to general manager (Mr. F. J. Walker), 19, Carnaby-street, Golden-square, London W., by 10 a.m. Aug. 20.

Bradford Guardians invite tenders for an electric lighting installation at their workhouse. Tenders to clerk, 22, Manor-row, Bradford, by noon Aug. 13.

Halifax Corporation invite tenders for mechanical stokers, and also incandescent lamps. Particulars from borough electrical engineer (Mr. H. F. Street), Foundry-street, Halifax.

The *Pacific Cable* committee invite tenders for the supply and laying in the Pacific Ocean of 8,272 nautical miles of telegraph cable between Vancouver and Queensland. Forms of contract, &c., from and tenders to Messrs. Clark, Forde & Taylor, 4, Great Winchester-street, London, E.C., by noon 14th inst.

Pembroke (Dublin) Council invite tenders for wiring the town hall, &c. Tenders to clerk by 9th inst.

Accrington Corporation require tenders for wiring their electricity works. Tenders to town clerk by 10th inst.

Dorking District Council invite offers for leasing their provisional order. Tenders to clerk by Aug. 30.

Salford Corporation invite tenders for laying cables, tramway feeders, and street lighting. Tenders to town clerk by Aug. 13.

Stockport Tramways committee invite tenders for 20 double-deck tramcars with electrical equipment. Tenders to clerk by Aug. 31.

Tenders are invited until Sept. 10 next by the *Hamburg* Finance deputation for two 30-ton electric cranes.

TENDERS RECEIVED AND ACCEPTED.

The London County Council Fire Brigades committee have received the following tenders for the wiring and fittings of Paddington fire station.—

Tamplin & Makovski (*accepted*)	£248	4	6	F. A. Glover & Co.	£280	0	0
G. E. Taylor & Co.	304	0	0	Concentric & General Contract Co.	264	0	0
F. J. Coleby	282	0	0	Barlow Bros. & Co.	257	0	0

Ealing District Council have received the following tenders for the supply of steam dynamo, alternator, and storage batteries for their electricity supply works. The tenders marked * are recommended for acceptance, subject to the sanction of the Local Government Board for the necessary loan :—

Steam Dynamo Alternator.

*Siemens Bros. & Co.	(Belliss comp. cond. engine)	£2,881	11	0
Ditto	(Browett c/c)	2,945	0	0
Ditto	(Bellis trip. exp.)	3,151	11	0
Crompton & Co.	(Belliss c/c)	2,784	15	0
Ditto	(Belliss t/e)	3,054	15	0

Storage Batteries.

					Ann. main. (for 10 years).
*Tudor Accum. Co.	£1,836	3	0	...	£88
D.P. Battery Co.	1,522	11	6	...	—†
E.P.S. Co.	1,671	5	0	...	153
Hart Accum. Co.	1,979	14	0	...	196
Marquand Accum. Co.	2,360	8	6	...	132
Chloride Elec. Storage Synd.	2,576	0	0	...	—‡

† Cost of renewals would be 4½ per cent. during six years.
‡ £142 first five years, £166 for second five years.

Cardiff Corporation have accepted the following tenders in connection with their proposeed electric tramway scheme :—

Dick, Kerr & Co.	(about 1,000 tons of steel tramway rails and fish plates)	£8,522
Ditto	(tie bars)	565
Ibbotson Bros.	(fish bolts and nuts)	170
Bayliss, Jones & Bayliss	(sole plates)	50
Askham Bros. & Wilson	(points and crossings)	355
Ditto	(drain rails)	378
Felten & Guilleaume	(copper bonds)	618

The following tenders have been received by the Walthamstow District Council for the supply of 45 arc lamps. Mr. J. Enright is consulting engineer :—

Oliver & Co. (*accepted*)	£1,373 17 6	Elec. Transmission Co.	£1,658 0 0
J. D. F. Andrews & Co.	2,064 19 0	General Electric Co.	1,627 15 0
Brush Co.	1,860 0 0	Johnson & Phillips	1,524 9 6
Callender's Co.	1,796 0 0	Gilbert Arc Lamp Co.	1,277 10 0
Brockie-Pell Arc Lamp	1,755 2 6	Frank Suter & Co.	1,273 10 0

The following tenders were received for the supply of lamp standards for the Victoria Embankment and Westminster Bridge lighting :—

W. Macfarlane & Co. (two designs) (*accepted*)	£29 10s. or £31	W. Lucy & Co.	£34 10
W. A. Baker & Co. (two designs)	£32 10s. or £35	R. Carr & Co. (two designs)	30 0
T. Brown & Co.	£39 10	J. Allen & Son	29 10
W. Singer & Co.	35 0	Mackenzie Bros.	28 5
		A Brown & Sons	27 0

Messrs. J. Whitley & Co.'s tender of £214. 2s. was accepted for an overhead traveller for the generating station at Victoria Embankment.

The Dublin Electric Lighting committee, acting on the advice of their consulting engineer (Mr. Robert Hammond), recommend the Council to accept the following tenders for the plant for the new electricity works at Pigeon House :—

General Electric Co.	(Polyphase generators with compound engines : Stewart engines and Oerlikon generators)	£33,061
Holdsworth & Sons	(Lancashire boilers)	6,653
Ditto	(economisers)	1,060
Babcock & Willcox	(water-tube boilers)	5,278

Chelmsford Council have accepted the tender of the Chelmsford Electric Lighting Co. for lighting the public lamps for five years from March 25, 1901, at the following rates : Arc lamps, £25. 5s. each per annum ; incandescent lamps, £3. 3s. A clause has been inserted in the contract to the effect that if at any time the Council should be desirous of extinguishing eight specified arc lamps at 11 p.m., or extinguishing the whole of the arc and incandescent lamps one hour earlier in the morning, or agreeing to the electric lighting being started half an hour later than the present time table, and shut down half an hour earlier in the morning, they shall be charged £23. 12s. 6d. per arc lamp per annum in the first instance, taking off a further 5s. per arc lamp and 3s. per incandescent lamp if the whole of the arc and incandescent lamps are extinguished one hour earlier in the morning. At present the charges are £22. 10s. per arc and £2. 6s. 10d. per incandescent lamp per year. If the eight specified arcs were switched off at 11 p m., and if the lighting were begun later and shut down earlier only £70 a year would be saved.

Croydon Town Council have accepted the tender of the British Thomson-Houston Co. for 35 car bodies, motor car equipments, feeders and overhead construction work in connection with their proposed electric tramway scheme at £57,140. The tender of Messrs. J. Smith & Sons for the erection of additional car sheds at £9,400 has also been accepted.

Bradford Corporation have accepted the tender of Messrs. S. Z. de Ferranti (Ltd.) for a switchboard for the Valley-road electricity works.

Newcastle New Tramways Committee have accepted the tender of the British Insulated Wire Co. for the supply of trolley wires at a

Digitized by Google

cost of over £6,000, and that of Mr. S. E. Easton for building the superstructure of the power station at the Manors at £3.544, in this case the contractor guaranteeing to complete the work in 18 months.

Bootle Council have accepted the tender of Callender's Co. for supplying arc lamps, cables, &c., for the electric lighting of Derby, Rimrose and Knowsley-roads, for £6,855. 1s. 5d. £80 per annum has been agreed upon for the maintenance of the cables for 10 years.

Hull Corporation have accepted the tender of Messrs. Thomas Parker (Ltd.) for the supply of five high-tension continuous-current rotary transformers at £5,985. The Electric Construction Co. also tendered at £6,293. The Corporation have also accepted accepted the tender of the Walsall Electrical Co. for wiring and fitting Springhead pumping station for electric light at £210.

The tender of Messrs. W. T. Glover & Co. has been accepted by the Hampstead Vestry for the supply of electric light cables for the electricity department for the ensuing 12 months.

Hackney (London) Vestry have accepted the tender of Mr. J. Greenwood for the erection of electricity station buildings at £31,589. 8s. 6d.

APPOINTMENTS VACANT AND FILLED.

The tramways department of the Glasgow Corporation require a first-class mechanical engineer to take charge of the steam plant and general oversight of the tramways power station. Salary £250 per annum. An advertisement gives further particulars, and applications have to be sent to Mr. John Young, general manager, 88, Renfield-street, Glasgow, by Aug. 20.

Hull Electric Lighting committee have vacancies for two electrical improvers. Applications to the Chairman of committee, Town Hall, Hull, by noon of 23rd inst. Mr. A. S. Barnard is city electrical engineer. See advertisement.

The D. P. Battery are admitting two or three students as pupils in their works at Bakewell, Derbyshire. Particulars from 66, Victoria-street, London, S.W.

The Jandus Arc Lamp and Electric Co., Hartham Works, Hartham-road, Holloway, London, N., require an assistant electrician. See advertisement.

Applications are invited for the position of senior demonstrator in electrical engineering at the South Western Polytechnic, Manresa-road, Chelsea, London, S.W. Forms of application from the secretary. See advertisement.

The position of senior demonstrator in applied physics, at the South-Western Polytechnic is vacant. Particulars from secretary up to 13th inst. See also advertisement.

An assistant lecturer and demonstrator in electrical engineering is required for the Croydon County Polytechnic. Applications to chairman of committee (Mr. J. W. Helps), by Aug. 14. See advertisement.

A young man able to take photographs and who understands Rontgen-ray photography is required at the Middlesex Hospital, W. Application to secretary-superintendent. See advertisement.

A headmaster is required for the science department of the High School, Dundee. Applications to secretary, 46, Reform-street, Dundee.

Todmorden Technical Instruction committee require teachers for evening classes in electric lighting and power transmission and telegraphy and telephony. Forms of application from secretary.

The position of principal of the Heriot Watt College, Edinburgh, is vacant. Applications to clerk.

A principal is required for the Harris Institute, Preston. Applications to secretary by 13th inst.

Telegraph linesmen are required for Lagos, Africa. Salary £200 per annum. Applications to the Crown Agents for the Colonies, Downing-street, London, S.W., before Aug. 13. Inquiries to the consulting engineers to the Crown Agents, Messrs. Preece & Cardew, 13, Queen Anne's-gate, London, S.W.

Mr. D. O. Syd. Davies, B.Sc., lecturer and demonstrator in physics and electrical engineering at the Wolverhampton Technical School, has been appointed to a similar position at the City of Norwich Technical Institute.

Mr. Henry Cottam has been appointed junior demonstrator in physics at the South-Western Polytechnic, Manresa-road, London, S.W.

Mr. J. Ferguson Bell, hitherto engineer and manager of the gas and electricity departments of the Stafford Corporation, has been appointed chief engineer and manager to the Derby Gas and Coke Co.

Mr. H. Bohle has been appointed lecturer and demonstrator in electrical engineering at the Birmingham Municipal Technical School, and Mr. W. R. Parsonage has been appointed lecturer and demonstrator in the engineering department.

Mr. W. Beckit Burnie, of the South Western Polytechnic, has been appointed chief lecturer in electrical engineering at the Royal Technical Institute, Salford.

Dr. Albert Griffiths, of the University College, Sheffield, has been appointed head of the physics department at the Birkbeck Institution, London.

Mr. E. W. Marchant, D.Sc., A.C.G.I., has been appointed first assistant in the electrical engineering department of the City and Guilds Technical College, Finsbury, in place of Mr. E. A. O'Keeffe, resigned.

BUSINESS NOTICES.

The Edison & Swan Company, owing to the expansion of business, have removed their supply department to large warehouses at 27, College-hill, E.C. (almost immediately opposite their head offices and showroom in Queen-street), where there are departments for the supply of accessories, electroliers, bell goods, glass, wires and cables, &c, from large and varied stocks.

Messrs. F. E. & A. S. Elmore have entered into partnership as consulting electro-metallurgists, and have opened offices at 4, Bishopsgate-street Within, London, E.C.

Messrs. J. Coxon and J. H. Burrell have, we are informed, renounced their claims as partners of the firm of Coxon, Schmahl & Burrell, Grainger-street, Newcastle-on-Tyne, and Mr. S. J. Dickinson has entered into active partnership with Mr. W. Schmahl. The business will be continued under the style of Dickinson, Schmahl & Co.

BANKRUPTCIES, LIQUIDATIONS, &c.

The examination of George Stanley Green, electrician, &c., 43, Birchfield-road, Birmingham, took place at the local county court on Monday. The statement of affairs showed liabilities £279, assets £12. Bankrupt said he had derived his knowledge of electrical matters at the Midland Institute and by private study. He had been a gilder and plater before he entered upon electrical work. He had no capital, and the business had been a hand-to-mouth one. Examination closed.

It has been decided to wind up W. C. Bersey & Co. (Ltd.) voluntarily, and Mr. W. C. Bersey, 4, Hythe-road, Willesden, N.W., has been appointed liquidator.

A meeting will be held on 28th inst., at 23, Queen Victoria-street, London, E.C., to receive an account of the winding up of the Electro-Chemical Co. (Ltd.)

A meeting will be held at Bank Chambers, Corn-street, Bristol, on Sept. 4 to receive an account of the winding-up of the Western Counties Electric Light and Power Syndicate (Ltd.). Mr. H. Dyer is liquidator.

A meeting to receive an account of the winding-up of the Electric Automobile Syndicate (Ltd.) will be held on Oct. 3. Mr. A. Thom is liquidator.

A receiving order has been made against Walter Vernon Scott, electrical engineer, lately residing at 1, Shaftesbury-road East, Hammersmith, London, W.

Winding-up Petition.—A petition has been presented to the Chancery Division by creditors and contributories of the London Electrical Cab Co. (Ltd.) for a winding-up order. The petition will be heard on 8th inst.

Sale by Auction.—Messrs. Wheatley Kirk, Price & Co. make a preliminary announcement in another column of the sale by public auction of high-class new engineers' plant and machinery, shafting, tools, accessories, stores, &c., at Ormonde Works, Romford, Essex, at an early date. Catalogues are in preparation.

Plant for Sale.—The Woolwich Electric Light Co. have for sale a 120kw. E.C.C. alternator. See advertisement.

The Leeds Corporation invite tenders for the purchase of plant at present in use in connection with their system of electric tramways. Further particulars are set out in an advertisement; and the plant, which is in excellent condition, can be inspected on application to the engineer-in-charge at the Corporation generating station. The consulting engineers (Messrs. Hopkinson & Talbot), 26, Victoria-street, London, S.W., will supply additional information; and tenders, addressed to the Tramways Committee, should be sent to the town clerk's office, Town Hall, Leeds.

Exports of Electrical Apparatus and Material.—The following list gives official particulars of the exports of British manufactured electrical apparatus and material (including telegraph and telephone wire and material, but not including electrical instruments or machines, which are not separately specified) from July 25 to July 31, with the ports of destination:—

Africa—Alexandria, £138 (telegraph material); Cape Town, £493; Chinde, £124 (telegraph wire); Durban, £382; East London, £892; Port Elizabeth, £1,250. *Argentina*—Buenos Ayres, £67. *Australasia*—Auckland, £105; Perth, £120; Lyttleton, £50; Sydney, £1,300; Wellington, £1,636. *Belgium*—Brussels, £27; Ostend, £350. *British Guiana*—Demerara, £87. *Ceylon*—Colombo, £24. *China*—Shanghai, £63. *Germany*—

Bremen, £230; Hamburg, £51. *Holland*—Amsterdam, £35; Rotterdam, £180 (telegraph material). *India*—Bombay, £70; Calcutta, £1,410. *Japan*—Hiogo, £99; Yokohama, £657. *Malta*, £303. *Mexico*—Rosario, £522 (telegraph material). *Siam*—Bangkok, £42. *South America*—Parana, £291. *Straits Settlements*—Malacca, £229; Singapore, £198 (£129 telegraph material). *United States*—New York, 2,459 cases (telegraph material). Total £11,428, against £9,736 in the corresponding week last year (July 26 to Aug. 1).

PATENT RECORD.

The following list of Applications for Patents and Specifications published has been compiled for this journal by MESSRS. J. C. CHAPMAN and Co., *Chartered Patent Agents, of 70, Chancery-lane, W.C., from whom any available information in connection with Patents, Designs, and Trade Marks may be obtained.*

APPLICATIONS FOR PATENTS.

NOTE.—*The undermentioned Applications are not open to public inspection until after the acceptance of the complete Specification. The names within parentheses are those of communicators of inventions. When complete specification accompanies application, an asterisk is affixed.*

May 12, 1900.

8,827. H. W. BUTLER. London. Improvements in or connected with electrical batteries.

8,829. J. SKOPEC and N. HEID. London. Improved safety lock with electrical door-opening device.*

May 14, 1900.

8,866. P. A. NEWTON. London. Improvements in electric signalling apparatus. (H. G. Carleton, United States.)*

8,880. H. EICHWEDE. London. Improvements relating to means for recording the number and duration of telephonic communications.*

8,883. W. E. EMERY. London. A new and improved lock for switches and for other purposes.

8,894. H. KOLLER. London. Improvements in electric smelting furnaces.*

May 15, 1900.

8,901. M. J. ASTLE and C. H. GUEST. Derbyshire. A method of applying auxiliary electric drive to gas and other motors as used on cycles and motor vehicles.

8,945. A. J. BOULT. London. Improvements in or relating to electric motors particularly applicable for propelling boats. (T. B. Hatch, United States).*

8,968. M. J. P. O'GORMAN. London. Improved means for protecting electric conductors.

May 16, 1900.

9,033. J. P. MALLETT. London. Improvements in strap oils for electrical machines. (Date applied for under Patents, &c., Act, 1883, sec. 103, Oct. 17, 1899, being date of application in United States.)

9,058. F. C. NEWELL. London. Improvements in electric brakes.

9,059. F. C. NEWELL. London. Improvements in electric brakes.

9,060. F. C. NEWELL. London. Improvements in electro-magnetic brake shoe.

9,061. F. C. NEWELL. London. Improvements in automatic regulator for electric brakes.

9,084. A. G. STOCKWELL. London. Improvements in electric arc lamps

May 17, 1900.

9,110. M. PAUL. Glasgow. Improvements in contact pieces for transmitting the current from the fixed base to the revolving or swinging top of electric search light projector. (J. Paul, India.)*

9,111. H. ENGLAND. London. Improvements in or relating to apparatus for maintaining in a "taut" condition the cord or rope employed for actuating the "trolley-arm" employed in connection with electrically-propelled cars or vehicles.

9,133. L. LOMBARDI. London. An improved process for manufacturing thin homogeneous plates, more particularly applicable for use in electrical condensers. (Date applied for under Patents, &c., Act, 1883, sec. 103, Oct. 30, 1899, being date of application in Italy.)*

9,146. H. DEGENHARDT. London. Improvements in or relating to telephone systems and installations.

May 18, 1900.

9,169. W. LAWSON and CHAMBERLAIN & HOOKHAM (LTD.). London. Improvements in electricity meters.

9,181. W. F. JONES. London. Improvements in electrical apparatus.

9,186. W. DAVIES. Abercynon. An improvement on insulator and telegraph wire fastener.

9,200. F. HEIMEL. London. An improved dynamo-electric machine and driving gear for a vehicle.

9,203. The Hon. C. A. PARSONS and G. G. STOREY. London. Improvements in dynamos.

9,212. J. H. KILLIP. Liverpool. Improvements in or in connection with trolley or like current collectors for electric railways and tramways.

9,229. WILLANS & ROBINSON (LTD.) and G. L. ADDENBROOKE. London. Method of and means or apparatus for testing alternating current generators, transformers, meters and analogous apparatus.

9,233. M. WEINBERGER. London. Improvements in bayonet joint attachments for glow lamps, safety fuses, wall contacts, switches and similar devices.*

SPECIFICATIONS PUBLISHED.

NOTE.—All Specifications can now be obtained at the uniform price of 8d. each.

1899.

15,309. COLLEY. Insulating electrical conductors.

15,705. BARKER and EWING. Electric meters.

16,854. HALL. Connection fittings for various electrical purposes.

10,109. WILKINSON. Joint boxes for electrical installations and connections therefor.

10,153. WILSON, EVANS, and GODSAL. Method of controlling mechanisms by means of Hertzian waves.

10,671. PILKINGTON and ORMANDY. Utilisation of wrste sand from glass grinding works, and other materials for the manufacture of hones, holy stones, grindstones, and like blocks for abrasive grinding or polishing purposes, crucibles, emery, corundum, and other wheels, bath, fire, or other bricks, tiles, ornamental or other slabs, tablets, switchboards, imitation porcelain and pottery, and the like.

10,863. HOPKINSON. Switches for alternating electric currents.

12,731. HOLT and ATHERLEY. Electrical switches, particularly suitable for high-voltage connections.

13,118. ELLIS and CRICHTON. Mechanism for electrically driving roots and like blowers.

13,257. SMITH. Underground conduits for electric railways.

14,632. CHONÉ. Collectors for electrically-propelled vehicles.

14,704. BREMER. Electrodes for electric arc lamps.

COMPANIES' MEETINGS AND REPORTS.

City & South London Railway Co.

A general meeting of this Company was held last Tuesday under the presidency of Mr. CHARLES GREY MOTT.

Mr. W. F. KNIGHT (the Secretary) read the notice calling the meeting.

The CHAIRMAN said they had been so used in the past to meet half-year after half-year with an improving dividend that it had been a matter of very great disappointment to the Directors to have, as they had during the last two half years, to announce a decreased rather than an increased dividend. The only comforting thing was that they believed the decreased dividend was due to temporary causes, and when these were removed he believed that they would again be able to announce an increase in the dividend. Great efforts were made by the general manager and his staff to get the extensions open, and by means of hard work the extension to Moorgate-street was opened about March 1, and that to Clapham Common by June 1. But in order to accomplish this they had to submit to one or two questions of detail being in an imperfect condition. At first the engines at the generating station were not quite satisfactory, and the lifts at various stations were also not acting as they could have wished. He was glad to say that these difficulties were now overcome. They felt when they opened the extension last March, that whatever defects there might be with regard to the question as to the smoothness and convenience and regularity of the working of the lifts, they were, at all events, absolutely safe. However, the faith they had upon that subject was rudely shaken when one of the lifts at London Bridge broke down. The accident had arisen from a combination of circumstances which were never likely, he believed, to occur again in any shape or form. As the shareholders knew, they had worked that line for nearly 10 years without any accident to their lifts, and congratulated themselves upon that fact, and therefore they very much deplored the accident. The other lines of railway with which they hoped they would be connected and which they expected to bring them in traffic were not opened as early as they expected, but their most important connection, the Central London Railway, was on Monday last opened for public traffic. The subway from their own railway which connected the platforms of the two lines was now being used, and he believed that they would get, as soon as the public became aware of the convenience of the system, a very large accession of traffic passing through the subway between the Central London system and their own system at the Bank. The subway between their own line at London Bridge and the station of the L.B. & S.C.R. Co. was now being made, and that would prove another source of traffic as soon as they were able to open it, which he hoped would be within the next six months. The Baker-street and Waterloo Railway Bill had passed, with connections with Paddington and the Great Central Railway, and with a connection with the line of this Company at the Elephant and Castle, which would give them connection with a vast artery of traffic right through the best part of the West End of London, with connections with the north and with stations at Charing Cross, Piccadilly, Regent-street, and elsewhere in the best part of the West End, and there was no doubt that they would get a very large accession of traffic there. As regarded the extension to Islington the tunnels were now completed and there only remained to finish the stations—the underground stations, one of which was already done, and to build the surface stations, and to put in the lifts, and they hoped that the whole work would be completed by about next March. When the extension was carried out, they would be able to show what the capabilities of the railway really were. The main line would be completed, and he believed they would be able to show the shareholders that they had a good line and a good paying traffic. One of the reasons why they had a diminished dividend this time was that they had thrown out of use three-quarters of a mile of their line between the Borough and their old station in King William-street. That three-quarters of a mile of line was a valuable asset.

Digitized by Google

If that portion of the line had been worked by the Company, and they had received the receipts for their ordinary traffic upon it, they would have been in the position of being able to pay to the shareholders a dividend of at least 2 per cent. upon that occasion. They had approached the City and Brixton Railway with a view of coming to a slight modification of the agreement in order to enable them, if possible, under certain more favourable terms, to raise the money requisite for the construction of that line. The result had been an agreement whereby the City and Brixton Company should have a first charge upon the gross receipts up to an amount not exceeding 3½ per cent. instead of 3 per cent., the Directors to determine how much they would give between the 3 per cent. and 3½ per cent., and another alteration was that the City and Brixton Company were entitled to share for an additional amount after the City and South London Company had paid 3½ per cent. dividend instead of 4 per cent. as in the original agreement; and in addition, the agreement provided that the City and South London Company were to receive the income for the three-quarters of a mile of line which would go against any absolute loss which they might incur under the arrangement. That was what the shareholders would be asked to approve at the extraordinary meeting.

With regard to the accounts, on capital account they had received for calls on the last issue of shares £79,212, debenture stock sold £169,278, received for premiums £33,790, making a total of £282,280. Against that they had expended upon works and rolling stock £158,263, and interest chargeable to capital was £7,759, making a total of £166,022, leaving a balance outstanding of £126,258. The revenue accounts showed that they had an increase in the number of passengers carried of 629,619, and in the receipts of £6,934. Season tickets had decreased by 82, and in money by £76. In parcels there was an increase of £28; in transfer fees a decrease of £6; in rents an increase of £234; and in sundries a decrease of £96, so that the total net increase was £7,019. Expenditure showed a decrease in maintenance of £49, but there was an increase in locomotive and generating power of £1,727, carriage repairs £134, traffic expenses £2,946, general charges £85, passenger duty £43, law charges £4, rates and taxes £119, so that the net increase amounted to £5,009, so that they were left with a net increase of £2,010. The increased interest amounted to £626, making up a total of £2,636, and the decreased balance, £165, made up the amount of £2,801. The increased interest on debenture stock was £1,213, and the dividend on preference stock £3,333, together £4,546, less the £2,301, which made the amount available for dividend on the ordinary stock less by £1,745, and they had to pay upon £855,000 against £630,000, so that they could, only pay a dividend of 1¼ per cent., as against 2¼ per cent. He concluded by moving the adoption of the report and accounts.

Mr. C. S. GRENFELL seconded the motion.

In reply to a question, the CHAIRMAN said that the expense entailed in consequence of the accident to the lift would fall upon the contractors and not upon the Company.

A LADY SHAREHOLDER asked if there was any intention of extending the railway further than the "Angel," and suggested that they might go to the foot of Highgate Hill.

The CHAIRMAN said that the Board contemplated no further extensions at present.

In reply to Mr. Davidson, the CHAIRMAN said that the Board had come to an arrangement with the London County Council in re the Islington Station. The Company considered that they had been badly treated, but he understood from the solicitor that the whole matter was now settled.

The resolution was unanimously carried.

The dividends proposed by the directors were then approved.

At an extraordinary meeting which followed resolutions were approved ratifying the new agreement between the Company and the City & Brixton Company.

Votes of thanks to the Chairman and Board, the Secretary (Mr. Knight), the General Manager (Mr. Jenkin), and the staff of the Company closed the meeting.

Globe Telegraph & Trust Co. (Ltd.).

The twenty-seventh ordinary general meeting of this Company was held on 27th ult., under the presidency of the Most Hon. the Marquis of TWEEDDALE, K.T.

The SECRETARY (Mr. Sidney Collett), having read the notice convening the meeting,

The CHAIRMAN said: Gentlemen, I have now to ask your approval of the report and accounts. I believe that the report will be regarded as highly satisfactory. We are not able to recommend a larger dividend than last year, but our position has been well maintained, and we are paying the same enhanced dividend as we did last year. The receipts, after deducting all expenses, amounted to £198,420, showing an increase of £530, while the expenses—which are never large, amounting to only ⅛ per cent. on the capital of the Company—are somewhat less this year than they were last. We are able to recommend a final dividend of 4s. 6d. per share on the ordinary shares, or, in other words, after paying 6 per cent. for the year on the preference shares there remain funds available for a dividend at the rate of 5¼ per cent. net on the ordinary shares, leaving a balance of £982 to be carried forward. The dividend paid on the ordinary shares was in 1895 at the rate of 4⅛ per cent., in 1896 4½ per cent., in 1897 4½ per cent., in 1898 5⅛ per cent., in 1899 5¼ per cent., and we now maintain that increased dividend.

Turning to our investments, the first investment is the *Anglo-American Telegraph Co.*, and you will observe that for the first time our report shows that we hold none but preferred stock of that company, having sold the remaining £70,000 deferred stock at almost the highest price it has ever reached. The proceeds were invested in shares of the Brazilian Submarine Telegraph Co., now known as the Western Telegraph Co. The return on the Anglo-American preferred stock is £6. 11s. 6d. per cent., against £5. 5s. 11d. per cent. last year.

Commercial Cable Co.—We have increased our holding in this Company by 100 shares. Towards the end of 1899 the Commercial Cable Co. issued some new capital, which was offered to their shareholders at the rate of one-third of their existing holdings at par. We took up our proportion, which makes our present holding 400 shares, with the result that the average cost per share is reduced from £33. 16s. 8d. to £30. 10s. 7d., while the return per cent. per annum is increased from £4. 13s. 7d. to £5. 2s. 7d., the return on the 100 new shares being 8 per cent.

Direct United States Cable Co.—This company has benefited by the growing Atlantic traffic, and has increased its dividend from 3½ per cent. last year to 3½ per cent. this year, making the return per cent. per annum on this investment £6. 2s. 11d. against £5. 14s. 1d. in the preceding year.

Eastern Extension Telegraph Co.—This company has recently issued new share capital, which was offered to their shareholders in the proportion of one-fifth of the existing holdings at £13 per share, the market price at that time being £16. We availed ourselves of this offer, thereby adding 11,143 shares to our holding in that company. This investment has, of course, not as yet yielded any dividend, but assuming that the Company maintains the present dividend of 7 per cent., the investment will return to us £5. 7s. 8d. per cent. The cost of this purchase will be met by the sale of some other securities.

London Platino Brazilian Telegraph Co.—We have sold, during the year, 27 debentures in this company at a substantial profit, and have used the proceeds in the purchase of the Commercial Cable shares, to which I have already referred.

Submarine Cables Trust.—The increase in the income of the Submarine Cables Trust has enabled the trustees not only to meet the half-year's coupons, which, until recently, were somewhat in arrears, but also to provide a surplus sufficient to enable them to draw a certain number of certificates for payment at £120. It so happened that 10 of the certificates so drawn were held by this Company. The coupons of reversion, attached to those certificates remain with this Company, they will, however, earn no income, and it is not easy at the present time to assess or estimate their intrinsic value; but there is no doubt that when the Submarine Cables Trust comes to be wound up, these coupons will be of considerable value.

Western Telegraph Co.—This is the new name which has been adopted by what we have always known as the Brazilian Submarine Telegraph Co. The income for the year amounted to £26,124, against £22,805 last year, bringing the return per cent. per annum from £5. 12s. 6d. last year to £6. 8s. 11d. this year. The debentures formerly standing in the name of the Western & Brazilian Telegraph Co. have now been exchanged for 4 per cent. perpetual debenture stock of the Western Telegraph Co.

Our other investments, which I have not named, remain unchanged, and do not call for any special remarks. You are aware that the market price of most of the Submarine Telegraph Co.'s stocks has fallen during the last year or two. This is due partly to the experiments in wireless telegraphy which Mr. Marconi has been carrying on, partly to the proposed Pacific cable—or rather cables—and perhaps also to the general political outlook, which is not as reassuring as we should like it to be. Notwithstanding these adverse influences, the market price of our investments shows at the present day a very considerable surplus over the capital—a surplus, I think, amounting to just short of £600,000. With respect to the threatened Pacific cables, I understand that tenders have been invited for an all-British cable from Vancouver to Australia, vid Fanning Island, and will probably be sent in in a few weeks. Besides that, two bills are before the Congress of the United States for a cable connecting California with Honolulu and the Philippine Islands. One of these is designed to be under Government superintendence, and the other is intended to be under a private company. The rival schemes will in all probability be disposed of in the course of next December, when Congress resumes its sittings. I need not assure you that the utmost attention is being given to this important matter by the directors of the companies which will be affected by the establishment of a cable or cables in the Pacific, and I have no doubt that the directors will do their best to protect the interests of the several companies concerned.

I now move the adoption of the report and accounts, and the dividends as recommended.

Sir JAMES PENDER, Bart., M.P., seconded the motion, which was carried unanimously.

Resolutions were afterwards passed re-electing the retiring director, Sir James Pender, and the auditors, Messrs. Deloitte, Dever, Griffiths & Co., and Mr. John Newton.

A cordial vote of thanks to the chairman and directors terminated the proceedings.

Edison and Swan United Electric Light Co. (Ltd.).

The seventeenth ordinary general meeting was held on Tuesday, Mr. JAMES STAATS FORBES presiding.

The SECRETARY (Mr. H. Charles Gover), having read the notice calling the meeting,

The CHAIRMAN said: Gentlemen, before dealing with the accounts I wish to make reference to the stocks of goods at our various depôts. From year to year we have accumulated an enormous amount of stock in hand. We have London with several depôts, one or two very important ones. We have in a number of great towns and centres an increasing number of depôts, and from year to year that involves, with the growth of our business, the accumulation of a vast number of articles at these places. If they only grow something like in proportion to the amount of the turnover there is no occasion for alarm, but we have thought it necessary, with the concurrence of the auditors, to have a very serious

Digitized by Google

alteration in our stocktaking. Having been tolerably prudent and pretty careful hitherto, this stock has got so very large that it involves an enormous amount of labour. I forget how many articles there are in our big stock, and how many varieties of different kinds.

The MANAGER: About 75,000 to 100,000 varieties, and about 6,000,000 items. There are about 1,700 varieties of lamps alone.

The CHAIRMAN: You will see our business is made up of very small elements, but amounting in the aggregate to a serious one, particularly in respect of the stock on hand. We have to look to the possibility of fashions changing. It is not only that you have a great many articles, but some of them may be superseded by something better, and we came to the conclusion that we had better close the year after a stocktaking of a serious nature during the month of June, and earlier, which would really put us in something like absolute knowledge of whether the stock was present in valuable quantity to the extent shown in the books, and that has turned out to be rather a longer job than we expected. We have taken stock, and I think I can give you the assurance, as far as it has gone, that we have every reason to believe that the stock stated in the accounts as it stands is well within the actual saleable value from day to day. You will see by the report what the auditors say about it: "We have examined the balance-sheet, and find it to be correct and in accordance with the books and vouchers of the company. The stock having been taken on May 31, the profits of the month of June have been estimated on a basis which we approve." Since the report was prepared we have ascertained the exact value of the stock on hand, and as an asset of the company it is worth some few thousand pounds more than it was put at on May 31—£201,648.

Now, as to the report. We have already paid something in the nature of a provisional dividend for the first half of the year, and we propose to pay at the same rate for the second half, which will make a dividend of 6 per cent. for the year, and carry forward £6,199. The increased value of our stock means that the balance carried forward might have been £12,000 odd instead of £6,000 odd. The accounts show that we have largely increased the volume of the business, from £241,000 to £285,000, an increase of £44,100. On May 31, 1900, you will see the stock stood at £201,648. The figure last year was £160,000, and therefore the item has increased by £41,648. On the other side of the profit and loss account you will find depreciation of plant, &c., £13,936. This item has increased by £4,500 odd on the year, which means that having a very large stock and bigger business, we feel it wiser to write down a corresponding amount out of the profits. The salient points of the account are that the balance brought forward amount to £10,509; the business has increased from £241,000 to £285,000; the stock has increased from £160,000 to £201,000; and the interest accrued to us from investments and other sources has increased by about £1,100. Against that there is the fact that the stock in hand on July 1, 1899, was only £160,000; wages, purchases, &c., £272,112; salaries, remuneration of directors, income tax, insurance, and general and law charges, £12,076, which has not materially increased; depreciation on plant, &c., £13,936, and a balance of £43,388, against £44,792 last year. But if I add the £6,000 which is required to bring the value of the stock up to its right figure, you will see that the balance would amount to £49,398. Another matter affecting the balance is that this year we have had to spend a good deal of money in anticipation of this year, and have had to raise fresh capital. That capital has come into charge, increasing the item of interest. The increase is £1,994. It has cost us less to pay interest than to pay the bankers for loans, and we have got out of debt at our bankers and have a considerable surplus in hand to go on with. The rather heavy sums standing in the balance-sheet against sundry debtors and debit balances (£143,959) is largely accounted for by the fact that the estimates of income for the month of June is a debt to the company at this moment, because we give everybody long credit, and there is no collecting money for some time in respect of anything sold in the month of June. Therefore the amount authorised by the auditors to be brought into the accounts as the approximate income of that month is owing, and is brought in as a debt. That is a large amount, but, under the same pressure as other people who have to face competition, we have to meet the convenience of our customers. I am glad to say that hitherto our bad debts have been inconsiderable. I now move the adoption of the report and accounts.

Mr. J. WILSON SWAN, F.R.S., seconded the motion, which was carried unanimously.

Resolutions approving the dividends were then approved.

The CHAIRMAN then referred to an agitation that had been threatened by the "B" shareholders. He said that having some reason to believe that a combination existed of "B" shareholders he issued a circular sounding a note of warning and suggesting to the shareholders that they should not be in too great a hurry to part with their shares at a large discount. There was no reason why shareholders should part with their shares of any denomination at less than their par values. The fear that a further call would be made on those shares was an illusory one. There was no reason whatever why the company should not become even more prosperous than now. They had an enormous business in lamps, and a growing business. That business of lamps would go on, but besides that they were largely occupied in fittings and an infinity of things. They had the largest business in "special" lamps of any company in the world. Their fittings department was developing rapidly, and had, in fact, outgrown the machinery provided for it, and he was not sure it had not also outgrown the brains which had conducted it. They had reformed all that now, had added to the machinery, and were following the American idea of labour-saving appliances, under an exceedingly capable man, in whom they had great confidence—an engineer by profession of some ability and reputation. It was a profitable business.

Mr. James Staats Forbes and the Earl of Lichfield were re-elected directors, and Messrs. Welton, Jones & Co. were re-appointed auditors.

A cordial vote of thanks to the chairman, directors and staff terminated the proceedings.

Rand Central Electric Works (Ltd.).

The annual general meeting was held on Tuesday, Sir CHARLES RIVERS WILSON, G.C.M.G., C.B., presiding.

The SECRETARY (Mr. H. Militz) having read the notice calling the meeting,

The CHAIRMAN said: Gentlemen, I have to repeat the apology I made to you last year, but under somewhat different circumstances, for the late period at which we have summoned you for the annual meeting. But you will not be surprised when you recollect that circumstances beyond our control have made it very difficult for us to communicate with our people at Johannesburg, and to obtain the documents to enable us to prepare the report and accounts. This is a contingency which I sincerely trust will not be repeated. Before going into the question of the state of the works and the conditions under which we have been working in consequence of this disastrous war, I will just cursorily examine with you the accounts. Taking first of all the debtor side of the balance sheet, we have fulfilled our obligations by setting aside the small sum of £83. 19s. 9d. to the reserve fund, being 10 per cent. of the profits made, which is all we were able to do. I do not think there is any other item on that side of the account which calls for notice. On the other side I think the items which will chiefly interest you are the amounts set aside for depreciation. You will recollect that the equipment contract contemplated that the amount of depreciation to be provided should be £16,200. That estimate, however, was based on the assumption that the whole of the full load of 2,100 H.P. would be in continuous running. Well, that of course has not been the case, and therefore we have dealt with the depreciation on the same principle as we did last year. Last year the amount appropriated was about £8,000, being 50 per cent. of the estimated amount provided in the equipment contract, and this year we have provided 75 per cent., making a total of about £12,500. There are certain items on the credit side for which no depreciation is provided, therefore we were not able, even if we had wished to do so, to set aside any such amount for depreciation. Now that we are beginning this year to be relieved from our obligations to Messrs. Siemens & Halske it will be open to us, if times are good and the circumstances warrant it, to take into consideration what we shall do in the direction of setting aside depreciation for the separate items to which I have referred. Well, now, I have no doubt that you have examined the report, and have observed the fatal influences of the state of hostilities from which we, like all other industries in South Africa, have been suffering. Instead of a very considerable improvement in our revenue, as contrasted with the last two years, we have made but slight progress, and nothing to be compared to what we had anticipated. In 1897 we worked at a loss of £16,000, although I am bound to say that the power supplied only covered a part of the financial year. In 1898 our loss was £5,472, and last year, working under favourable circumstances for nine months and extremely unfavourable circumstances for the last three months of the year, we have come out on the right side with a small profit of about £840. In view of the special circumstances which are attending our Company and its operations at the present moment, I think that the state of things justifies the expectation which your Directors have always held out to you, that we should progress steadily and satisfactorily, and I consider that under the circumstances to which I have alluded the result is entirely satisfactory. Under the equipment contract to which I have referred, our contractors, Messrs. Siemens & Halske, guaranteed a dividend of 6 per cent. for the year 1897, 8 per cent. for 1898 (both of which dividends were paid), and 10 per cent. for 1899. Upon the first blush of the thing the shareholders may not unreasonably have expected to receive the dividend of 10 per cent.; but Messrs. Siemens & Halske advanced a claim which I am bound to say in morality, and I think very likely it may turn out in strict legality, to be a well-founded claim—viz., that some consideration should be shown and some relief should be given them in respect of the last three months of the year 1899, during which period the works, if not absolutely stopped—because that has never been the case—were working at a vastly decreased output in consequence of the war. In these circumstances and guided by other considerations which I need not perhaps very minutely enter into, your Directors and the local Board have unanimously arrived at the conclusion, after very grave consideration of the subject, that there is room for a compromise with Messrs. Siemens & Halske, and the result has been that an arrangement has been agreed upon, as explained in the report. Messrs. Siemens & Halske entirely understand that the arrangement which we have entered into is to be entirely subject to the decision and approval of the shareholders. If you do not see your way to agree with the view so strongly entertained by the London and the Johannesburg boards the responsibility will rest with yourselves, and the consequence will be that we shall enter upon a period of most undesirable litigation with Messrs. Siemens & Halske. The basis of the arrangement proposed is this: We assume that the revenue in the December quarter is £16,230. 12s., that being the actual amount of the revenue for the September quarter. We then deduct the revenue actually received in the December quarter, amounting to £6,365. 7s. 2d., and we further deduct the difference between the actual working expenses in the December quarter and the working expenses in the September quarter, amounting to £2,493. 11s. 3d. Those two items make a total of £8,859. 18s. 5d. which, deducted from the assumed revenue of £16,230. 12s., leaves a net loss in the December quarter of £7,371. 13s. 7d. The proposition of the Board is that you shall agree with us in relieving Messrs. Siemens & Halske of that amount. The total amount which would be payable by them under ordinary circumstances would be £29,244. If you see your way, as I said before, to agree to our proposal, that amount of guaranteed money would be reduced by the sum I stated just now—

Digitized by Google

£7,371, and leaving their liability £21,872 instead of £29,000. The long and short of it all is that instead of getting a 10 per cent. dividend, which we all of us hoped might have been declared, and which which would have been paid but for this unfortunate political disturbance, the amount available for distribution will only be 7¼ per cent., after paying which we shall be able to carry forward a few hundred pounds to next year. I think it only right to mention that we have had two or three letters from shareholders deprecating any reduction in the amount of the guarantee. If they are here, perhaps I have anticipated what they may have to say, as possibly the explanations which I have given may induce them to change their views. As regards the actual position of our undertaking, you will perhaps, first of all, be interested to hear that during the war our works have been maintained in a very efficient state. No harm has been done us, and there has been no interference with our works, so far as I know. I think it only right that I should pay a tribute to our local chairman, Mr. Brakhan, and to our general manager, Mr. Gorrissen, and the staff on the spot, who have stayed by us throughout all these troubles. They have never left their work, and have kept all our works out there in most admirable order and ready to take up the work of the increased number of customers which we hope to have as soon as the war is over. It will interest you to hear that some time before our troops reached Johannesburg we received a confidential intimation that it was in contemplation in certain quarters to destroy the mines by means of a communication from some central point on the farm Brakpan, the headquarters of our works. We lost no time in putting ourselves in communication with our friends at Johannesburg. It caused us a considerable amount of trouble, but we achieved our purpose, and our property was secured. Otherwise everything has gone on very quietly and smoothly. When the war began we were in the happy position of having a steady increase of consumption. At that time the amount of power absolutely supplied—that was at the end of September—rose to 1,541 H.P., which was the maximum up to that time. The average load in the preceding year had only been 965 H.P. I mention that as indicating to you the steady progress of our output and increase of our consumption. Our prospects are as good as ever they have been. Notwithstanding all these troubles—or perhaps in consequence of these troubles, because I daresay our engineers had more time on their hands than they otherwise would have had—the efficiency of the works has gone on increasing and improving in such a manner that as soon as the war is over and we are again able to resume our full operations, we shall be in a position to do most excellent and profitable work, and on a much larger scale than we have done hitherto. Before I sit down I must allude with great regret to certain serious and deplorable losses which the Company has sustained. In the first place, we have lost Mr. Charubin, who is intimately connected with Messrs. Siemens & Halske. Mr. Charubin has returned to Germany. Our other two losses—one a member of the Board and the other a gentleman intimately connected with our Company, in which he was deeply interested—are of a different character. Mr. Barsdorf was one of our original Directors, and we lost by his death a man who had your interests very much at heart. Then within the last 24 hours we have received intelligence of the death of Mr. Adolf Goerz, the managing director of Messrs. Adolf Goerz & Co., and who was also a member of the South African Board of the Rand Central Electric Works. I cannot say how deeply I regret the loss of two such excellent supporters. One of the vacancies has been filled by the appointment of Mr. G. von Chauvio, a gentleman well known to most of you by name, and I think you may congratulate yourselves on having a Director who will take an intelligent interest in your affairs. I now move the adoption of the report and accounts.

Mr. ALFRED H. MÄRKER seconded the resolution.

Mr. SIGISMUND CAHN said he objected to the item in the profit and loss account, "Wages and stores at works, £22,286." According to the basis of guarantee stated in the German prospectus which he received in Berlin, the working expenses for the full capacity of the works were £15,200. Now making allowance for the partial inactivity of the works the working expenses ought not to exceed £13,500. This excess of working expenses meant in the future about 6 per cent. less profit for the shareholders, if any. On behalf of himself and other shareholders he demanded that the contractors should not be allowed any abatement on the guaranteed dividend, and he further asked that the Chairman adjourn the meeting to Sept. 15, in order to give the 1,300 shareholders living in Germany an opportunity to record their votes. He understood that for every £10,000 of additional revenue they had £2,500 additional working expenses.

The CHAIRMAN: I cannot agree to any adjournment. It certainly has turned out that the amount charged for wages and stores at the works has exceeded what was contemplated by the contract, but you must bear in mind one or two things. In the first place I think those figures were based on the assumption that there would be continuous working, whereas, in full reality, it has proved to be very far from being the case up to the present time. In the second place, you have not taken into consideration the labour question, which has given us and other interests out there so much trouble, and which I have no doubt was one of the disturbing influences in regard to the matter.

Mr. ALFRED H. MÄRKER said: In reference to the point that the working costs had exceeded the estimate, it was unfortunate in all undertakings they had always something to learn. Messrs. Siemens & Halske based their estimates upon the experience which they had gained in many tropical climes, but that experience did not tally with that gained in South Africa. The fact of the matter was that not only had Messrs. Siemens & Halske lost a considerable amount over this business, as shareholders could see for themselves, but he could also state that the amount of loss was greater than was apparent from the annual profit and loss accounts, but with men and money they had done all they could to help the Directors in seeing the Company through all its difficulties, and they were still standing by them, although their contract was up. He could assure them that Messrs. Siemens & Halske had done nothing else than protect the interests of the shareholders.

The resolution was then carried.

The dividend of 7¼ per cent. was then approved, and the retiring Directors (Sir C. Rivers Wilson and Mr. G. Zwilgmeyer), were re-elected, and the auditors (Messrs. Price, Waterhouse & Co.) reappointed. A vote of thanks to the Chairman and Directors brought the proceedings to a close.

Marconi International Marine Communication Co. (Ltd.).

The statutory meeting of this company was held on Wednesday, Major S. FLOOD PAGE presiding.

The SECRETARY (Mr. H. W. Allen) having read the notice convening the meeting,

The CHAIRMAN said he could not commence the proceedings without referring to the truly tragic event which had happened in Italy. He had heard Mr. Marconi say how greatly he had been indebted at the commencement of his work to the kind assistance, help, and consideration tendered to him by the King and Queen of Italy, and this must be his excuse for introducing the subject on that occasion. He had to apologise for the absence of the president of the company and many of their foreign colleagues, but M. Maurice Travailleur, manager of the company in Brussels, was present. They would remember that the prospectus of the company contained a list of names of gentlemen of the highest standing, experience, and financial position belonging to almost every country in Europe as forming the board of directors, and it was to these gentlemen that the shareholders would look to do the business of the company. This business was practically limited to ship-to-ship, shore-to-shore, ship-to-shore, and shore-to-ship communication. They had already made a commencement in Belgium. A site had been determined upon for the erection of the first Marconi mast in that country, and a Belgium steamer was to be fitted with the apparatus. The directors anticipated that an arrangement would be come to with the Belgium authorities by which the Marconi system would be working all along the Belgium coast. Their French directors had approached the French Government and were about to enter into negotiations with a view to obtain concessions for the Marconi Company in France. Senor Prendergast, who was also one of their directors and at one time Minister of the Colonies in Spain, had commenced negotiations with the Spanish Government with a similar object. The London offices were in communication with Newfoundland with a view to establishing stations there. It was true the company had not yet done very much, but it was impossible with a system such as theirs to set to work immediately the company was formed, more especially as a telegraphic monopoly existed in almost every country of the world. Their difficulty was to persuade the Governments who held these monopolies that the company was going to help them and not to trade against them, and that if they succeeded in doing their business they would increase the Governmental revenue. It was necessary that he should give a word of caution to the shareholders here and abroad with regard to rumours concerning other systems of wireless telegraphy. It was quite true there were other systems, but it was also quite true that none of them were successful. One thing was clear, that none of these systems could be worked with any degree of success without using Marconi patents in one form or other, and the question was how long their parent company should allow these infringements to continue. Litigation might be necessary, but it was first of all desirable they should find out whether their opponents were worth powder and shot. They were established, however, to earn dividends, and the way in which they must set to work to do this was, as he had said, to persuade Governments with which they would have business relations that they were not competitors with them for telegraphic business, but that if they were allowed to put up poles on the shores of foreign countries the Marconi Company would undertake before long to have the Marconi system on ships, by means of which communication could be carried on, and business would accrue to the Government telegraph systems in that manner. They had no difficulty whatever with regard to money; the shareholders in the Marconi Wireless Telegraph Co. had had the opportunity of taking up a large proportion of the shares and they had done so. He must say one word as to the opposition of the Post Office and what this opposition amounted to. He did not believe that if they had a Marconi mast and apparatus fixed in England that any Post Office or any department of the Government could prevent them from communicating with the post they had erected at Belgium. The Post Office claimed a monopoly, but to his mind it was iniquitous that (taking the case of the National Telephone Co., which paid the department £68,000 for royalties in six months) private companies should be treated as that company was being treated. Then again, the District Messenger Co. was another case in which the Post Office was in conflict. This Post Office monopoly simply rested upon the decision of two judges (Justices Pollock and Stephens), which was not a strong court. Both these judges were dead. They had read into the Telegraph Act the telephone system, which did not exist when the act was passed. The telephone company had been urged not to appeal against this decision. The Post Office said: "Do not appeal and we will give you a long licence," and the result of possessing that licence was that to-day the company was crippled to the extent of £130,000 per year, which they paid in royalties, and were now threatened with Post Office competition. The Marconi company could work in defiance of all the Post Office authorities in the world, who could have no legitimate grounds for interference with the company's operations in any way whatever. If the company fitted their system on to a ship and that ship traversed up and down the English coast, it could speak to half-a-dozen stations without interference by the Post Office so long as the ship was 3 miles and a yard away from the coast, and the onus of proof of the 3 miles and a yard lay with the Post Office and not with the ship. They did not want to quarrel with the Post Office

Digitized by Google

but at the same time they had no intention of being bullied. He thought he might be permitted to say that the Marconi Company had the sympathy of some of the highest Government officials in this matter. He would give them one instance of this Post Office interference, which he regarded as simply monstrous. They had entered into an arrangement with the South-Eastern and Chatham Railway Co. to obtain the best instruments possible for communication between their ships and the shore. That company carried over 400,000 passengers a year in their ships, and had not lost a single life since 1863, and the Directors were alive to the value of wireless telegraphy. He had asked the manager of the railway why the matter had not proceeded, but was unable to discover whether the block lay with the French Post Office or with the English Post Office, or whether some clauses of the Postal Union Convention prevented their working. He held that it was simply monstrous that English industries should be hampered in this way by the bugbear of a Government monopoly, which, if it had been fought, would, he had legal authority to say, have no longer existed. He had one good thing to tell them, which was that the Marconi Wireless Telegraph Co. had entered into a contract with the English navy, which, if successfully carried out, would stamp the Marconi system once and for all, so that no one could question its merits and advantages. The contract provided that there should be 32 ships or torpedo stations fixed up with the Marconi apparatus, but they did not know the date when they would have to commence their work. The work they had to carry out was a difficult one. A ship was to be fitted at Portsmouth, and another at Portland, and these were to communicate one with the other. It was a long distance, and there was a high range of hills between the two places. They had had the Marconi apparatus at Delagoa Bay on four of Her Majesty's ships for several weeks, and in no case had it failed to give satisfaction. The Portuguese Government at Lourenço Marques were carrying out an installation, and they were expecting full details daily. He wished to impress them particularly with the fact that the Marconi system had never failed where it had been properly carried out. There was, he said, no business to transact that day, and, having thanked the shareholders for their attendance he declared the proceedings closed.

Anglo-American Telegraph Co. (Ltd.).

The half-yearly meeting of the proprietors was held on 27th ult., Mr. FRANCIS A. BEVAN in the chair.

The SECRETARY (Mr. T. H. Wells) having read the notice calling the meeting,

The CHAIRMAN stated that the ordinary receipts for the past half-year to June 30 had been remarkably similar to those for the corresponding period of 1899. There was a difference of only £983 in favour of the past half-year, and he thought that, so far as their ordinary traffic was concerned, they might congratulate themselves that they had not only maintained but had also increased their receipts. It must be remembered now that so far from the company or the associated companies having a monopoly of the Atlantic traffic, when the new German-Azores cable was opened there would be no fewer than 13 cables across the Atlantic. The competition was therefore becoming daily greater, and under those circumstances he thought it very satisfactory that they had been able not only to maintain but to increase their ordinary traffic; and he might state that for the present month the receipts were almost precisely what they were for the month of July, 1899. There had, however, been a large falling off in the earnings of the repairing ship "Minia." On a previous occasion, however, he warned them that the amount earned by the "Minia" was not to be relied upon—that, in fact, it was entirely exceptional, having arisen in consequence of the misfortune of their allies. Last year the company earned by the "Minia" over £19,000, while this year this amount was reduced by £17,975. This alone accounted for the diminished amount they were able to carry forward. Of course this was a matter over which the directors had not the least control, but there was something to be said on the other side in the extremely good working order of the cables. There was a large reduction in the amount owing to the company—a reduction of £57,000, but a good deal of the large amount of £12),000 shown last year was owing by the Western Union Company on account of repairs, and other items had also diminished the amount due to the company this year. There was an increase of £22,454 in the item of cable in stock. Owing to the repairs which were effected in the previous year their stock of cable had been brought down to a dangerous limit, and a large amount of spare cable had therefore had to be purchased. They had had for many years a cable running from Salcombe to Brest, but it had become very much worn, and they had therefore put down a new cable—not between these two places, but between Cuckmere and Havre, and they believed this cable would prove a great source of economy. In the revenue account there was an item of £83 for "damages recovered for injury to cable" in Valentia harbour. This was a very unusual entry. The directors thought the time had come when they ought really to make an example of a certain firm which had been particularly careless with their hulks in Valentia Bay, and brought an action, the net amount coming to them from the action being £83. With regard to the new German-Azores cable, the directors were informed that the new cable was to be opened on Sept. 1 next. When it was opened it would, of course, take a very large portion of the outward traffic, at all events, from Germany to America, and nothing which the directors could do could possibly prevent this. The cable was heavily subsidised by the German Government, and the line would no doubt be a very good one. There were only two collecting companies in America—the Western Union and the other American company, which was in partnership with the Commercial Cable Co. The Western Union Company, he believed, would be able to collect a very large portion of the German traffic coming this way, and whatever that company might collect would be carried over their own lines, or would be handed to the Anglo-American Company. It must, therefore, not be supposed that with the opening of the new cable the company were going to lose all the traffic; on the contrary, he hoped that they would retain a considerable portion of it. With reference to the old subject of the "P. Q." lawsuit, the solicitor desired that the proprietors should not press him on this point on the present occasion. Matters were going on, although very slowly, and what the result would be he could not predict. He concluded by moving the adoption of the report and accounts to June 30 last.

The DEPUTY CHAIRMAN (Sir Gerald Fitzgerald, K.C.M.G.) seconded.

Mr. EDWARDS enquired the total amount of German business involved.

Mr. WOOD desired to know if all the cables were working satisfactorily; he did not mean as regarded breakages, but whether the older cables were working in the manner the directors could wish, without hindrance.

The CHAIRMAN said the German business altogether was not a very large proportion of the whole. Their cables were working thoroughly satisfactorily. He understood the Commercial Cable Co. were going to lay another cable.

The motion was unanimously adopted.

A vote of thanks to the chairman and directors terminated the proceedings.

Crompton & Co. (Ltd.).

The twelfth annual meeting was held on Monday under the presidency of Mr. JOHN TROTTER.

The SECRETARY (Mr. E. Reeves) read the notice calling the meeting, and the report and accounts were taken as read.

The CHAIRMAN said he could congratulate the shareholders upon the results of the year's working. The company had returned to a state of prosperity, which he hoped and believed would last. The net profit earned had been £31,326 against £23,000 last year. The gross profits had amounted to £65,891, against £53,352. They had done a much bigger trade and had made larger profits also. The total of the working expenses altogether amounted to £35,564, equal to 54¾ per cent. of the gross receipts. For the previous year the percentage was 56¾ per cent. The figures for 1896 showed ratio of expenses to gross receipts 77½ per cent., 1897 72½ per cent., and 1898 67 per cent. In his opinion these expenses ought to be got down to 50 per cent. in the near future. The most important matter of the period under review had been the issue of new capital. The capital of the company amounted to £162,000, less £777 for unpaid calls. The shares were offered in the first instance to the existing shareholders at a premium of 5s. per share, and a very large number were taken up. The balance was issued to shareholders or the public at £3. 10s., or a premium of 10s. per share. The whole of the premium on the issue of the 21,902 shares had been carried to reserve. The available balance to be dealt with was £24,637, and out of this the directors proposed to set aside £2,500 for doubtful debts, to place £12,000 to reserve (raising it to £25,046), to pay a dividend at the rate of 9 per cent. per annum for the half-year, free of tax, making, with the interim 7½ per cent. for the year, carrying forward £3,729. The board proposed to set aside from the reserve fund £5,000 as a special contingency fund to provide for any shrinkage of value in the investments, to write £5,000 off goodwill. £5,000 from patents, and £3,000 balance for establishing the electric cooking department, carrying a balance of £7,046 forward. Having alluded to the improved position and prospects of the Chelmsford Electric Light Co., he said that the order book of Crompton & Co. was very full indeed, and they looked forward with considerable confidence to the future of the company.

The report and accounts were adopted.

Liverpool Overhead Railway Co.

The report of the directors for the half-year ended June 30 states that the gross receipts amounted to £38,124. 1s. 2d., and the working expenses to £25,113. 3s. 9d. The total passengers carried numbered 4,687,862, compared with 4,475,279 in the previous June half-year. The company's bill for powers to extend the main line to the Seaforth Station of the Lancashire and Yorkshire Railway awaits Royal assent. The capital authorised at the last meeting was offered to the shareholders, in 5,000 ordinary £10 shares at £8 per share, and applications were received for considerably more than the amount required. After deducting debenture interest and adding £4,591. 14s. 7d. from December there is £14,202. 12s., out of which it is recommended that dividends at the following rates (less tax) be declared: 5 per cent. per annum on the preference (£3,000) and 3 per cent. per annum on the ordinary shares (£6,750), leaving £4,452. 12s. to be carried forward.

ALUMINIUM CO. (LTD.)—At the annual meeting of the company the chairman (Sir Henry Roscoe) said the directors had entered into an agreement with the Cassel Gold Extracting Co., whereby an interchange of a portion of the profits of the Aluminium Co. and the profits of the Cassel Company had been arranged. If the amalgamation was carried through, in addition to the dividend of 15 per cent., the shareholders would be participating in the profits of the Castner-Kellner Alkali Co., in respect of three of their shares for every share the proprietors held in the Aluminium Co. from March 31; and assuming that the Castner Company continued to pay at least 8 per cent. per annum, the shareholders would actually receive for the 12 months' working within a trifle of 17½ per cent. per annum on each £1 share. The Aluminium Co. would be wound-up. The directors were satisfied that sodium could be made very much cheaper at the works of the Castner Company than at their own works. Resolutions approving the proposed amalgamation were carried.

CENTRAL LONDON RAILWAY CO.—The report of the directors for the half-year ended June 30, states that the expenditure for the half-year

Digitized by Google

amounted to £185,712. 6s. 4d., the total to June 30 being £3,353,596. 13s. 4d. The directors hoped to be able to open the railway for traffic in the early part of July, but their expectations were not fully realised, some modifications in the plant being found necessary during the experimental working. The approval of the Board of Trade having been given, the railway was opened for traffic on Monday, July 30. As a commencement a week-day service of trains is being run from about 5 a.m. to 12 p.m. at intervals of 5 minutes, but more frequent trains will be provided, especially during the busiest hours of the day, as soon as practicable. A reduced service will be run on Sundays.

CHILI TELEPHONE CO. (LTD).—The eleventh annual report of the directors of this company (to March 31) states that the aggregate number of subscribers at all centres at the end of the year was 4 613, compared with 4,486 at the beginning, a gain of 127. The gross revenue in Chili from all sources was, in 1899-1900, $551,436, and in 1898-99, $599,994, and increase of $51,442. The expenditure in Chili was, in 1899-1900, $364,549, and in 1898-1899, $375,230, a decrease of $10,681. The net income in Chili from all sources showed an increase of $62,123. The average rate of exchange for the year was 15·17d., compared with 14·27d. in the previous year. Converted into sterling at these rates, the net income represented an increase of £4,764. The balance to credit of revenue (including £448 brought forward) is £12,847, of which £3,044 has been carried to reserve for depreciation and renewals. The directors recommend a dividend of 4s. per share, free of tax (at the rate of 4 per cent. per annum), absorbing £8,800, and leaving £1,033 to be carried forward. During the year capital outlay in sterling was £1,798. The total mileage of lines on March 31 was 8,298 miles 990 yards, an increase of 233 miles 477 yards over the previous year.

DUBLIN UNITED TRAMWAYS CO. (LTD.)—The half-yearly meeting was held at Dublin on Tuesday. The chairman (Mr. W. M. Murphy) said the gross receipts were £12,000 more than in the corresponding half-year of 1899, and the working expenses £4,342 less. The net profits were, therefore, £16,742 more, £23,277 last year and £40,118 this, an increase of over 70 per cent. The net earnings of the Southern District Co.'s line were practically the same as the corresponding half-year, so that the whole of their increased profit was due to the conversion from horse to electric traction of the city lines. Their increased profits had had to meet increased wayleaves, together with increased interest, the total being £10,289 against £6,439 last year. They were able to declare a dividend at the rate of 7 per cent. per annum on the ordinary shares, an increase of 2 per cent. compared with last year. They had not yet arrived at the most economical basis for the production of electrical current, owing to the delay in the delivery of the polyphase plant. They had to keep Ballsbridge station open for the present, but when they shut it down and supplied all the current from Ringsend that would represent the saving of £2,400 in a half-year. During the last half-year they carried on the Dublin United Tramways system alone (excluding the southern district) 17,943,000 passengers, against 8,251,000 in 1891. At an extraordinary meeting which followed, the directors were authorised to increase the borrowing powers of the company by £300,000 in second debentures.

METROPOLITAN RAILWAY CO.—At the half-yearly meeting the chairman (Mr. John Bell) referred to the question of working the Inner Circle electrically. Their consulting engineers had stated that the experimental train was working satisfactorily. Other and important steps had been taken consequent upon their reports and the results of the experiments made by themselves at Wembley Park. It might possibly appear that too long a time had been spent upon these experiments, but the difficulties to be surmounted were greater than many people supposed. It was not a new railway they had to deal with, but a railway constructed for steam traction and carrying at the present time about 100,000,000 passengers per annum. That enormous traffic must be worked without a hitch so far as human means could provide while the change from steam to electric traction was being made. They also had to deal with traffic of other railway companies, which was brought on to and worked over a portion of the Inner Circle lines. The directors were, however, sanguine that those difficulties were capable of being overcome. The directors were convinced that electric traction had now so far advanced, and was so much better understood than it was even a few years back, that the new means of traction was practicable for working the circle, and they were determined to do all in their power to make the change as quickly as possible. They believed that the best and most practical knowledge of electric traction was centred in the leading electric traction firms, and what the board proposed therefore to do—and they were acting in concert with the District Company—was to ask some of the most eminent firms to submit their views as to the best method or system to adopt for the working of the circle, and invite them to submit offers, with plans and specifications, for the installation.

NOTTING HILL ELECTRIC LIGHTING CO. (LTD.)—An extraordinary meeting was held on Wednesday to consider resolutions increasing the capital of the company to £200,000 by the creation of 10,000 new shares of £10 each to rank as ordinary shares, and providing that 2,200 of the new shares be issued at a premium of £2 per share—1,100 to be offered *pro rata* to the holders of the founders' shares and the remaining 1,100 *pro rata* to the holders of the ordinary and ordinary preference shares, the remainder of the new shares to be issued from time to time at the directors' discretion in the same proportions to the holders of the founders', ordinary and ordinary preference shares. Sir Wm. Crookes presided, and stated that the resolutions were the outcome of a meeting held between representatives of the holders of the different classes of shares in the company. In answer to a shareholder, the chairman said that although the shares would be issued in the proportions mentioned it did not follow that they would be necessarily issued at the present premium of £2. The resolutions were carried.

WATERLOO AND CITY RAILWAY CO.—The directors' report for the half-year ended June 30 states that the capital outlay to June 30 was £589,073, 6s. 4d. The gross receipts, less Government duty, amounted to £14,133. 0d. 6d. From this the London and South-Western Co. have retained £5,398. 2s. 9d. in respect of working expenses, leaving £8,734. 17s. 9d. payable by them, in order to provide the agreed dividend at the rate of 3 per cent. per annum on the company's ordinary and borrowed capital. This dividend is payable on August 11. The number of passengers carried during the six months, exclusive of season ticket holders, was 1,868,737, an increase of 152,912 over the corresponding period of 1899. The season ticket holders numbered 911, against 747 at June 30, 1899. The following number of passengers carried (exclusive of season ticket holders), and the traffic receipts for each half-year since the opening of the line, were as under:—

	Passengers.	Net receipts.
December 31, 1898	1,442,855	£10,883
June 30, 1899	1,715,825	12,815
December 31, 1899	1,769,731	13,214
June 30, 1900	1,868,737	14,070

NEW COMPANIES, STATUTORY RETURNS, &c.

GARDNER ELECTRIC DRILL AND HAMMER CO. (LTD.)—This company was registered on July 28 with a capital of £40,000, in £1 shares, to acquire and turn to account inventions relating to electric power rock drills and electrically-operated hammers, and to carry on the business of electrical, mining and general engineers.

HARWICH ELECTRIC LIGHTING AND TRAMWAYS CO. (LTD.)—This company has been registered with a capital of £50,000, in £1 shares, to acquire the Harwich (Corporation) Electric Lighting Provisional Order (1892), and to carry on the business of tramway and light railway proprietors and of an electric light and power company in all its branches. The subscribers are G. E. Heyl-Dia (electrical engineer), G. Leve, W. W. Norman, W. J. Forsham, A. W. Howard, T. Burton, and J. Mason.

C. V. LAMP SYNDICATE (LTD.)—This company was registered on July 26, with a capital of £14,000 in £1 shares, to manufacture and deal in electric and other lamps, and to carry on the business of an electric light and power company in all its branches.

METROPOLITAN MOTOR MANUFACTURING CO. (LTD.)—This company was registered on July 28 with a capital of £10,000, in £1 shares, to acquire certain inventions from Messrs. A. E. Creese, F. Jackson and T. Underwood, and to carry on the business of electrical and general engineers, motor car manufacturers, &c. The first directors are A. Johnston, F. Jackson, T. Underwood, and another to be appointed by the subscribers.

CALCUTTA ELECTRIC SUPPLY CORPORATION (LTD.)—The annual return to May 25 gives the capital as £200,000, in £5 shares, 20,000 of which have been taken up. Notice of increase of capital to £300,000 was filed on June 8.

TELEGRAPH MANUFACTURING CO. (LTD.)—The annual return to June 15 has been filed. The capital is £300,000, in 40,000 preference and 20,000 ordinary shares of £5 each, of which 20,000 preference and 20,000 ordinary have been taken up. £5 has been called up on each of 15,400 preference and 13,400 ordinary shares, and £134,000 has been received. £66,000 is considered as paid on 6,600 preference and 6,600 ordinary shares.

CITY NOTES.

MEMORANDA.—Bank rate 4 per cent. (since July 19, 1900). Price of silver 28d. per oz. (Aug. 2). Consols (2¾ per cent.) $97\frac{7}{16}$—$97\frac{7}{8}$ for money; $97\frac{9}{16}$—$97\frac{11}{16}$ for account; 2½ per cent. 96—96½ (July 26). Stocks and Shares Continuation Days, Aug. 13 and 28; Ticket Days, Aug. 14 and 29; Pay Days, Aug. 15 and 30; Mining Share Carry-over Days, Aug. 11 and 27.

ACTIENGESELLSCHAFT BROWN, BOVERI & CO., BADEN, SCHWEIZ.—This is the title of a company which has been formed with a capital of 12,500,000m. (about £625,000), to take over the business of Brown, Boveri & Co.

BLACKPOOL AND FLEETWOOD TRAMROAD CO. (LTD).—The directors recommend a dividend of 4 per cent. for the half-year ended June 30.

BRITISH ELECTRIC TRACTION CO. (LTD.)—Mr. C. Shirreff Hilton has joined the board of this company.

BRITISH NORTH BORNEO CO.—At the annual meeting on Tuesday the chairman (Mr. R. B. Martin, M.P.) announced that the telegraph system was still being extended, about 350 miles were working, and another 100 miles were in course of construction. The traffic so far had not been great, but the telegraph was invaluable to the Government, and more than paid for itself as a utilitarian and economic work. During the Mat Salleh rebellion it practically saved the situation, and it had also been of the greatest use in the construction of the railway.

Digitized by Google

BROMPTON & KENSINGTON ELECTRICITY SUPPLY CO. (LTD.)—The directors have declared an interim dividend at the rate of 7 per cent. per annum on the preference shares, and an interim dividend of 5 per cent. per annum on the ordinary shares for the half-year ended June 30, payable 8th inst.

BRUSH ELECTRICAL ENGINEERING CO. (LTD.)—An interim dividend on the 6 per cent. preference shares for the half-year to June 30, payable 1st prox., has been declared.

GERMAN ELECTRICAL INDUSTRY.—It is stated that in 1896 the capital invested in German electrical enterprise was 240,000,000 marks, while on Dec. 31, 1899, this capital exceeded 700,000,000 marks (about £35,000,000). Before 1890 only three great electrical companies were founded in Germany. The average dividend of 14 electrical companies for 1898 has been returned at 9·3 per cent., the highest being 15 and the lowest 4 per cent.

W. T. HENLEY'S TELEGRAPH WORKS CO. (LTD.)—Interim dividends for the six months ended June 30 will be paid on Sept. 1, as follows: On ordinary shares at the rate of 8 per cent. per annum, and on preference shares at the rate of 4½ per cent. per annum, less tax in each case.

METROPOLITAN ELECTRIC SUPPLY CO. (LTD.)—An interim dividend of 6s. per share for the half-year ended June 30 has been declared. The transfer registers will be closed from 4th to 13th inst. inclusive.

RAND CENTRAL ELECTRIC WORKS (LTD.)—Mr. H. Rogers has been appointed secretary of this company in place of Mr. H. Militz, resigned.

STOCK EXCHANGE NOTICES.—The Stock Exchange committee has ordered 20,000 7 per cent. cumulative £10 fully-paid preference shares (Nos. 1 to 20,000) of the *British Aluminium Co. (Ltd.)* to be quoted in the official list. Application has been made to the committee to appoint a special settling day in and to grant a quotation to £200,000 5 per cent. first mortgage sterling debentures of £100 each of the *Castner Electrolytic Alkali Co. (U.S.A.)*, and the provisional certificates for £100,000 4½ per cent. debenture stock of the *County of London and Brush Provincial Electric Lighting Co. (Ltd.)* The committee has also been asked to appoint a settling day in the further issue of 10,000 £5 shares of the *Calcutta Electric Supply Corporation (Ltd.)*, and to allow the further issue of 21,902 ordinary £5 fully paid shares (Nos. 32,099 to 54,000) of *Crompton & Co. (Ltd.)* to be quoted in the official list.

WESTMINSTER ELECTRIC SUPPLY CORPORATION (LTD).—An interim dividend at the rate of 10 per cent. for the half-year ended June 30 (payable Sept. 1) has been declared.

NOTES.

THE chief electrical events probably of the past almost uneventful week have been the severe thunderstorms. With these there has been the usual crop of stories of the vagaries of globular lightning. Globe lightning is a form of atmospheric discharge which has never yet been fully explained, partly, no doubt, on account of its rarity, and also on account of the difficulty of producing it experimentally. MAX TOEPLER, who is undoubtedly the highest living authority on atmospheric discharges, deals with the matter fully in the course of a lengthy work on continuous discharges in air, briefly referred to in Mr. FOURNIER D'ALBE'S notes in another column of this issue. He points out the analogy between globular lightning and certain forms of the "brush arc discharge" discovered by him. Briefly, his view is this: An ordinary lightning flash leaves behind it a track of comparatively highly conducting air. A continuous and slow discharge passes along that track for some time after the flash. Occasionally, a place occurs in the track where there is a high resistance, and when the quantity discharged is adequate, this place glows, and continues to glow while the slow discharge proceeds.

THIS luminous place is the "globe lightning," which, as we know, is usually described as upright and elongated. Its apparently free motion along the ground is due to the facility with which the foot of the track travels along the ground with the wind or with any change in the electrostatic forces. That it should approach conductors and "strike" human beings is quite natural. That it is sometimes described as finally "exploding" is probably due to the fact that the phenomenon is destroyed by a final ordinary flash with its accompanying thunder. The current in the globe is probably not great. Prof. TOEPLER arrives at some idea of it by comparing its duration with that of an ordinary flash, which, as we know, discharges some 60 coulombs to 100 coulombs of electricity. Considering that the globe lasts from 5 seconds to 30 seconds, we should expect a current of 2 amperes to 20 amperes. Comparing its size and luminosity with the brush arc, the current would come out as about 15 amperes. But the author points out that even with only 0·01 ampere a faintly luminous mass of the size of "a child's head" can be maintained.

WE referred recently to a Paper read by Dr. M. I. PUPIN, describing experiments he had carried out on an artificial cable, in which, besides adding capacity to secure a true imitation of a submarine line, he had tried the effect of the distributed inductance prescribed by Mr. O. HEAVISIDE. Mr. HEAVISIDE has, one would think, already discussed sufficiently the mathematics of this particular subject, but Dr. PUPIN has not been satisfied to take these conclusions as he finds them, and has devoted a mathematical investigation (part of which we have been compelled to omit from the abstract of his Paper in another column of this issue) to determine what is the theoretical maximum distance apart at which inductance coils may be inserted in the cable to obtain the desired effect of distributed inductance. He obtains the result that there should be several coils in a half wave-length, a conclusion which we think must be fairly obvious to those who have followed Mr. HEAVISIDE'S writings on the subject. Moreover, as one of the factors from which this wave-length has to be calculated cannot be predetermined with extreme accuracy—we refer to the inductance of the cable—it follows that the number of coils per mile will always have to be determined more or less by experiment.

WE must of course accept Dr. PUPIN'S assurance that due precautions have been taken to ensure correct conditions in the experiment with which he tested his conclusions, although we think he would have been wiser had his apparatus not been made so compact. However, he has no doubt taken the precaution of testing that there is no transformer effect analagous to

Digitized by Google

that in the Langdon-Davies phonophore, by trying if telephonic transmission can take place by means of the coils when each half of the circuit is interrupted in the middle. If, then, Dr. PUPIN's apparatus can be considered identical in its electrical properties with a submarine cable he is to be greatly congratulated on his work, as he will then have demonstrated that better speaking can be obtained on an inductive line 250 miles long than on a non-inductive one of less than half the length, and we trust that he will find an opportunity to perform a similar experiment upon an actual long-distance telephone cable.

University of Glasgow.—The session opens on October 18th. Prospectuses, &c., can be obtained from the assistant clerk.

University College (London).—The 1900-01 session begins on October 2nd. Prospectuses may be obtained ftom the secretary (Mr. J. M. Horsburg).

Taunton Electricity Works.—The new machinery at the Taunton Corporation electricity works will be formally set in motion by the Mayoress on the 15th inst.

Glasgow and West of Scotland Technical College.—The next session opens on September 25th. Some particulars of the courses of instruction are given on another page.

University of Birmingham.—The session 1900–1901 commences on Oct. 2. Some particulars of the course of instruction in engineering are given in our advertisement columns, and a detailed syllabus will be forwarded on application to the secretary.

The Paris-Berlin Telephone.—The telephone service between Paris, Frankfort, and Berlin was opened to the public on Monday last. The charge for the use of the line for 3 minutes between Frankfort and Paris is 4fr., and between Paris and Berlin 6fr.

Parliamentary Naval Boiler Committee.—Among the members of the recently-appointed Committee to inquire into the merits of the boilers in Her Majesty's Navy we notice the name of Prof. A. B. W. Kennedy. The Committee will be empowered to report, among other matters, as to the suitability of the Babcock & Wilcox and the Niclausse types of boilers.

Cable Interruptions:—	Date of Interruption.
Latakia—Cyprus	June 21, 1899
Cayenne—Pinhieros	Oct. 11, 1899
Tangier—Tarifa	Jan. 3, 1900
Ceara—Maranham	Feb. 20, 1900
Pará—Maranham	Mar. 2, 1900
Môle-St. Nicolas—Cap Haitien	Mar. 7, 1900

Institution of Electrical Engineers—Students' Grants.—The Council has awarded the promised grant of £5 towards the expenses of a visit to the Paris Exhibition, announced in a previous issue of this journal (see *The Electrician*, July 20, p. 469), to each of the following students of the Institution:—J. F. Avila, A. Buckney, F. H. Clough, R. Fisher, A. J. L. Hurst, J. T. Urwin, T. L. James, F. K. Jewson, L. R. Lester, C. N. Nettley, R. L. Pearson, M. Solomon, C. T. Stephenson, H. J. Thomson, W. A. Toppin, A. J. Tracey, S. A. Tunbridge, G. E. Turnbull, J. H. West, and F. P. Whitaker.

Personal.—The Government of India has sent Prof. J. Chunder Bose, of Calcutta University, as delegate to the International Congress of Physicists, at the Paris Exhibition, and to the meeting of the British Association at Bradford. Prof. Bose is now in Paris.——We learn that Prof. S. H. Short has been appointed by the Commissioner-General of the Paris Exhibition an official delegate of the United States to the International Congress of Electricians at Paris on the 18th inst. It will be remembered that Prof. Short served on the International Congress of Electricians at Chicago in 1893, as a member of the Advisory Board. He was also a member of the International Congress at Philadelphia in 1884.

Proposed Duty on Raw Copper in Germany.—According to the *Elektrotechnischer Anzeiger* a number of German copper producers are agitating for a duty of 6 per cent. to be imposed on raw copper. Our contemporary does not favour this imposition, stating that not a quarter of the copper required in Germany is produced from German raw copper. It adds that German copper is used only for the older branches of the industry, such as the manufacture of brass pipes, &c., not being as suitable for electrical purposes as American copper, which, it states, is used exclusively in the German electrical industry. The following are among the figures given: In 1899 23,460 tons of copper were produced in Germany, and about 103,000 tons were used. Of this between 30,000 tons and 35,000 tons are estimated as having been required for electrotechnical purposes. German cable makers would be severely handicapped in their competition with foreign firms if the proposed duty is imposed.

Recent Thunderstorms.—Considerable damage to property has resulted from the recent thunderstorms throughout the country. On Sunday evening a severe storm swept over Derbyshire, and at Alfreton the schoolmaster's house was struck, portions of the roof being stripped off, the gas pipes being broken and the gas ignited, and three fire-places being blown out. No one was injured, however. At Boston, Lincolnshire, the same evening, St. Botolph's Church, better known as "Boston Stump," was struck by lightning, the discharge striking the high tower formerly used as a lighthouse. A heavy mass of stonework was dislodged and fell through the roof of the church, just missing the font. The Dead March in "Saul" was being played at the time in memory of the late Duke of Coburg, and had it not been for this the congregation would have been dispersing, and considerable loss of life must have ensued. Fortunately no one was injured.

The Utilisation of Blast Furnace Gases.—In a Consular report on the trade of Frankfort-on-the-Main, reference is made to the extending employment of blast furnace gases in Germany in gas engines for the generation of electrical energy. It is stated that gas engines on the Deutz system, built for this purpose, have been most successfully used in the large ironworks at Hoerde, and at the Friedenshütte, in Upper Silesia, as well as more recently in Oberhausen, Düdelingen, Völkingen, Donnersmarck, Seraing, the Rhenish steel-works at Ruhrort, and in other places. It is stated that at full load this gas engine uses only 2·6 cubic metres of the gas per B.H.P., and at one-third load 3·5 cubic metres, and that there is no unusual wear and tear in the working parts. Some of the works already mentioned are putting in additional gas engines on the same system, and the Kombach works in Loraine, in which are seven large blast furnaces, is about to erect two 600 H.P. four-cylinder gas engines for blast furnace gases.

Summer Meeting of the Institution of Junior Engineers.—The following programme has been arranged for the summer meeting of this Institution at Newcastle-on-Tyne. The meeting commences on Monday, the 13th inst., with a reception at the Town Hall by the mayor, followed by a visit to Messrs. Swan and Hunter's works, and the works of the Newcastle-on-Tyne Electric Supply Co. On Tuesday the Institution will visit Messrs. Sir W. G. Armstrong, Whitworth & Co's. works at Elswick, also the engineering department of the Durham College of Science and the works of the Newcastle and District Electric Lighting Co. On Wednesday there will be a river trip to view the Tyne Improvement Commissioners works, and on Thursday an excursion to Sunderland to see the works of the River Wear Commission. The meeting concludes on Friday, the 17th inst., with visits to the works of the United Alkali Co., and the preliminary works of the Corporation electric tramways, while in the evening a dinner will be given at the County Hotel, the president, the Hon. C. A. Parsons, F.R.S., in the chair.

Visit of the American Institute of Electrical Engineers.—On page 469 of our issue for July 20 we gave some particulars of the visit of the American Institute of Electrical Engineers. The following further particulars of the programme have been supplied us by the Secretary of the Institution of Electrical Engineers, who are entertaining these American visitors: The river party next Sunday will be given at Henley, electric launches taking a short run (probably to Shiplake and back)

Digitized by Google

before the lunch, which will be at the "Red Lion"; after lunch the party will proceed to Boulter's Lock by launch, and will return to town by train from Maidenhead. The dinner on the 13th inst. will be at 7 for 7:30 p.m. at the Princes' Restaurant, Piccadilly. During the morning of the same day visits will be made to the laboratories of the Board of Trade, or (alternatively) to the telegraph department of the General Post Office, and in the afternoon to the Central London Railway, and to the Davies-street station of the Westminster Electric Supply Corporation. On August 14 the party will visit the School of Military Engineering and the Royal Dockyard at Chatham, and will partake of the hospitality of the Royal Engineers' mess at lunch. The members of the party have been most kindly invited to a reception by Lady Fraser in the afternoon.

Connecting up Accumulator Plates.—Dr. O. Schmidt, in a long article on this subject in No. 12 of the *Centralblatt für Accumulatoren und Elementenkunde*, states that the only rational method of effecting this at the present time is by autogenous soldering, and that in accumulator works the oxygen and hydrogen gas required for the process are best produced electrolytically. Small gasometers should be employed to equalise the pressure and for storing the gases when they are produced more rapidly than they are required for soldering purposes. In the Tudor works such a system is employed, and by the arrangement of the apparatus it is quite impossible for the gases to mix until they meet in the blow-pipe flame, and the blow-pipe is so constructed that the proportion of each of the gases passing into the flame can be regulated. The advantage of this is that an economy in the consumption of oxygen, which is the more expensive gas, can be effected, for, as Dr. Schmidt points out, one-fifth part by volume of atmospheric air *is* oxygen, and therefore it is not necessary to supply the theoretical proportion of this gas to the flame. The quantity of gas consumed per hour by the blow-pipe in the works amounts on an average to 100 litres of hydrogen and 88 litres of oxygen. Where soldering has to be effected outside the works portable steel bottles are used for the conveyance of the gases, which are compressed into them under a pressure of from 120 atmospheres to 150 atmospheres. A description is given of taps for regulating the pressure of the gas on its release from the bottles, and also for the management of the blow-pipe flame.

Earthing Distribution Networks.—At the recent meeting of the National Electric Light Association, a report by a committee appointed to consider the question of "grounded circuits" was read. The report was signed by Messrs. W. Brophy and J. I. Ayer, the late Lieut. S. Dana Greene having been the third member. "Some very eminent professors, nearly all fire insurance offices and inspectors, and some prominent workers in the electrical field" in America, argued against the practice of earthing the middle wire, characterising it as extremely dangerous. Others, less prominent perhaps, says the report, but having more practical experience with the actual operation of three-wire systems, took the opposite view. Although nearly all fire insurance boards issued their edict against earthing the middle wire, this custom has become almost universal in America, experience having shown that it has not increased the fire hazard or losses by fire, but perhaps decreased them. The committee, therefore, recommends earthing the middle wire, being of the opinion that as long as high-grade insulation is maintained in house wiring, little danger need be apprehended. The committee also reports on the question of earthing one side of secondary circuits in transformer systems. Some deaths and fires have occurred from the passage of the primary current into the secondary circuits, and in each case which the committee have investigated no evidence of the leakage had been previously given by an increase of the candle-power of the lamps or otherwise. The report continues:—

> Various plans have been proposed and devices tried to prevent accidents from this cause, the most effective step being the improvement of the insulation of the transformer. The "grounding of the outer case," connecting the middle of the secondary coil to "ground," and a "grounded" magnetic shield have all been tried to some extent and with varying degrees of success. Where transformers are placed in manholes and connected to underground lead-covered cables the case can be securely grounded to the lead covering of such conductors; but when they are placed on poles, structures, roofs, and walls of houses, it is very difficult, if not impossible, to connect either coils or case to a good and secure "ground." Could this end be gained the liability of breaking the ground wire would be very great, and when broken such wires would be a source of danger. No magnetic electric device for automatically grounding the secondary in case the high-potential current passes over the same known to your committee has thus far proved reliable. That type that is constantly in circuit, owing to its almost constant consumption of energy, is objectionable, while those that depend on a sudden increase of voltage are unreliable.

It concludes with the expression of opinion that, although permanent "grounding" of one side of secondary circuits is not an absolute preventative of accidents to person and property, yet the committee firmly believes it to be a step in the right direction.

Electrical Power Transmission in Workshops.—An interesting report on the relative advantages of electric and shafting driving in workshops was presented by a committee of the Master Mechanics' Association at a recent convention at Saratoga. The report enters into details of the various advantages and disadvantages of methods of driving, and finishes up with the following "Conclusions":—

> 1. In a small shop, consisting of practically one building, having an equipment of small tools for light work only, electric transmission will not be found a paying investment. In such a shop, however, an electric lighting dynamo will be a convenience, and may be utilised to run a few labour-saving electric tools, such as a cylinder-boring outfit, a turn-table motor, &c.
>
> 2. In an extensive railway shop plant the installation of a central power station and electric transmission will always be found advisable, as it will not only result in the most economical system in respect to operation, but will make possible far more important shop economies, namely, an increase in quantity and quality of output and a reduction in cost of handling the same.

In the course of the report an interesting table is given, prepared from tests made of the power required to drive typical railway shop tools both for iron and wood working. The greater number of these figures are taken from tests at the Baldwin locomotive works and the Pennsylvania Railroad Co.'s works. It is also stated that, as a rough guide in laying down power plants in workshops, the horse-power of the generating station per man for railway shops averages about 0·4. The following is the table referred to:—

Tool.	Nature of work.	Horse-power required. Empty	Lght load.	Full load.	No. of cutters
70in. wheel lathe	Wheel centre[1]	...	4·4	7·9	2

CONTEMPORARY ELECTRICAL SCIENCE.

[Compiled by E. E. Fournier d'Albe.]

Continuous Discharges in Air.—When a battery of cells is used as a source of electric energy, the constant element in the circuit is the E.M.F., while the current depends upon a variety of external conditions. The case is reversed on using an influence machine driven at a constant speed, for then the mean current is the constant element, while the E.M.F. is a dependent variable. This fact has been utilised by M. Toepler for investigating the continuous discharge in air at atmospheric pressure as dependent upon the current. This continuous discharge may appear in four different forms—viz., glow, brush, brush arc, and flame arc. All of these may appear both at the positive and negative electrodes, but to simplify matters the author takes care nearly to suppress the effects at one electrode by covering it with a flat bad conductor such as a slate. He is thus enabled to study the effects at the two electrodes independently. As a general rule an increase in the current strength brings about a transition from the glow to the brush, and finally to the brush arc. But this transition is not continuous unless the capacity in the circuit is negligible. Otherwise the three continuous stages are separated by stages of discontinuous spark discharge, and as the capacity increases the discontinuous stages encroach until the brush arc is almost entirely eliminated. Finally, the author deals at length with two forms of natural continuous discharge—viz., St. Elmo's fire and globular lightning.

[M. Toepler, *Ann. der Physik*, No. 7, 1900.]

Electrostatic Lines of Force.—In designing an instrument for plotting electric lines of force, analogous to the magnetic needle, the difficulties are encountered that the forces are small and the charge is not permanent. F. J. Rogers has, however, designed two kinds of "electrostatic needles" which answer very well. The first consists of an aluminium needle bearing at its ends two gilt pithballs. The needle is perforated in the centre and mounted on a horizontal pin stuck into an ebonite rod. With this simple contrivance it can be shown to the student that the lines of force are normal to the surface of a charged conductor, and not normal to the surface of an ebonite rod, and that in the case of two oppositely charged conductors placed near each other the lines of force issue from one conductor, curve over, and end on the other. The second form of needle is even more useful. It consists of a little ebonite rod in place of an aluminium needle, and the pithballs are charged positively and negatively respectively. Thus we have a complete analogue of the magnetic needle. If the neutralising rod of a Voss machine is removed while the machine is running, the inductors change the sign of their charge every few seconds. This change of sign is promptly indicated by the electrostatic needle described.

[F. J. Rogers, *Phys. Review*, July, 1900.]

Continuously-Adjustable Condenser.—L. J. Briggs has designed an adjustable condenser on a modern plan. It is of the mica type, but the usual tinfoil is replaced by slightly curved elastic brass sheets. The effect of this is that the condenser tends to expand, and has to be kept pressed down by a screw press. The process of screwing down and thus flattening the sheets is to increase the capacity of the condenser, and when they are quite flat the capacity in one such instrument is four times the original capacity. The curvature given to the sheet brass by the manufacturer in rolling it for shipment is found to answer very well. The range of capacity may be greatly increased by dividing the condenser into three or four sections, so arranged as to permit their being thrown in multiple by a suitable switch. By dividing the condenser into three sections, the first of which contains three-fourths of the condenser sheets, the second three-fourths of the remainder, and the third section the remainder of the sheets, the range of capacity can be increased 16 times, or the minimum capacity obtainable will be one-sixty-fourth of the maximum. The adjustment will, moreover, be perfectly continuous throughout this range. On account of the double dielectric used (mica and air or oil) the change of capacity is most rapid when the plates are nearly flat.

[L. J. Briggs, *Phys. Review*, July, 1900.]

Uranium Rays.—H. Becquerel has not yet succeeded in obtaining "inactive" uranium. When uranium chloride is mixed with barium chloride, and the barium is precipitated as sulphate, the latter takes down with it the greater part of the radio-activity of the uranium. The question remains as to whether a further application of the same process would eventually result in the uranium being made entirely inactive. Becquerel has therefore applied the same process 18 times over to the same specimen. He found that the barium sulphate precipitated was less and less active, and that correspondingly the loss of activity of the uranium became less and less in proportion to its initial activity. Between the eighth and twelfth operation the variations in activity were sometimes positive and sometimes negative, and could possibly be due to the presence of more or less water, as the salt is hygroscopic. In the case of the unpurified product, aluminium is more transparent for the rays than glass, but the case is reversed in the purified uranium, whose rays obey rather the rules of light than those of Röntgen rays in the matter of absorption. After the fifteenth operation, another decided diminution of activity sets in, bringing it down to one-sixth of the original activity. What happens after the eighteenth operation is not yet known.

[H. Becquerel, *Comptes Rendus*, July 16, 1900.]

Effect of Temperature upon Magnetism.—According to Ewing, the magnetising process of magnetic metals may be divided into three stages. During the first stage the permeability is small, and there is practically no retentiveness. In the second stage the curve of magnetisation rises rapidly, and the permeability is high. In the third stage the permeability decreases and the specimen approaches saturation. The effect of heat is regarded as making the transition from one stage to another occur at lower values of the magnetising force, owing to the vibrations set up and the weakening of the inter-molecular forces. R. L. Wills has investigated the effect of heat on the magnetic properties of certain alloys of iron which at the ordinary temperature had been previously found to give very different magnetic results when in different physical conditions. In wrought iron the permeability increases slightly as the temperature is raised to about 500deg. With fairly strong fields, such that the third stage of the magnetising process is brought on before any heat is applied, there is no appreciable increase in permeability as the temperature rises. But in an alloy containing 2·6 per cent. of aluminium there is not only no increase, but a decrease as the temperature is raised from 360deg. to 489deg. This confirms the impression as to the exceptional character of the influence of aluminium upon iron.

[R. L. Wills, *Phil. Mag.*, July, 1900.

THE SYDENHAM BOILER EXPLOSION.

The four photographs on the opposite page give the history of the disastrous boiler explosion which wrecked the works of the Crystal Palace District Electric Supply Co. on July 25, and was briefly referred to in our issue of July 27. In the boiler-house were five boilers of the locomotive type and one new Hornsby boiler, the locomotive boilers having been put in at the time the station was built in 1893. It is one of these locomotive boilers that exploded, the crown remaining in the boiler-house, and the boiler itself breaking through the wall of the engine-room at the roof level, passing through the opposite wall of the engine-room and settling down in a private garden on the other side. It is premature at present to suggest the cause of the disaster, as the Board of Trade inquiry is still to be held. Fig. 1 is from a photograph of the boiler taken after the explosion; it is seen that the roof was blown away and that the force of the explosion pushed back the adjacent locomotive boiler. Fig. 2 shows the two gaps made in the walls of the engine room, Fig. 3 is from a photograph of the boiler in its present position, and the crown of the boiler that remained in the boiler house is illustrated in Fig. 4. The photographs were taken by Mr. H. Hallier, of High-street, Upper Sydenham. As can be gathered by a study of these, the works will not be in a condition to supply current for some time to come.

THE RENO INCLINED ELEVATOR.

A new attraction has been added at the Crystal Palace (Sydenham) in the form of an "inclined elevator." This, the directors of the Crystal Palace hope, will entice a greater number of people to the gallery of their large building, for it appears that the exhibition of pictures there is much neglected by the public. Elevators of this type have been in operation some years in the United States, and in Harrod's stores in London a somewhat similar one has long been in use, but the "Reno" elevator exhibited at the Crystal Palace is different in some respects from the latter.

FIG. 1.—RENO INCLINED ELEVATOR AT THE PARIS EXHIBITION.

These slats are 3ft. 6in. in length (*i.e.*, in the direction perpendicular to the chain), and are only a few inches in width, corresponding of course to the length of a link of the chain. They have fastened to them a series of rubber-covered longitudinal ridges, each being ¾in. wide and 1in. high, to serve as a comfortable footing for the passengers. Beneath each wooden slat are attached, one at each end, small wheels made of a material termed "Hemacite" which appears to be a compound having rubber and several other substances in its composition. These rollers travel upon angle-iron tracks both on their upward and downward paths, and ensure easy and noiseless running.

The upper sprocket wheel is driven through a belt and spur gearing by a 9 H.P. electric motor of American manufacture, supported on the same framework as the elevator. The speed of the motor is 650 revs. per min., which is reduced to 14 revs. per min. for the sprocket wheel, and the inclined floor moves at about 90ft. per min.

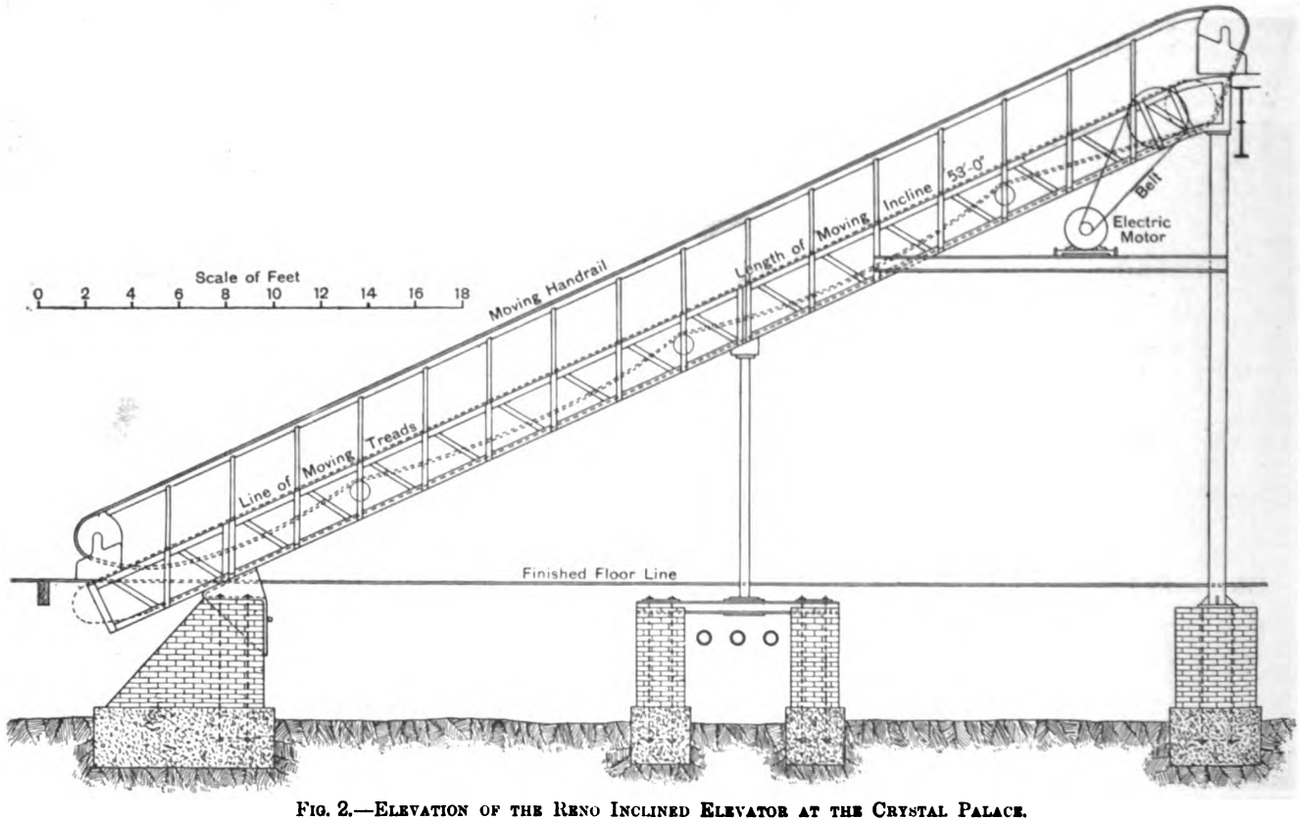

FIG. 2.—ELEVATION OF THE RENO INCLINED ELEVATOR AT THE CRYSTAL PALACE.

The elevator consists of a moving floor and a hand-rail moving at the same speed, inclined at an angle of 25deg. with the horizontal. It is carried on a steel framework bolted at the top to the girders supporting the gallery, and secured in a similar manner below. The moving floor is formed of a series of transverse slats or treads attached to an endless chain which passes over a sprocket wheel at each end.

At the top end of the incline is a cast-iron plate which serves as a landing stage, and forming part of this is a sort of comb

Digitized by Google

the prongs of which are curved to follow closely the contour of the chain of slats as it arrives on the sprocket wheel. These prongs are so proportioned that they fit in exactly between the longitudinal ridges on the slats already mentioned, and in this way the feet of the passengers are moved off smoothly on to the landing stage. So perfect is this action that a handkerchief or paper dropped on the incline is not carried round beyond the top but remains on this comb until it is picked up.

In order to prevent the machine from running back if it stops while passengers are on it—for instance, by the motor fuse blowing—a ratchet wheel and pawl are fitted to the lower sprocket wheel, and another simple pawl rests on the under part of the chain at its centre.

The moving handrail is formed of an endless steel chain, covered with a flexible rubber covering, passing over sprocket wheels much in the same way as the inclined track itself, and moving with the same peripheral velocity. In this case, however, it is necessary to provide against the chain being pulled out of its course too much by the passengers, and this is done by the use of links, the under side of which have little cross pieces which slide in groves cut in the fixed bannister which this moving hand-rail covers. At the upper end the moving rail passes down over its sprocket wheel and thus the passenger is obliged to release it.

We are informed that no less than 10,000 people paid a penny to make use of the elevator on Whit Monday, when it was opened to the public.

Although constructed exactly in accordance with the American design, the elevator has been made in this country by Messrs. G. Aston & Son for the Reno Inclined Elevator Syndicate, who are the owners of the British patents. Five of the inclined elevators at the Paris Exhibition are also of the "Reno" construction, and one of these is illustrated in Fig. 1. Fig. 2 shows the general arrangement of the elevator at the Crystal Palace.

The following are the makers' estimates of the horse-power required for working an inclined elevator 19ft. high:—

1·2	H.P.	Elevator free.			
2·36	do.	do.	carrying up	600	passengers per hour.
2·8	do.	do.	do.	1,200	do.
2·95	do.	do.	do.	1,500	do.
5·15	do.	do.	do.	2,250	do.

An interesting modification of this elevator is one specially suitable for docks, &c., in which goods have to be transported from one level to another, the difference in level being not, however, a fixed quantity. One end only can therefore be fixed, and the apparatus consists of a trussed steel framework which carries an endless travelling platform. This passes around suitable wheels at each end, those at the upper end being driven by an electric motor. The machine is mounted on swivelled wheels, and can be moved easily to any position on the dock or in the warehouse; being on a self-adjusting base, it can then be raised to the required position by pulley and tackle. Such an elevator, 38ft. in length, weighs about 45 cwt. This appliance should prove even more useful than the fixed pattern.

FRENCH CABLE PROJECTS.

The report of the Commission appointed to examine the question of the establishment of a system of submarine telegraph lines to connect certain French colonies with the mother country has been recently published. The document is accompanied by a map, a reproduction of which, with translation where necessary, is given in the present issue, showing the cables which it is proposed to lay. After setting out the desirability of the projected connections from a French political point of view, and the position of other Governments in regard to the subject of submarine cables, the following principles are laid down as necessary in dealing with the matter: (1) Submarine telegraph lines between France and her colonies should, where no absolute material impossibility exists, be direct and without landing on foreign soil. Such landings, where indispensable, should be as few as possible, and should be by preference upon the territory of friendly nations deemed the most capable of making their neutrality respected. The lines should be as numerous as possible, so that dependence need not be placed upon the goodwill of a single foreign power. Lines in deep water should be preferred on account of their relative security. Landing places, which are the most vulnerable points of a line, should be as far as possible at fortified ports, and preferentially naval bases. (2) Isolated cables connecting with a foreign system, which benefits by the transit, have little commercial value or political importance, their working being expensive and the service indifferent. Complete and logical systems should be established able to tap commerce and meet the competition of rival lines. The landing places should be concentrated at as few points as possible, so as to form "telegraphic knots" favourable to good working.

A summary of the existing communications available is then given, with the following *résumé* as to the submarine telegraph system "indispensable to the security of our Colonial Empire," that part considered capable of immediate realisation being shown in italic.

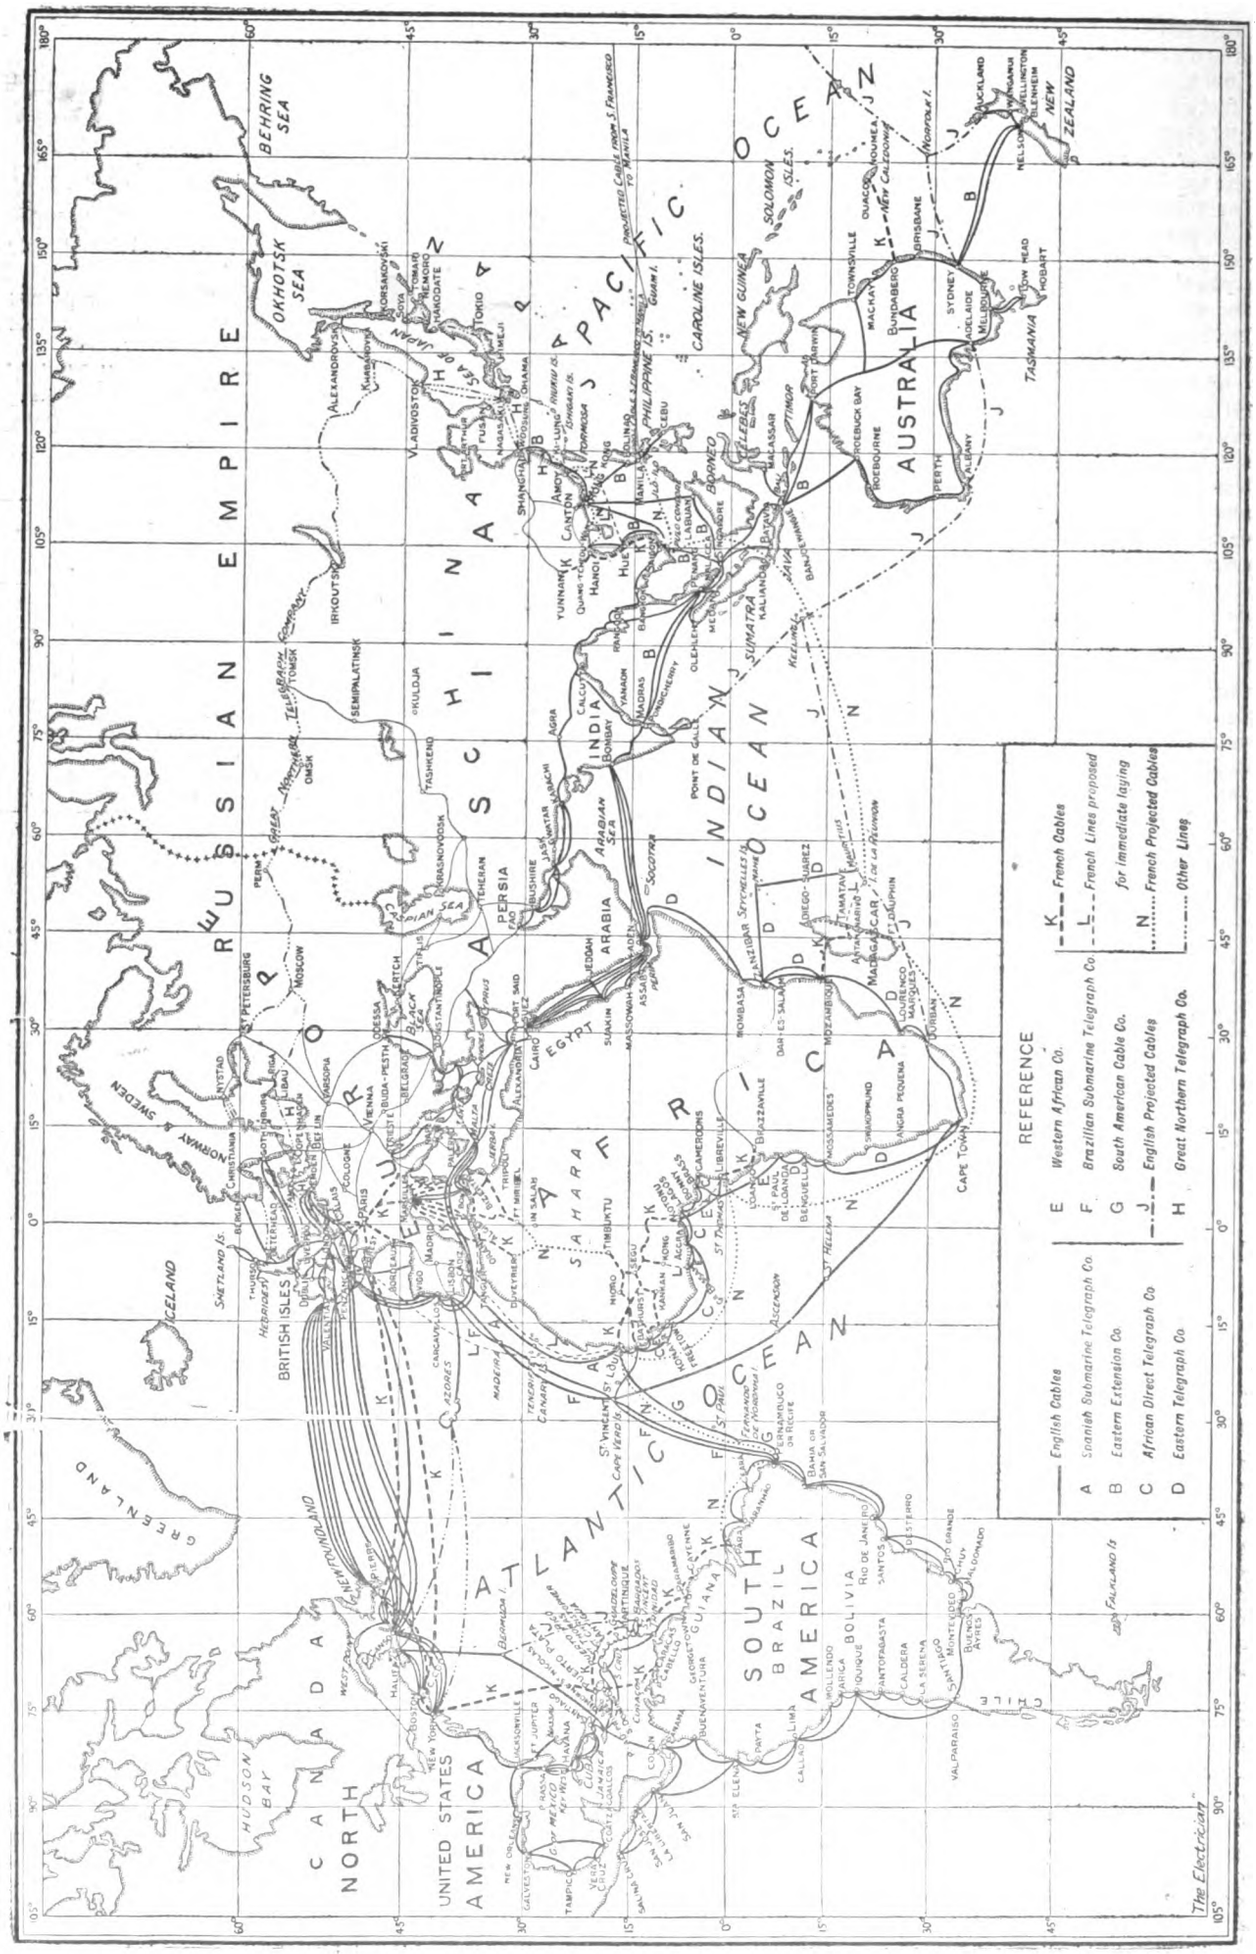
Description of lines.		Length in marine miles.	Approximate cost.
Mediterranean System—*Oran-Tanjier*		290	£32,000
Atlantic System.	*Brest-St. Louis* (or *Dakar*)	2,500	680,000
	St. Louis-Pernambuco (or *Cayenne*)	2,500	400,000
	Aerial line—*St. Louis to Kotonou*	2,500	40,000
	Kotonou-Libreville	660	96,000
	St. Louis-Libreville (direct)	660	720,000
Indian Ocean System.	Libreville-Madagascar	4,730	1,480,000
	Madagascar-Reunion	455	72,000
	Reunion-Indo-China	455	1,520,000
Indo-Chinese System—*Hue-Amoy*		1,000	220,000
		15,760	£5,260,000

From the point of view of length of cable, it may be pointed out that cables of 2,500 miles will be slow, even with a heavy core, as well as costly; while the section from Libreville to Madagascar would form the altogether unparalleled span of 4,730 nautical miles. With the largest core which could be safely handled, say 650/400, the speed on such a section would not be more than about two words a minute, and only patriotism run mad could recommend the laying of a line one-third of the way down the west side of Africa, round the Cape of Good Hope, and up past Natal to the southern end of Madagascar. To call such a line strategic is an abuse of language, seeing that it would pass within, perhaps, 100 miles of Cape Town, and would be vulnerable throughout its enormous length.

Then the maintenance of such a cable would certainly be excessively costly. A glance at any telegraph map will show that the English companies have no lines between Cape Town and Durban, round the South of Africa; the fact of the matter being that they have always recognised the unsuitability from a submarine cable point of view of that stretch of coast, on account of the dreaded Agulhas current, which frequently raises dangerous seas and causes heavy rollers to break upon the shore. This current is known to exist at least 120 miles from land, and to lay a submarine line such as the French have projected, beyond its influence would considerably lengthen an already impracticable cable.

From a commercial point of view, there would be no traffic worth speaking of between the French possessions on the West Coast of Africa and Madagascar, while business between France and her colonies could not possibly be sufficient to support such great lengths of cable as are projected. Indeed, if a paying traffic existed, it could not be got through the system proposed. It is significant, however, that no attempt is made in the report to estimate the traffic which would pass over the lines when laid, and with hardly an exception the cables would not touch at points where any business of importance could be expected. Single lines of cable of great length are notoriously unreliable, and in competition with triplicated and duplicated routes, with sections of reasonable lengths, would have no chance at all of building up a traffic which would justify duplication. The fact of the matter is, of course, that there are not a sufficient number of inter-

Digitized by Google



MAP SHOWING EXISTING AND PROJECTED CABLE ROUTES.

Digitized by Google

mediate points belonging to our neighbours to permit of a practicable all-French system of cables being established, and that Government pecuniary support of such lines would only be a stupid waste of the money of the taxpayers. Nevertheless, as the word "patriotism" has been invoked, it is by no means certain that an attempt will not be made to carry out the programme indicated.

In considering the capacity for manufacturing telegraph cables in France the report points out that the State has no facilities for work of this kind on a large scale, and recalls that there are two French undertakings for the construction of submarine lines: The Société Industrielle des Telephones has factories at Bezons and Calais, owns the cable ship "Arago," of 3,406 tons (able to carry 1,315 miles of deep sea cable), and can manufacture on the average 80 knots *per diem* of heavy cable and 50 knots of deep sea. In six months time it could increase its production to 45 miles of heavy cable daily, and would then provide a second ship of 5,000 to 6,000 tons. The Grammont establishment at Pont-de-Cherui and St. Tropez could turn out 15 marine miles of cable per day and double its production in three months.

After considering the question of construction and working by the State it is pointed out that the Government project recommends that the work be carried out by private French industry under the direction of the State, and that the working of the lines be entrusted to companies to be formed for the purpose. This is regarded as only a provisional measure to be followed by direct concessions, under State guarantee or annual subsidy, so that the Treasury would only have to bear a diminishing annual charge which might eventually be extinguished by the development of the traffic.

As to the provision of the amount shown above as the estimate for carrying out the programme in question it will be well to quote the report:—

"Of this total of 130 million francs (say £5,200,000) the Government proposes to expend in 1900-1901 a sum of 17 millions (£680,000), which does not include the annual budget credits to cover the deficit on working and maintaining the system.

"If the sum of about 25 millions (£1,000,000) proposed by your Commission be adopted it will require from five to six years at least before the Colonies possess the means of communication at present lacking. This delay would not be unreasonable, and would probably even be imposed by the technical necessities of construction. But modest as is the sum, relative at least to the enormous outlay of England upon its cables, would it not throw too great a burden upon our budgets, weighted already by the new programme of Colonial military defence, with which the cable system has such close relations? The credit of 17 millions (£680,000) proposed by the Government does not appear, one observes with surprise, in the Budget project for 1901. This is certainly an omission which is not of happy augury for the prompt completion of the cables, if the State Budget alone is to bear the charge."

After pointing out that the management of the French cable companies has not inspired public confidence, the Commission remarks that whether it is possible to institute a better state of things either in regard to existing companies, under fresh guarantees, or by forming new companies, the Government alone can say, and concludes by recommending that the project of law submitted to it be approved, with the modifications indicated in its report.

It will be seen that the projected extension of French cable enterprise is of an ambitious and far-reaching character, but that there is altogether lacking in the scheme any real element of soundness, financial or otherwise; and that it is not, even in conformity with the above-quoted principles laid down by the Commission as necessary in dealing with the matter. From the political point of view, the French people may be gratified by the consideration of proposals on so great a scale, but the outlay involved would be out of all proportion to the advantages immediate and prospective, commercial and strategic. One is inclined to adapt the words of one of their own generals: "C'est magnifique mais ce n'est pas la télégraphie."

FALL OF POTENTIAL ALONG TRAMWAY RAILS.

BY E. PARRY.

Assuming an ordinary tramway line construction, consisting of rails laid on a bed of concrete, grouted, and filled in with sets, it is reasonable to conclude that given the conductivity of the rail and the surface conductivity between the rail and the earth, the fall of potential along a line, given the potential difference between the far and near end, may be predicted, and consequently the current in the rail at any point can be ascertained from the potential gradient. The problem is similar to that of a heat conductor exposed to the air, heated at one end and cooled at the other, and other kindred phenomena. The equation which expresses the temperature at any point in a bar subject to the conditions mentioned, and assuming that the temperature is constant throughout a section, is given by Fourier in his "Theory of Heat," chapter I., page 60.

$$v = Ae^{-x\sqrt{\frac{2h}{kl}}} + Be^{+x\sqrt{\frac{2h}{kl}}};$$

where v is the temperature at distance x from the end of the bar,
h is the external conductivity,
k is the conductivity of the material of the bar for heat,
$2l$ is the side of a square bar, and
A and B are arbitrary constants.

By substituting for the above constants the corresponding electrical constants, the same equation expresses fall of potential along an ordinary tramway track, and is the main fact or basis of any phenomena connected with current distribution in the earthed sections of an electrical circuit, subject to disturbing influences due to want of continuity at rail joints, the variation in current density throughout the cross-section of the rail, variation of surface conduction along the rails, and perhaps to a slight extent to electrolytic action; the main disturbing factor, however, as regards a particular line worked electrically is the action of the contact surface of the rest of the track system to which it is metallically connected.

In order to establish a basis for actual cases let us assume in the first place a single rail, laid in earth, which is continuous and isolated from any other rail or system of rails. If an electric current is passed in at one end and taken out at the other end by insulated conductors, a proportion of the current will flow out of the rail between one end and the middle of the rail, and will flow in again along the section between the middle of the rail and the other end. The distribution being symmetrical, the current-density in the rail, under the conditions assumed, will diminish from a maximum at the distant end to a minimum at the middle, and will increase again and attain a maximum at the home end; the point of minimum density in the rail is therefore the point which is at the same potential as the earth, assumed for convenience to be zero in the following investigation:—

Let X = The total length of the rail from end to end.
A = The cross-sectional area of the rail.
L = The surface area of the rail per unit length in contact with the ground.
k = Conductivity of material of rail.
h = External conductivity between rail and earth, *i.e.*, the reciprocal of the specific contact resistance.

Let v be the difference of potential between rail and earth at distance x from one end of the rail.

Consider a lamina whose thickness is dx.

The contact surface is Ldx.

Conductance is $Lhdx$.

Quantity of electricity passing across the contact surface in unit time is $vLhdx$.

This loss must equal the difference between the quantity which during unit time enters the lamina at one face and leaves it at the other face.

The area of the lamina is A.

Conductance is kA.

Quantity of electricity entering the surface at x per unit time is $-k\mathrm{A}\frac{dv}{dx}$.

Digitized by Google

The quantity of electricity passing through the surface at $x+dx$ is

$$-kA\frac{dv}{dx}-kAd\left(\frac{dv}{dx}\right)dx,$$

using two terms of the series.

The difference between the quantities entering and leaving the lamina is

$$kA\frac{d^2v}{dx}dx,$$

which is numerically equal to $vLhdx$; therefore

$$\frac{d^2v}{dx}=\frac{Lh}{Ak}v,$$

the solution of which is

$$v=Ae^{-x\sqrt{\frac{Lh}{Ak}}}+Be^{+x\sqrt{\frac{Lh}{Ak}}}.$$

The distribution being symmetrical the point of zero difference of potential as regards the earth is at a distance X/2 from one end. We have therefore the relation

$$0=Ae^{-\frac{X}{2}\sqrt{\frac{Lh}{Ak}}}+Be^{+\frac{X}{2}\sqrt{\frac{Lh}{Ak}}}$$

whence $$B=-Ae^{-X\sqrt{\frac{Lh}{Ak}}}$$

If $$A+B=V$$

$$V=A\left(1-e^{-X\sqrt{\frac{Lh}{Ak}}}\right)$$

and $$v=\frac{V}{\left(1-e^{-X\sqrt{\frac{Lh}{Ak}}}\right)}\left[e^{-x\sqrt{\frac{Lh}{Ak}}}-e^{-(X-x)\sqrt{\frac{Lh}{Ak}}}\right]. \quad . \quad (1)$$

Referring to equation (1)

$v=V$ for $x=0$,
$v=-V$ for $x=X$,
$v=0$ for $x=X/2$.

V is therefore the maximum difference of potential between rail and earth.

Equation (1) is the law of potential differences along a rail under the conditions specified. From this it follows that the current density γ at any point x is $-k\frac{dv}{dx}$ and the current is $kA\frac{dv}{dx}$, the law of current density along the rail is therefore

$$\gamma=-k\frac{dv}{dx}=\frac{kV\sqrt{\frac{Lh}{Ak}}}{1-e^{-X\sqrt{\frac{Lh}{Ak}}}}\left[e^{-x\sqrt{\frac{Lh}{Ak}}}+e^{-(X-x)\sqrt{\frac{Lh}{Ak}}}\right]$$

by placing $x=0$ or $x=X$, we have

$$\gamma=\frac{kV\sqrt{\frac{Lh}{Ak}}}{1-e^{-X\sqrt{\frac{Lh}{Ak}}}}\left(1+e^{-X\sqrt{\frac{Lh}{Ak}}}\right),$$

which gives the maximum current density for any value of V which may be assumed. The minimum current density by our hypothesis is obtained by placing $x=X/2$ and its value is therefore

$$\gamma_{x=\frac{X}{2}}=2\frac{kV\sqrt{\frac{Lh}{Ak}}}{1-e^{-X\sqrt{\frac{Lh}{Ak}}}}Xe^{-\frac{X}{2}\sqrt{\frac{Lh}{Ak}}}$$

Dealing with the practical constants h and k, it will be seen by reference to a Paper on "Earth Returns for Electric Tramways," by Mr. H. F. Parshall,* that the specific resistance of the material of modern steel rails may be taken as 11 times that of copper at 60°F. The specific resistance of high conductivity copper is defined by the recent report of the "Committee on Copper Conductors" to be 6·6788 by 10^{-7} ohms per cubic inch at 60°F., and accordingly the specific resistance of the material of steel rails averages about $7{\cdot}35\times10^{-6}$ ohms per cubic inch. The value of k is therefore taken as $10^6/7{\cdot}35$.

* *The Electrician*, 1898, Vol. XLI., p. 54.

The value of h is not so determinate. Tests carried out between iron plates buried in the earth show considerable variation in resistance. We have, however, to deal in practice with rails laid under particular conditions; the important point is to get an average value measured over long lengths of track, so as to eliminate any resistance due to the earth. As a result of experiments measured over a length of 4 miles and 7 miles of double track, the contact resistance per square inch appears to be about 737,000 ohms per square inch.

The value of h is therefore 1/737,000.

As the construction of tramway lines in Great Britain is practically identical, it is not anticipated that results will vary much from the above, and the method of construction minimises to a large extent any variation which would result from differences in the nature of the soil.

Assuming any particular type of girder rail the value of L/A is approximately constant, and in the following curves it is taken as 3·15 as a result of measurements upon a modern type of girder rail. The value of $\sqrt{\frac{Lh}{Ak}}$ is therefore 1/180,000. In order to construct the voltage and current curves, it is necessary to assume either a maximum value of potential difference between the two ends or the current density at either end; for instance, the Board of Trade limit may be assumed for the maximum potential difference. However, it is found more convenient for the purpose of this Paper to assume a value for the maximum current density, and in the following curves the value of the current density is assumed to be 2·5. Referring to the curves in Figs. 1, 2, 3, and 4, the curve marked γ is the current density curve, and the curve marked v is the potential curve.

With reference to Fig. 1: The total distance is 2 miles, and the ratio of the current midway between the two ends to the current entering is $2{\cdot}36/2{\cdot}5=0{\cdot}945$, and the stray current is, therefore, about 5·6 per cent. of the current entering the rail. The potential difference required on the basis assumed for these curves is 2·24 volts.

With reference to Fig. 2: The distance is 4 miles, the ratio of the two current densities is $1{\cdot}96/2{\cdot}5=0{\cdot}784$, the percentage of stray current is 22 per cent., and total potential difference corresponding to the current density assumed is 4 volts.

Fig. 3 is plotted for a total distance of 6 miles, the ratio of current densities is $1{\cdot}54/2{\cdot}5=0{\cdot}616$, the stray current is 38 per cent., and the total potential difference is 5·2 volts.

Fig. 4 is plotted for a distance of 8 miles. Here the ratio of the current densities is $1{\cdot}145/2{\cdot}5=45{\cdot}8$, the stray current is 54 per cent., and the total potential difference is 7·8 volts.

Fig. 5 shows a curve plotted with the abscissa representing the total distance in miles, and ordinates representing the ratio of the current midway between the two ends and the current entering or leaving the ends. It will be seen that whilst this value is never zero it is less than 1 per cent. for distances greater than 18 miles.

Fig. 6 is a comparison between the voltage required for the same current in the case of a continuous length of rail with no leakage (curve v^1) and the voltage required for the same length of rail under the conditions assumed (curve v), the curve v^1 being of course a straight line. The peculiarity of the curve v is that for distances exceeding 10 miles the value of v increases very slowly.

With regard to the curves generally, it should be noted that they hold good for a particular type of rail, irrespective of the weight of the rail, the curve γ being a curve of current density. The total current is proportional to the weight of the rail used, and the curve of potential holds good for any number of rails in parallel, provided that the current is increased in the same proportion.

The curves form the basis of actual conditions, and, as a first approximation, if a correction is made for the resistance of the joints, the total potential difference for any given current will be found to agree closely with actual conditions. Take the case of 6 miles of rail of 76lb. weight per yard laid in 30ft. lengths:—

The number of joints per mile is 176.
Total number of joints = 1,056.

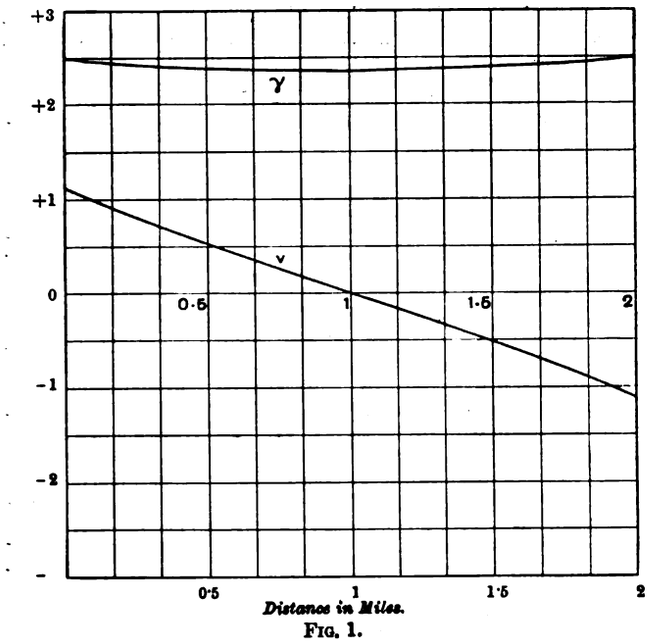

FIG. 1.

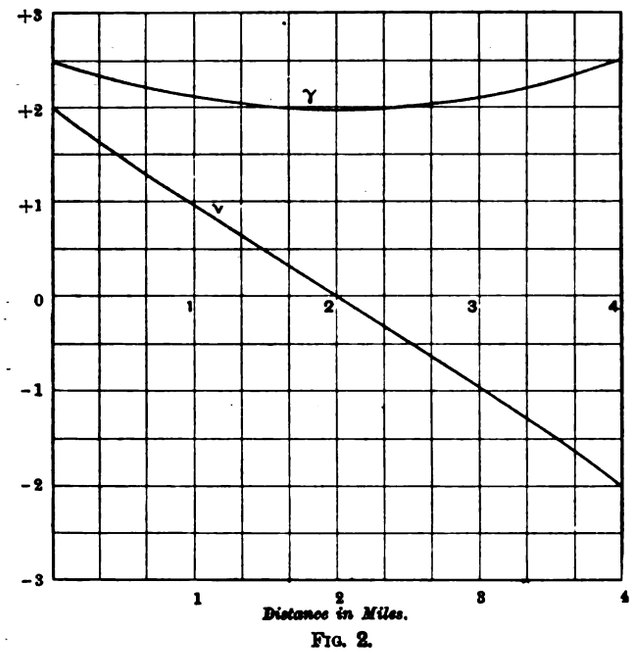

FIG. 2.

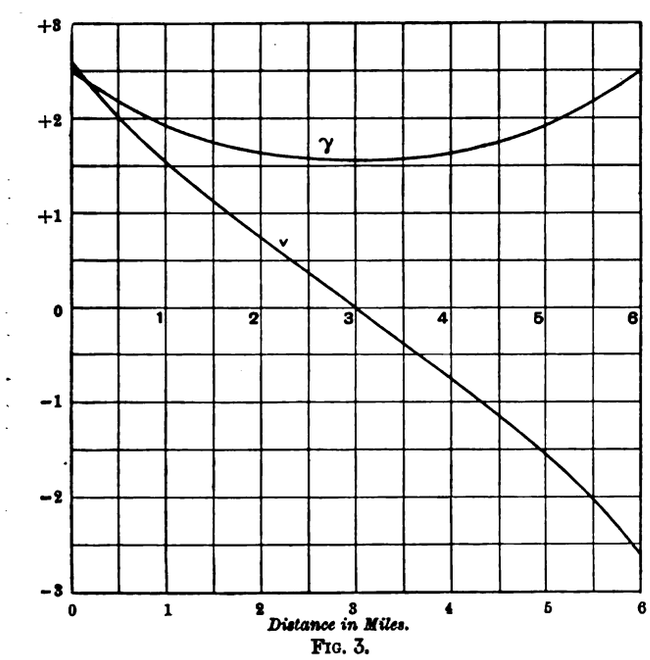

FIG. 3.

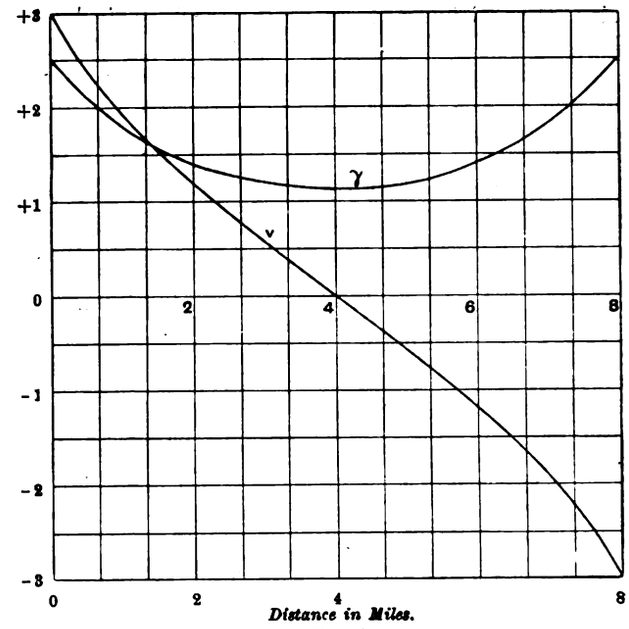

FIG. 4.

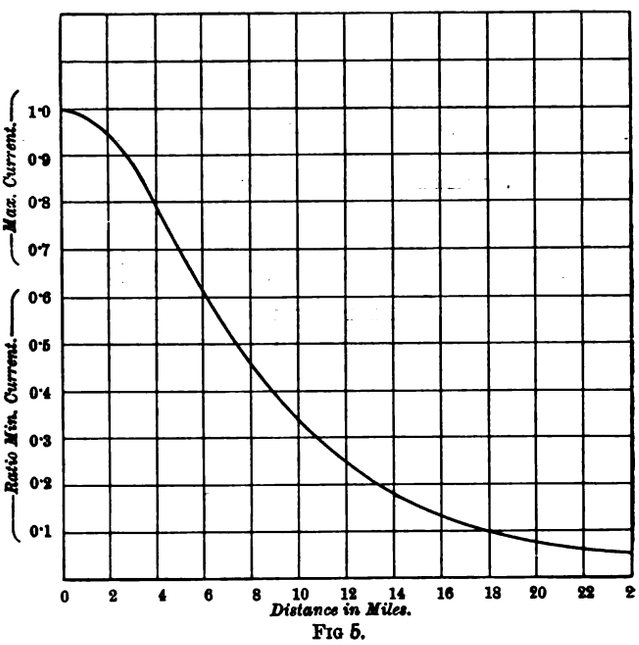

FIG 5.

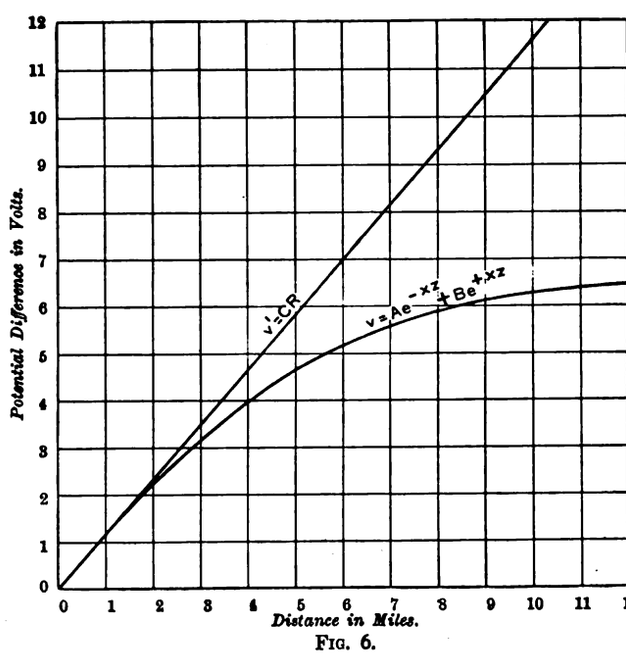

FIG. 6.

Digitized by Google

Resistance per joint with one 0000 bond is equivalent to, say, 30in. of rail (Mr. Parshall on "Earth Returns for Electric Tramways." *Proceedings* I.E.E., Vol. XXVII.*).

Resistance of 76lb. rail = 0·0637 ohms per mile.

$$\text{Total resistance of joints} = \frac{0{\cdot}0637 \times 1{,}056 \times 30}{63{,}360} = 0{\cdot}0318 \text{ ohms.}$$

Current density = 2·5 amperes per square inch.

C.R. drop due to joints = 18·25 × 0·0318 = 0·58 volt.

Potential difference for a length of 6 miles from Fig. 6 is 5·2 volts.

Total potential difference = 5·2 + 0·58 = 5·78 volts, a result which is sufficiently near to justify the process.

It should also be noted that the whole of the resistance to leakage is assumed to be at the contact of rail and earth; the equations are therefore more correct for long lengths than for short ones, as in the latter case the resistance of the earth itself will affect the result.

In the next place the conditions assumed result in symmetry as regards the current distribution. If, for instance, the line under test forms part of a larger system of rails, the zero point will be shifted on to that side on which there is a preponderance of metal, and the curves will not be symmetrical with regard to the section under test. Moreover, a proportion of the current will be dispersed on the one side and collected on the other by means of the rail surfaces in contact with the ground if connected to the rails of the electrical system, so that for the same total current the potential difference will be less than the values given. The corrections for these cases are easily applied on the assumption that the furthest limit of the rail system is at the same potential as the earth.

WAVE TRANSMISSION OVER NON-UNIFORM CABLES AND LONG-DISTANCE AIR-LINES.†

BY M. I. PUPIN, PH.D.

This Paper describes an experimental investigation of a method of constructing cables and long-distance air-lines for long-distance telephony and telegraphy. Transmission of electrical energy over conducting wires is a *wave transmission* when the distance between the transmitting and the receiving apparatus is sufficiently long to permit the development of electrical waves. Such a transmission exists in long-distance telegraphy and telephony. It does not exist to any practically appreciable extent in ordinary transmissions of electrical power by alternating currents over distances which up to the present time have been bridged over by electrical power transmission lines. In cases of wave transmission considered here the conductors will be called *wave conductors.*

Wave-length.—The velocity of propagation of electrical waves of telephonic frequencies over conducting wires may be anything, from the velocity of light down to a few inches, or even less than an inch per second, depending on the inductance, resistance, and capacity of the line. The smaller the velocity the shorter, of course, will be the wave-length for a given frequency. The *wave-length*, as will be seen presently, plays a very important part in this investigation. It is considered here as one of the characteristic constants of wave propagation. I am not aware that previous investigators of the propagation of long electrical waves have devoted any serious attention to this characteristic constant.

Attenuation Constant.—There remains another constant which with the wave-length completely defines electrical wave propagation. It is called here the *attenuation constant.* To bring out its physical meaning consider two consecutive half wave-lengths of any moment. The one nearest to the transmitting apparatus shall be denoted by A and the other by B. The wave energy stored up in the medium surrounding A is greater than that stored up in the medium surrounding B. Hence wave energy is gradually dissipated during its propagation from the transmitting to the receiving apparatus, and therefore the amplitude of both current and potential become smaller as the energy progresses along the transmission line. Let U be the amplitude of the current at the transmitting end, and U_s be the amplitude at a distance, s, then if the line be considered infinitely long

$$\frac{U_s}{U} = e^{-\beta s}$$

where e is the base of Naperian logarithms. The constant β is called here the attenuation constant. The mathematical expression for β is well known—

$$\beta = \sqrt{\tfrac{1}{2}pC[\sqrt{p^2L^2 + R^2} - pL]}$$

where L, R, C are the inductance, resistance, and capacity respectively of the wave-conductor per unit length, and p is the frequency speed. Much confusion exists in the minds of physicists as to the real significance of this constant, and as to the true cause of current attenuation. It is usually stated that the capacity of the line, acting, as it does, somewhat like a shunt, is the cause of all the trouble experienced in electrical wave transmission. This statement contains a small part of the truth only, and for that reason may and actually has become misleading. The fact that a conductor possesses inductance and capacity shows that the medium surrounding it is capable of storing up energy, which, indeed, is a blessing; it cannot possibly signify that energy propagated along it will be dissipated; and if capacity cannot cause a loss of energy, how can it possibly cause an attenuation of current? The dissipation is due to imperfect conductivity of the wire, and to that alone. Inductance and capacity regulate it, they do not cause it.

Consider now the manner in which this regulation is effected. The dissipation of the energy transmitted occurs at the time when it is stored up in the medium as magnetic energy; for if the medium surrounding an element ds of the transmission wire contains a quantity, dW, of magnetic energy, then a current, x, must flow in that element such that

$$dW = \tfrac{1}{2}Lx^2ds.$$

Let dH be the rate of dissipation in that element, then

$$dH = Rx^2ds.$$

Suppose now that by some means we increase L to n^2L, the medium surrounding the elements ds will store up the same amount dW of magnetic with one nth of the current, for

$$dW = \tfrac{1}{2}n^2L(x/n)^2ds.$$

Let dH_1 be the rate of dissipation in this case then

$$dH_1 = R(x/n)^2 ds = dH/n^2.$$

It follows, therefore, that during the transmission of a given quantity of energy over a conducting wire the dissipation will be diminished by increasing the inductance of the wire, for if the wire have high inductance then small currents are required to transmit a given quantity of energy, and small currents incur small ohmic resistance losses. By increasing the inductance the efficiency of transmission is increased just as effectively as by increasing the conductivity of the transmission wire.

Distortionless Wave Conductors.—Another important advantage is gained by increasing the inductance. The expression for β given above shows that attenuation depends on frequency; it increases with it. Hence, in telephonic transmission where waves of complex harmonic frequencies are propagated over the line there will be distortion of the waves, because upper harmonics will be attenuated more vigorously than the lower frequencies. This results in a distortion of speech, which is noticed in long-distance telephonic transmission as defective articulation. Some instructive experiments bearing upon this point will be described presently. High inductance obviates this difficulty. To illustrate: Suppose that the inductance is large in comparison to the resistance, the expression for β will reduce to

$$\beta = R/2\sqrt{C/L}$$

It is independent of the frequency. All frequencies are attenuated alike, so that high inductance not only diminishes attenuation but also renders the circuit distortionless. Such a circuit is the ideal circuit for telephonic and telegraphic wave transmission.

Mr. Oliver Heaviside, of England, to whose profound researches most of the existing mathematical theory of electrical wave propagation is due, was the originator and most ardent advocate of wave conductors of high inductance. His counsel did not seem to prevail as much as it deserved, certainly not in his own country. I trust that the physical view of attenuation described above in the terms of the dissipation of energy which is transmitted over the wire will help to elucidate Mr. Heaviside's theory of high inductance wave conductors.

Wave Propagation over Non-Uniform Conductors.—But Mr. Heaviside's proposition to employ wave conductors of high inductance contained a serious difficulty which his mathematical theory was not capable of overcoming. The difficulty is this: How can a wave conductor be constructed so as to have a high inductance? Ordinary circuits can be endowed by as much inductance as may be required by simply introducing a coil of proper dimensions, with or without an iron core, into it. But this will never do in the case of a wave conductor; for a coil introduced that way will act by reflection as a barrier to electrical waves. Acting on a suggestion made by Mr. O. Heaviside* in 1893, wave propagation experiments

over long wave conductors containing a certain number of coils in series at periodically recurring points have actually been tried by telephone engineers; the results obtained have invariably proved most disappointing. I shall return to this point later on in connection with the description of experiments given further below. Suffice it to state here that all attempts to increase the inductance of a wave conductor by the introduction of inductance coils at periodically recurring points failed, because they had no mathematical theory to guide them, so as to avoid the difficulties of wave reflection by inductance coils introduced that way. It is hardly worth while to enter here into a discussion of the many other attempts at increasing the inductance of a wave conductor by devices which had neither theory nor experiment to recommend them. In fact, most of them were absurd on the face of it.

The first mathematical theory dealing with wave propagation over conductors of this kind was presented by me before this Institute on March 22, 1899.* A more complete theory is given in the second part of this paper.† The main object of this theory is, find an answer to the question: *Under what conditions are the non-uniform conductors described equivalent to their corresponding uniform conductors?* The answer which the mathematical theory gives to the question just proposed is definite. To formulate it introduce here a convenient technical term. Consider the distance between two consecutive inductance points, that is, the points at which the inductance coils are introduced. Denote it by l, and let the wave-length which is to be transmitted be λ. Now introduce an angle ϕ such that

$$\phi/2\pi = l/\lambda.$$

The angle ϕ shall be called the *angular distance* between the inductance points, or inductance sources. The angular distance 2π corresponds to the wave-length. The law which determines the degree of equivalence between a non-uniform conductor and its corresponding uniform conductor can now be stated as follows: A non-uniform conductor is as nearly equivalent to its corresponding uniform conductor as $\sin\phi/2$ is to $\phi/2$.

It is evident that ϕ is inversely proportional to the wave-length, so that for a given distance between the reactance points the degree of equivalence diminishes as the wave-length diminishes. If a wave of complex harmonic frequency, such as occur in telephony, be transmitted over a non-uniform conductor, then the action of the conductor will be different for the different components of this complex harmonic wave. If, however, the non-uniform conductor acts with sufficient approximation as a uniform conductor toward the highest important frequency of this complex wave then its approximation to a uniform conductor will be even higher for the lower frequencies and thus for all the frequencies of the wave. A numerical example will illustrate this point more clearly. It is well, however, to state more fully the meaning of the expression "equivalence between a non-uniform conductor and its corresponding uniform conductor." All that we can predicate of a wave of a given frequency is that it has a certain wave-length and a certain attenuation constant. Hence, if a wave of a given frequency has the same wave-length and the same attenuation constant on a non-uniform conductor as it has on the corresponding uniform conductor then the two conductors are equivalent to each other. If these two quantities differ by, say, 3 per cent., then an approximate equivalence up to within 3 per cent. exists.

Consider now the following numerical example: A twin conductor, such as employed for telephone cables, has a length of 250 miles. Let its constants have the following values per mile:—

Inductance = 0.
Resistance = 9 ohms.
Mutual capacity = 0·074 microfarads.

According to the high but definite standard which the New York Telephone Co. employs the limiting distance of telephony over such a cable is 39 miles. According to the lower standard which is maintained in long-distance telephone work the limit would be 78 miles. The results obtained by me experimentally seem to verify these figures. I find that at a distance of 100 miles telephony over such a cable is very poor—in fact, impracticable—and at a distance of 125 miles impossible. It is proposed now to decrease attenuation and distortion over such a cable by the insertion of inductance coils at periodically recurring points. The attenuation constant β in this case is given by the formula‡

$$\beta = \frac{R}{\sqrt{2}}\sqrt{\frac{C}{L}}.$$

Say that it is required to have $\beta = 0{\cdot}015$. Assume that the introduction of the inductance coils adds 9 ohms per mile, so that R = 8 ohms. These values of R and C require L = 0·056 henrys. The attenuation factor at a distance of 250 miles would be $e^{-250\beta} = \frac{1}{40}$ (roughly). That is, 2½ per cent. of the current leaving the transmitting end will reach the receiving end. This is quite sufficient for telephonic purposes; but it should be observed that better efficiency of transmission could be obtained by making L larger. Notice now that the attenuation factor for this cable without the coils would be, for a frequency of 600 P.P.S., roughly, $\frac{1}{25\times10^4}$, that is, with a given initial current, the current at the receiving end would be 6,000 times larger with the coils than without them.

The next step is to find the wave-length for the highest important frequency in telephony over a *uniform wave conductor* having L = 0·056 henrys, R = 18 ohms, C = 0·074 microfarads. The best telephone practice assumes that 750 ∿ per sec. is the highest frequency of any importance. The wave-length corresponding to this frequency over a *uniform conductor* of this description is obtained from the formula:*

$$\lambda = \frac{0{\cdot}2\pi}{p\sqrt{2LC}} = 14{\cdot}6 \text{ miles},$$

approximately.

Suppose now that at each mile we place a coil of inductance L = 0·056 henry and a resistance R = 9 ohms. The angular distance ϕ for frequency 750 P.P.S. of the non-uniform conductor thus obtained will be $2\pi/14{\cdot}6$. The degree of equivalence of this non-uniform conductor to its corresponding uniform conductor is measured by the degree of equivalence of $\sin\pi/14{\cdot}6$ and $\pi/14{\cdot}6$. Now $\sin\pi/14{\cdot}6$ differs from $\pi/14{\cdot}6$ by less than 1 per cent. of the value of $\pi/14{\cdot}6$; hence for a frequency of 750 P.P.S. the wave-length and the attenuation constant on the non-uniform conductor will differ from the wave-length and attenuation constant on the corresponding uniform conductor by less than 1 per cent. of the values of these constants. Such a difference cannot be detected by any of the experimental methods which are at present available for investigating wave propagation. In telephonic transmission the ear could not detect it. For lower frequencies the differences will be even considerably smaller. Hence the non-uniform conductor thus obtained will represent a uniform, non-attenuating, distortionless conductor for telephonic transmission.

It should be observed here that in the case of a submarine cable of, say, 2,000 miles the attenuation constant should be much smaller than the value of β given above, in order to have a sufficiently small attenuation factor. Now the capacity per mile of a submarine cable is about four times as large as the capacity of the telephone cable just described. Hence, both on account of the long distance and also on account of the much increased capacity, the inductance per mile will have to be much larger than in the case just discussed. But high inductance and large capacity will give a very short wave-length. For instance, if in the case of the submarine cable having six times the capacity we employ an inductance six times as large as in the case of the telephone cable we shall obtain for the frequency of 750 ∿ per sec. a wave-length of only 14·6 ÷ 6 = 2·43 miles. Hence, since the inductance coils will have to be placed apart at one-sixth of the distance employed in the case of the telephone cable, the distance between them will be about 880ft. The distance between the inductance coils depends entirely on the circumstances of each particular case. But in all cases the rule given above contains the necessary and sufficient directions.

This rule and the method based upon it are recommended by the mathematical theory developed in Part II. of this Paper for the construction of distortionless wave conductors of high efficiency of transmission. It will be shown now in how far this theory is confirmed by experiment.

Description of the Experimental Cable.—A so-called artificial cable possessing the above constants was constructed by me for the purpose of testing experimentally the mathematical theory developed in Section III. of Part II. Previous experiments in this line will be found in the author's Paper of March 22, 1899, cited above.

The cable has 250 sections. One of these sections is represented in Fig. 1. It consists of a sheet, A, of paraffined paper. On each side of this sheet is a strip of tinfoil *ab*. The resistance of this strip is approximately 9 ohms. The capacity of the condenser formed by the two strips is 0·074 microfarads approximately; 250 sections of this kind connected in series represent a cable of 250 miles in length having a resistance of 9 ohms and a capacity of 0·074 microfarads per mile. That such is actually the case was verified experimentally, as will be shown presently. In Fig. 3 the straight lines A, B, C, D, A_1, B_1, C_1, D_1 represent these sections. The upper lines represent one side of the cable and the lower lines represent the other side. When the plugs are out, then the consecutive sections of the cable are connected to each other by the inserted coils. The plugs being in the coils are short-circuited. In this case we have a uniform cable; in the former case we have a non-uniform cable of

250 miles length, with inductance coils inserted at each mile. The coils are wound as represented in Fig. 2. The twin coils aa_1, bb_1, cc_1, of Fig. 3 are represented in Fig. 2 by coils *aa* and *bb*. These two coils are wound on one spool, and are separated by a sheet of cardboard indicated by a black line in Fig. 2 which is $\frac{1}{64}$in. thick. The coil when finished is boiled in beeswax at a temperature of about 280° F., in order to drive all the moisture out and ensure good insulation. Each coil had 580 turns of No. 20 wire B. and S. The average inductance of one of these coils is 0·030 henry, and the mutual inductance 0·028 henry. Each coil, therefore, when connected into the line, as indicated in Fig. 3, has an effective inductance of 0·058 henry. This method of bringing the corresponding coils of the two sides of the cable into close relation by mutual induction is not necessary; it is a matter of convenience and economy.

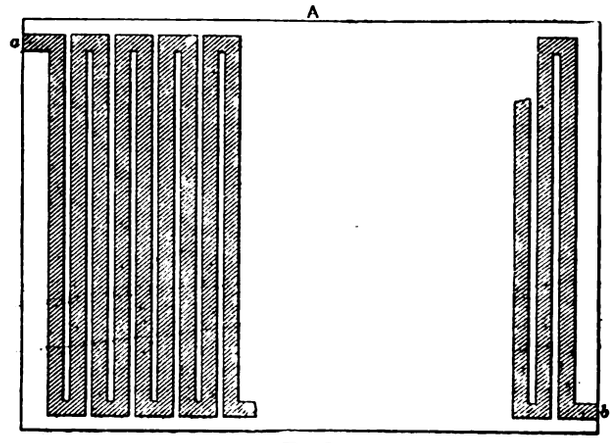

FIG. 1.

The cable sections are divided in five groups of 50 each, and each of these groups is enclosed in a separate box. Each box represents, therefore, 50 miles of the cable. Fig. 4 is a reproduction from the photograph of one of these boxes. The box marked A is the cable box. On two opposite sides are five rows B . . . . of binding posts, each row having 10 pairs. They are the terminals of the condenser sections. From these binding posts double cotton-covered wires which have been boiled in beeswax lead to the row of brass-plate couplers indicated in the picture by letters *a*, *b*, *c*, ... These boxes were made by the well-known mechanician, Mr. E. V.

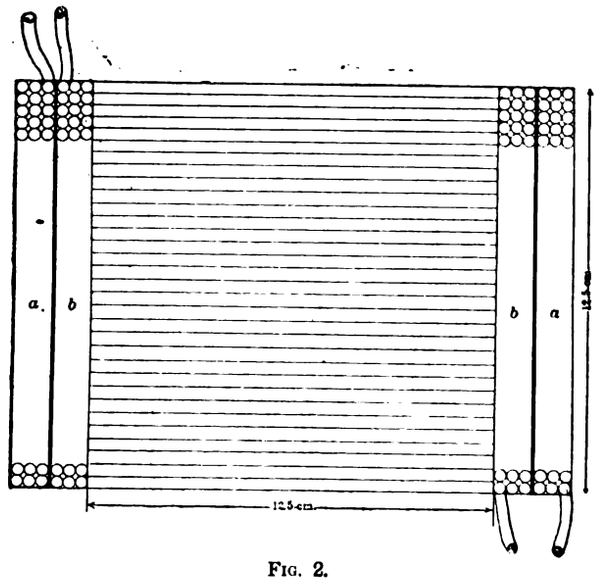

FIG. 2.

Baillard, to whom my sincere thanks are due for the keen interest which he took in this exceedingly laborious work. The rest of the work on the cable was done in the Columbia University laboratory for electro-mechanics. The insulation per section was about 50 megohms.

Telephony Over the Non-Uniform Cable.—Actual experimental tests with transmitters and receivers, which were kindly put at my disposal by the New York Telephone Co, for which I feel very grateful to them, verified my predictions completely. Telephonic communication over the whole of the cable was carried on with perfect ease. Both the volume and the articulation of the transmitted sound were all that could be desired. If, however, the inductance coils were cut out and the cable used as a uniform cable, then the transmission was good up to 50 miles, fair up to 75 miles, impracticable at 100 miles, impossible at distances over 112 miles. Increased distance interferes with the transmission over the uniform cable, not only on account of the diminished volume of the sound transmitted, but also on account of the rapid loss of articulation. This manifests itself at first as an apparent lowering of the pitch of the voice just as the theory demands it. My assistant's voice is of an ordinary pitch, if anything, a little above the pitch of the average man's voice. When it was transmitted over 75 miles of the uniform cable (that is, the coils being disconnected from it) it sounded like a strong baritone. Over a distance of 100 miles it

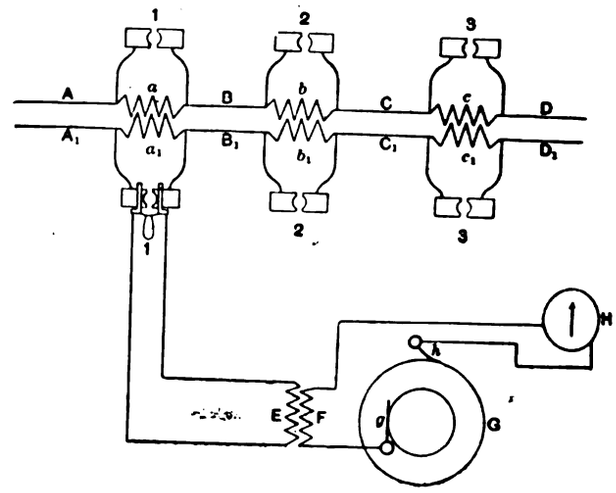

FIG. 3.

became so drummy—this is an expression borrowed from telephone engineers—that it was difficult to understand it, unless nothing but ordinary conversation was carried on, and then very slowly, and the speaker had to put his mouth as close to the transmitter as possible, and speak out as if he were addressing a big audience. At distances over 112 miles nothing but the lowest notes of the voice could be heard; the articulation was entirely gone. When the coils were all in, then no drumminess in the voice was noticed, and the conversation could be carried on as rapidly as one chose to do. I understand that in long-distance work three galvanic cells of the same type, of which I had two only, were formerly employed by the American Telegraph and Telephone Co., when they employed the old system of transmission.

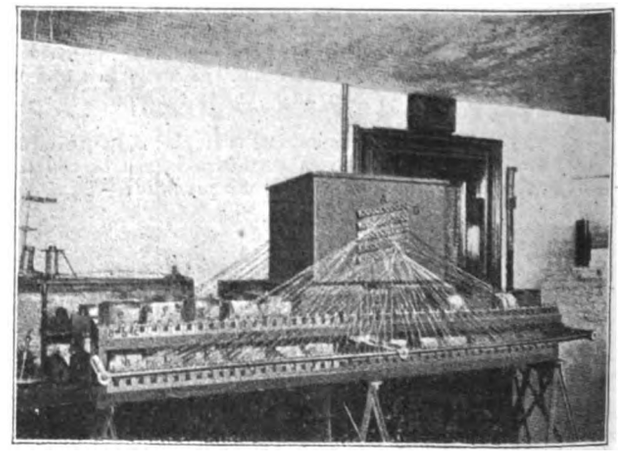

FIG. 4.

Effect of Internal Reflections upon Telephonic Transmission.—For this purpose the inductance coils were connected in groups of 10; one of these groups was inserted into the cable every 10 miles, so that the total inductance of the cable was now the same as before. The length of cable was therefore 100 miles. Telephonic transmission over this distance was absolutely impossible, although the lowest note in the voice was transmitted quite vigorously, and sounded like the muffled beating of a big drum. Another distribution of the coils was now tried. The coils were divided into groups of five, and these groups were put into the cable at points 5 miles apart. Transmission over a distance of 100 miles became intelligible, though with much difficulty; but it was not as good as over the cable

Digitized by Google

without the coils. The drumminess was even more excessive in the former case than in the latter. One had to put his mouth very close to the transmitter, speak very slowly, very loud, and about very ordinary things, otherwise the meaning of the transmitted intelligence would not be caught at all. But if the same distance of cable was employed with the inductance coils placed 1 mile apart, as the mathematical theory suggests, then the voice of the sender sounded just as if he stood right before the receiving operator. It was not necessary to stand near the transmitter at all, in order to be heard at the other end. There was no difficulty in making the receiving operator understand even if the transmitting operator stood anywhere in the room at a distance of 20ft. or more from the transmitting instrument. The effect of the inductance coils properly distributed over the cable upon the efficiency of transmission astonishes even one like myself, who have now worked for years upon and made myself perfectly familiar with this fascinating problem of electro-mechanics.

The inductance coils which I have so far described contain no iron. Coils with iron cores to be used for this purpose will have, of course, to be constructed in a perfectly definite way to work satisfactorily. I expect to bring this matter before the Institute at some future time. Suffice it to state now that such coils would be required in the construction of non-uniform submarine and underground telephone cables on account of the much smaller volume per unit of inductance. For long-distance air lines inductance coils without iron cores would be in many respects preferable.

In conclusion, I wish to thank my assistant, Mr. Cushman, and my students, Mr. Frank and Mr. Koscherak, for the very faithful and persevering way in which they have assisted me throughout these experimental researches.

It is of interest to add the following extract, taken from the *Electrical Review* of New York, of two American patents recently issued to Dr. M. I. Pupin for the "Art of Reducing Attenuation of Electrical Waves and Apparatus therefor."

Suppose it be required to transmit speech telephonically over a submarine cable 2,000 miles long. In this case inductance coils of small volume are preferable on account of considerations of mechanical construction. To secure high inductance with small volume, steel or iron cores should be used to avoid excessive ohmic resistance. Coils having iron cores are a source of three kinds of losses—viz., those due to Foucault currents, hysteresis and ohmic resistance. Each one of these losses has to be very small if the coil is to be efficient. I have found that this can be accomplished, at any rate, when it is required to transmit only small quantities of energy. If the core is finely subdivided, Foucault currents are negligible, especially for exceptionally weak magnetisations, such as will be employed in the case before us. It will now be shown that hysteresis also can be made negligibly small. Let the wire have a resistance of 5 ohms per mile. According to present cable construction the capacity per mile with wires of such size is very nearly three-tenths microfarad. Introduce inductance coils at proper distances, so as to make the inductance three-tenths henry per mile, and suppose that these coils add 1 ohm per mile, thus increasing the ohmic resistance to 6 ohms per mile. The wave-length for a frequency of 1,500 periods per second will be 2 miles, approximately.

To secure a close approximation to the rule, it will be necessary to introduce 16 coils per wave length or eight coils per mile. The inductance of each coil will then be 0·0375 henry. The resistance of each coil will be 0·0125 ohm. Employing cores of iron, or well-annealed steel, coils of this inductance can be readily made which will be small enough to go within the sheathing of a submarine cable as these are constructed to-day and at the same time show negligibly small Foucault current and hysteresis losses.

In Fig. 6 X′ is a ring-shaped disc. Its internal diameter is 2·5cm. and its external diameter is 6·5cm. Its thickness is 0·002cm., or about 0 005in. It has a narrow slit, *pq*. A core is built up by piling together a sufficient number of such discs to give the required length, which we will assume is 10cm. In Fig. 5 a transverse section of such core is represented. Wind this core with two layers of wire having 8·5 ohms resistance per mile. Let each layer have 48 turns. The length of the wire will be 80ft., and its ohmic resistance will therefore be little more than 0·125 ohm. Eight coils per mile will therefore add 1 ohm per mile to the resistance, making the total resistance 6 ohms per mile. To calculate the inductance, the permeability of the iron must be known. In telephony the maximum value of the current at the sending station is generally less than 0 0001 ampere, or 0·00001 unit of current in the centimetre-gramme second system. The magneto-motive force of the magnetic circuit is for this value of the magnetising current

$$M = 4\pi sC = 4\pi \times 96 \times 10^{-5}.$$

The intensity H of the magnetising force will be

$$\frac{M}{l} = H,$$

where l is the mean length of the magnetic circuit equal to 10cm., roughly. Hence

$$H = \frac{4\pi \times 96}{10^{6}} = 0{\cdot}0012.$$

For excessively feeble magnetising forces of this kind the magnetic permeability of first-class iron is about 180. The intensity of magnetic induction will be $B = 180 \times 0{\cdot}0012 = 22$ lines of induction per square centimetre. At this excessively low induction there is no hysteresis. The inductance of the coil can now be easily calculated. The formula is

$$L = \frac{4\pi s^2 q\mu}{l \times 10^{9}},$$

where

s = number of turns = 96.
q = cross-section of core in square centimetres = 20.
μ = permeability × 180.

Hence $L = 0{\cdot}042$ henry.

The diameter of the coil, when finished, will be less than 2·5in. and its length 4·25in. Such a coil can be placed conveniently within the sheathing of a submarine cable. Its diameter can very easily be reduced by increasing its length.

It should be observed here as a warning that unless inductance coils with iron cores are constructed in such a way as to keep down the magnetisation, hysteresis, Foucault current losses and distortion of current by the varying value of the magnetic permeability at each cycle of magnetisation will work disastrously. The limit of magnetisation permissible will not, however, be passed even if the magnetising current is 30 times as large as is assumed above—that is, the magnetising current can be as high as 3 milliamperes—a strength of current which is capable of operating telegraphic apparatus. It should also be observed that the iron core

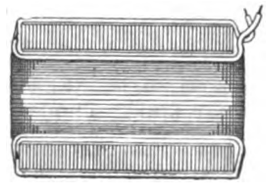

Fig. 5.

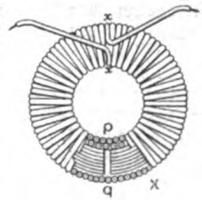

Fig. 6.

represented in Figs. 5 and 6 can be made by winding very fine iron wire, the plane of the windings being perpendicular to the axis of the cylindrical tube which constitutes the core. The advantage of this core is that it still further reduces the Foucault current losses, and also prevents magnetic creeping. The cross-section of the wire core would have to be made larger than that of the plate core to allow for the more imperfect filling up of the available space by the substance of the wire.

Electric Tramway in Astrachan.—The Astrachan electric tramway was opened to the public on June 11 last. It is a single-track network connecting the most important points of the town and harbour and some of the suburbs, its total length being 12½ miles. The electrical and mechanical equipment has been carried out by the St. Petersburg branch of Messrs. Siemens & Halske, and includes three 200 kw. sets consisting of internal pole machines running at 200 revs. per min., driven through belting by compound steam engines. There is also a 50 kw. set for the station lighting. The tramway pressure is 500 volts. A feature of the station is that the three boilers, each of 2,150 sq. ft. heating surface, are constructed for naphtha fuel. The ordinary Siemens' sliding-bar system is employed on the line, there being two trolley wires of 8·2mm. diameter.

"ELECTRICIAN" SERIES FORTHCOMING BOOKS.

THE ELECTRIC ARC.—By Mrs. Ayrton. This work is in the press, and will contain an historical sketch of the early experiments on the electric arc, as well as the important results of recent research.

PRIMARY BATTERIES.—A work on this subject will shortly be published bringing the theory and practice of the Primary Battery up to date. The book will be fully illustrated.

SECONDARY BATTERIES.—By E. J. Wade. Fully illustrated. The Author in this work will deal briefly with the theory and fully with the chemistry, design, construction and manufacture of secondary batteries or accumulators.

"THE ELECTRICIAN" WIREMAN'S POCKET-BOOK.—Edited by F. C. Raphael. "The Electrician" Company will shortly publish a valuable pocket-book for the use of those engaged in wiring work, both external and internal.

THE TELEPHONE.—By Dane Sinclair and F. C. Raphael.

SPECIAL NOTICES.

NOW READY.—Vol. XLIV. of "The Electrician" (950 pages), bound in strong cloth. Price 17s. 6d., post free 18s. 6d. Also ready, Cases for binding. Price 2s., by post 2s. 3d.

A complete set of "The Electrician" (1878-1900) can now be supplied. These sets are very scarce, and early application should be made.

NOW READY.—"THE ELECTRICIAN" READING CASE. Holds four copies of the Journal. Strongly made and corded for hanging. Price 1s.; post free, 1s. 4d.

RIVAL DISTRIBUTION SYSTEMS.

When the Council of the Municipal Electrical Association arranged the programme of the recent convention of this Society they cannot have made themselves acquainted with the contents of the various Papers sent in. If they had done so they would hardly have set down two Papers on entirely different subjects for discussion at the same time, while one of these Papers dealt with the same problem as a Paper which had been read and discussed on the previous day. Mr. L. Andrews' Paper on "The Distribution of Electricity to Scattered Areas" was a polemic devoted to the alternating *versus* continuous controversy, while Mr. Boor's Paper, read the day before, dealt with the most important problem in connection with it, viz., the reduction of all-day losses on alternating-current systems. Mr. Wilkinson's Paper, on the other hand, was on the details of distributing systems, such as the methods of laying cables, the choice of junction boxes, and similar matters. It was most interesting and would probably have led to a highly instructive and technical discussion, had it been taken separately; but in the discussion that did take place it was overshadowed by the greater importance of the problem raised in Mr. Andrews' Paper. Mr. Andrews is a staunch champion of alternating-current distribution, so much so that he considers Hastings and St. Leonards to be still a "scattered" area, and is of opinion that for this district a continuous-current system would be less economical. Some of Mr. Andrews' items in his comparison of the estimated costs of the two systems were severely criticised by Mr. J. F. C. Snell, who was supported by Mr. Wordingham, but we think that, even after Mr. Snell's taxation, the costs of the continuous-current system were allowed to remain too high. For instance, those engineers who have had experience with both low and high-pressure mains will agree that, for the same district, the cost of repairs and maintenance of feeders is higher with high-pressure than with low-pressure systems, whereas Mr. Andrews' figures assume merely a higher percentage on the outlay, which works out to a lower sum for high pressure than for low pressure. And then he also includes in this figure the repairs and maintenance of the sub-stations, and of their equipment, which,

Digitized by Google

even without the complicated switch gear he proposes to employ, will probably alone be quite as great as the maintenance of the feeder system of a continuous-current network. Then, to judge by the table in Mr. Boot's Paper, referred to in our last issue, the possibility of a reduction of the light load losses from 540 units to 40 units a day in 17 sub-stations is by no means certain, even with the ingenious devices proposed by Mr. Andrews. A sum must also be put down to the high-pressure account for a proportion of the wages of the switcher-off. What is probably more important than all is the loss, which is not so easily calculable, accruing from the diminished load factor owing to the relatively few motors that will be attracted to an alternating-current system. A supply area tends to become more concentrated as time goes on, and, consequently, we are of opinion that, with the methods at present at the disposal of the electrical engineer, an alternating-current system should only be recommended for *distribution* in an area much more "scattered" than the typical one chosen by Mr. Andrews, and even then a two-phase or three-phase system would probably be preferable to one on the old single-phase lines.

REVIEWS.

Copies of any of the undermentioned works can be had from *The Electrician* office post free, on receipt of published price.)

Magnetic Induction in Iron and other Metals. By Prof J. A. Ewing. 3rd edition. "The Electrician" Printing & Publishing Co 1900. 10s. 6d. net.

Not quite nine years have passed since Prof. Ewing first published his work on Magnetic Induction, and the fact that he is now called upon to issue a third edition is satisfactory evidence that it still maintains the position which it rapidly gained for itself on its first appearance as a leading text book on the subject.

Good in all respects as the earlier editions were, this new edition should be still more popular. For not only is the work brought up to date by the incorporation of the results of the many valuable investigations made on the subject during the intervening period, but in addition there is a new chapter on "Practical Magnetic Testing" which will prove most acceptable to all practical electrical engineers. No one has done more than Prof. Ewing in applying theory to practice, and his success is seen in the series of beautiful testing instruments which he has devised, and which are fully described in this chapter.

His "permeability bridge" is especially neat and simple. In its action it is analogous to the Wheatstone bridge for measuring electrical resistances. The bar to be tested is compared with a standard bar whose B-H curve is known. The same current passes in series through the magnetising coils of both bars; but while the number of turns on the coil round the standard bar is fixed, the number on that round the test-bar is adjustable. The bars are connected together at each end by a short yoke, and a detector shows any inequality in the induction in the two bars in this circuit. The adjustment of coils to obtain exact equality is made by moving a switch over contacts on a dial, compensating resistances being thrown in or cut out by this single movement as the number of coils is decreased or increased. The usual arrangement is that a current of one ampere gives a force of 10 units in the standard bar; so that for any given induction, the force necessary to produce that induction in the standard is first read off from its B-H curve, the current is adjusted accordingly to the proper amount to give this force, and when equality between the bars has been established by adjusting the coils, the magnetic force required to produce the given induction in the test-bar is at once known by multiplying the magnetic force in the standard by the ratio between the number of coils on the test-bar to that on the standard. This latter is usually 100, but it may be changed to 50, in which case the magnetic force in the standard bar will be 5 units per ampere.

Descriptions are also given of the author's magnetic balance and his hysteresis tester, and of Du Bois' magnetic balance. These descriptions will certainly make the book still more attractive to practical men, and the student of theory will find a careful perusal of them to be an excellent means of fixing the theory in his memory.

The other chapters of the book, as already indicated, are brought up to date by the inclusion of the results of the most recent investigations. Perhaps the most interesting addition of this kind is found in the chapter on "Molecular Theory," giving an account of Prof. Baily's experiments on hysteresis of iron in a rotating magnetic field. We may quote the author's own words: "The conclusion that hysteresis should vanish when iron is rotated in a very strong field seemed at first so improbable that it was advanced by way of criticism of the author's molecular theory. Mr. Baily's demonstration that hysteresis does, in fact, nearly vanish may be claimed as going far to prove its fundamental soundness." In applying his molecular theory to account for the loss of magnetic quality in iron when the temperature is high, the author makes a "plausible conjecture" that the oscillation of the molecules is then so violent as to amount to *rotation*. It may be of interest however to mention that, on the other hand, Mr. J. S. Townsend ("On Magnetisation of Liquids," *Phil. Trans.*, 1896, second half-year) has suggested the same idea of rotating molecular magnets to account not for absence of magnetic quality, but for diamagnetism. For "if we take the simple case of a magnet rotating rapidly in the horizontal field of the earth the effect of the applied force H will be to make the north-seeking pole move more slowly when it is south of the axis of suspension than when it is north, so that its mean position is south of the axis of suspension, thus causing the magnet to act like a diamagnetic body."

The book is very clearly printed and very few printers' errors appear. The references to Papers are very complete. It is too often considered sufficient by writers, in referring to a scientific journal or to the publications of one of the learned societies, to give only the number of the *volume*, whereas the really important point is the *year*, not only as fixing the date of publication, but also for convenience in reference. Both volume and year should be given, and except in a few instances Prof. Ewing has been careful to do this.

W. C. H.

Die Sicherungen von Schwach- und Starkstrom-Anlagen gegen die Gefahren der Atmosphärischen Elektricität. By Dr. Friedrich Niessen. (Braunschweig: F. Vieweg and Son. 1899). 5M.

As it deals with no other subject than the protection of electrical installations from damage by atmospheric electricity, this little work may be cited as an excellent example of the present tendency towards extreme specialisation in electro-technical literature. On the question whether the lightning discharge is oscillatory or not the author takes up a somewhat unstable position upon the proverbial fence:—

> What we know of condenser discharge certainly speaks against oscillation of the actual lightning spark. The clouds which hold one part of the charge do not form short metallic circuits, and just as little does the earth do so. But one has to do with water resistance in the discharge circuit, and so it follows from theory and experiment, that the discharge is always in one or several strokes following shortly after one another without oscillations. If, however, the conception that the actual lightning stroke between cloud and earth has an oscillatory discharge is to be put aside, it must yet be allowed that in the conductor to which the lightning conductor is connected, or in the actual material of the latter, electrical oscillations can ensue, particularly as soon as a stemming of the discharge of electricity,—perhaps in consequence of discontinuities—occurs. The whole conductor is charged by the electricity of the cloud; the one kind of electricity cancels itself with the electricity of the cloud, the other must be led away harmlessly by the lightning conductor. For this latter, a state of oscillation can very well occur.

However, whether we have to consider an oscillating discharge, a sharp fall of potential from a high value to zero, or several discharges of the latter nature following one another in succession, the effects of resistance, capacity, and self-induction are in the same direction, and the design of lightning guards is hardly affected by these considerations. The above therefore detracts nothing from the

Digitized by Google

conscientious descriptions of a large number of well-known and also of less familiar patterns of lightning protectors which follow. In the remainder of the book a few pages are devoted respectively to a catalogue of cases of damage done by lightning to electrical installations, an account of experience obtained with some of the apparatus described in the book and of some miscellaneous experiments, and lastly, an enumeration of some points to be considered in choosing and fixing lightning protectors. In the last chapter, however, the recommendation attributed to Dr. Görges, that the frames of machines should be insulated and not earthed, cannot be endorsed.

Elektrometallurgie und Galvanotechnik. By Dr. Franz Peters 4 Vols. (Hartleben: Vienna, Pesth, Leipzig.)

Dr. Peters's object in bringing out these volumes has been to give as complete a *résumé* as possible of what has been published up to date in the journal and patent literature of all countries, on the recovery and working of metals by electrical processes. The need of some such work has been felt both by electro-chemists and metallurgists, and also by inventors when they have desired to ascertain the novelty or otherwise of processes which they may wish to patent. The present book forms a convenient illustrated handbook to the literature in question, and should save much of the time which is often wasted in hunting through specifications in the Patent Office. In the case of the patent literature the author claims that no material omissions have been made, and that the list is substantially complete. A claim of this sort it is of course for a reviewer impossible to verify, but it appears to be justified so far as those patents are concerned which have led to marked industrial developments. In the case of the more important German patents, only unnecessary diffuseness has been omitted, because the author feels justified in giving them more or less in full when they contain important observations or comments on the process, even though these latter may not form the subject of claims. The German patent claims have been given verbatim in all cases, and in many instances criticism is appended. With regard to the journal literature also, every care has been taken to make it complete, but it is naturally only in a condensed form, and often only the reference is given.

The work is comprised in four volumes, which appear simultaneously, and the first volume deals with the metalloids and the light metals. The alkalies and alkaline earth metals are not included, as they have less interest for metallurgists than for chemists, and they have already been dealt with by the author in his work on "Applied Electro-chemistry." More than half of the volume is devoted to aluminium, and the remainder to antimony, tin, bismuth, beryllium, and magnesium. The second volume is entirely taken up with copper, and begins with a short history of electro-metallurgy, from which we find that electro-plating with copper was apparently understood by the ancient Egyptians, as a number of clay figures have been found in the graves at Thebes and Memphis which appear to have received an electrolytic coating of copper. In the fifth century Zosimus recorded that iron would separate copper from a solution of copper sulphate, and in the fifteenth century Paracelsus mentioned that a copper plate might be silvered by dipping it into a solution of silver. After this the references to similar facts become more frequent, but it was not until 1837 that Jacobi succeeded in depositing copper by the aid of the electric current. The various improvements which have been effected, since the early days of Elkington and De la Rive down to the latest processes for simultaneously depositing and burnishing copper on revolving cathodes, have each received their due share of notice. The third volume deals with silver and gold, and the chapter on the latter metal is especially valuable at present in view of the efforts which are being made to devise processes for working poor ores and for working up residues. Zinc, lead, nickel, and cobalt occupy the fourth volume, which also contains the subject-matter and authors' name index for all four volumes.

Manuel de Télégraphie et de Téléphonie. By J. Pierart. New edition. (Brussels: Hayez. 1899.)

This is a small book on electricity in its applications to telegraphy and telephony. Half of the 320-page volume being devoted to quite elementary instruction, the remainder cannot deal exhaustively and in detail with all the technical parts of the subject. Thus, although a large number of instruments are described, including the Hughes type-printing telegraph and the Wheatstone automatic, and a chapter is devoted to simultaneous telegraphy and telephony, extremely small space is given on the other hand to line construction, submarine telegraphy, multiplex telegraphy, fault localisation and multiple telephone switchboards, and they are dealt with quite inadequately. The book is presumably intended to teach the ordinary telegraph or telephone clerk something of the technical side of the subject, and if it does not aim higher than this, it should be successful. As a book of reference, it is handicapped by the absence of an alphabetical index.

Les Arbres à Gutta Percha: Leur Culture. Mission relative à l'Acclimatation de ces Arbres aux Antilles et à la Guyane. By Henri Lecomte. (Paris: Georges Carré et C. Naud. 1899.) 2fr.

The first part of this pamphlet is devoted to a botanical description of the various gutta percha plants, a brief summary of the methods employed for extracting the gum, and some interesting historical and statistical information. The second part is a detailed report (presented to the French Colonial Minister) of the author's introduction of the gutta percha plant into Guadeloupe, Martinique, and French Guiana. In all cases the plants were from a consignment brought to Marseilles by the late M. Raoul from the Dutch Indies and Sumatra. Up to the date of the report, all have been doing well; but the time is as yet too short for a definite opinion to be formed as to the probability of the acclimatisation of the gutta percha plant in the localities chosen.

Résistance Electrique et Fluidité. By Gouré de Villemontée (Paris: Gauthier-Villars.) Boards, 3Fr.; paper, 2Fr. 50c.

The author gives in this little volume a *resumé* of the experimental work done to show the connection between electric resistance and the internal friction in liquids. Although the book is in the main devoted to the work of others, the author is evidently thoroughly at home in his subject, and shows considerable ability in its exposition. A valuable feature of the book is the completeness of the references to the original articles of the various investigators.

DIRT MARKS AND ELECTRICAL CONDUCTORS.

BY PROF. F. G. BAILY.

In connection with a recent article by Mr. Campbell Swinton (*The Electrician*, April 27, 1900) on the subject of the accumulation of dirt by electrical conductors, I venture to bring forward some further remarks on the subject, as I have had the phenomenon under observation for some time on a large scale with varied conditions, and the results are therefore fuller and more conclusive. While agreeing fully with Mr. Campbell Swinton that the effect is due to electrostatic action, I may point out that he makes an error (though perhaps only a verbal one) in talking of positive and negative. The following observations show that the sign of the potential with regard to the earth is without or almost without influence on the result.

The system in Edinburgh is three-wire continuous current, with the middle wire earthed at the station and 230 volts on each side. Therefore the line wires are positive or negative to earth according as the circuit is connected to the positive and middle or negative and middle. An examination of several hundred lamps in various supports that have been erected for about 18 months, showed that the deposit of dust round fittings or conductors was very small in all cases in which the switch was on the live side, though a certain amount of dirt had collected when the conductor passed very close to the ceiling or wall, as for example where flexible passed through eyes. When the switch was on the earthed side the deposit was always large and extended several inches from the conductor. Ceiling roses flexible, and the lamp holders were the most usual obvious cases, but even metal fittings produced the same effect if insulated from the wall. Two movable metal brackets mounted on wooden stands which hung from hooks on the wall showed the same dust marks round the base, and even a piece of string which hung

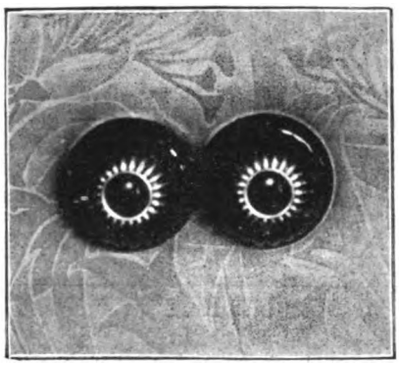
Digitized by Google

from one of them had a line of dust opposite to it on the wall. These were both on the live side, and the effect is clearly due to leakage from the terminals of the lamp holder over the porcelain insulator to the metal part of the bracket, as there was no direct contact between them. The base of the bracket was of very well seasoned wood polished on all parts, and the room was a particularly dry one, so the conditions were favourable to the retention of electricity on the bracket.

No regular difference could be definitely observed in positive and negative circuits, but there was an indication that the deposit was more on the walls on the negative side, while on the positive side the fitting seemed more covered. This would indicate that the positive charge attracted the dust more than the negative charge, but the difference was not great.

Owing to the difference of potential between the live body and the earth there will be an electrostatic field between them, a charge of electricity positive or negative on the body, and a corresponding negative or positive charge on the earth in the immediate neighbourhood. Any small light objects in the surrounding air will therefore be attracted to the charged surfaces. As Mr. Swinton points out, it can be almost completely stopped by putting the switches on the live side (not necessarily the *positive*, however), for when the lamps are burning the live and earthed conductors are very close together, and the earthed conductor forms the nearest earth for the opposite charge. When the conductors pass very close to the ceiling some of the charge is on the ceiling itself, and hence a small amount of deposit is formed there.

The rapid collection of dust on flexible that is on the live side is due to the fact that, when the switch is off, the whole of the flexible is charged with one charge, and the lines of force



radiate into the air, drawing dust to the body from a large area, while with the switch on the live side, not only is the current on for a small portion of the day, but the two wires are oppositely charged and the lines of force are concentrated between the two, as in two parallel cylinders close together, and hence the area of dust-laden space that is acted upon by an appreciable field is very small. Dust does collect on these, but to a very much smaller extent.

The effect is extremely well shown with switches which are fixed to the wall without projecting back blocks of wood. Round all of these there is a very marked ring of dirt on the wall paper, with a thin line of clean paper close to the porcelain base, as shown in the accompanying photograph. There is evidently slow leakage from the live parts to the metal cover, which is highly insulated from earth by the porcelain base, and also slow creeping of the charge down the base, so that the whole surface is electrified. The thin line of clean surface, which seems to be always present, is possibly caused by the field being very intense where the charges are so close together, causing the charged particles to be shot off again by electric repulsion.* That the marks were not due to the housemaid's duster was clearly shown by the fact that electric bell pushes and gas brackets on the same walls showed no signs of dust marks. Where a switch is near to a side wall the mark appears at the place nearest to the cover, and where the switch is fixed on to narrow casing without any back block the dust appears under the projecting base. The effect is much less marked where polished wood blocks are used, since the dust does not stick to the polished surface and is blown off, or perhaps is repelled off again, and the wall beyond is almost out of reach. Glazed paper and varnished wood wainscotting are almost free from marks.

Since the switch must necessarily be alive, it is a matter of some practical importance, for switches are frequently placed straight on to the wall paper in drawing rooms and other carefully decorated places, and a wall paper is spoilt in a few months. The switch cover should therefore be earthed by being brought down outside the base, so as to enclose it completely. No electrostatic effect can then take place, for the charge will leak away to the wall as fast as it leaks over the insulation inside. It is true that this will lower the insulation of the system, since the insulation in most patterns of tumler switch between the handle and the live parts is somewhat thin. The following test on a small house of 34 lights shows this very clearly. Testing to earth with all wires connected and lamps in, the insulation came out at 50 megohms with a pressure of about 450 volts. The handles of 10 switches were connected by a wire to a good earth, and the insulation dropped to 15 megohms. With a different set of eight switches earthed it fell to 9 megohms, and with 21 switches earthed it fell to 5 megohms. None of the switches were faulty, and they were nearly new and two of the best patterns in the market. They form, however, an undoubtedly weak part in the installation, which is otherwise excellent.

Now that 230 volts is a common pressure I think there is a real need for improvement in the tumler switch; for with the earthed return, which is also becoming usual, a person with delicate hands who is sensitive to shocks may easily receive very unpleasant information that a switch is poorly insulated. The insulation afforded by the base is a bogus and illegitimate once, since it is outside of a part which is intended to be dead, and I trust that some manufacturer will supply a switch that will not give shocks nor make dust marks, one that has an earthed cover and sound ample insulation inside. If the dust question is not heeded, electric lighting will lose some of its claim to be the cleanest form of illuminant.

* Since writing the above I find a reference to this clean space in the "Electrical Researches" of Cavendish, Art. 308, wherein he mentions that on repeatedly charging and discharging a glass plate covered with tin foil a fringe of deposit is formed on the glass with a clean interspace of $\frac{1}{16}$in. He concludes that this is the distance to which electricity spreads instantaneously—a step in his theory to account for his observation that the capacity of flat plates is not strictly proportional to the surface. I think, however, that, though the results are singularly similar, the causes are different. The marks he observed would be caused by the brush discharge from the edge of the foil tearing off particles of metal, which would be repelled beyond the space electrified by the brush discharge. In the case of the switchbases the cause may be that given above, or possibly there may be a discharge of electricity between wall and switchbase where they are very close together, the discharged part not collecting dust.—F.G.B.

THE DISTRIBUTION OF ELECTRICITY TO SCATTERED AREAS.*

BY L. ANDREWS.
(Borough Electrical Engineer, Hastings.)

A few years ago if a scattered area was mentioned in connection with the distribution of electricity, everyone would have known, without further explanation, that reference was made to a district covering an area of a few square miles but very sparsely populated. At the present time, however, a scattered area to many electrical engineers means a district containing a number of towns, several miles apart, all supplied from one generating station. This Paper will, however, be confined to the question of supplying electricity to the old-fashioned scattered area. It will also be old-fashioned in another respect, for it will deal with the old and many-times discussed question of alternating currents *versus* continuous. Until comparatively recently the advocates of the respective systems have each been willing to admit that neither system was altogether best; that the system best for one town was quite unsuitable for another. But with the successful introduction of high-voltage lamps, many of the continuous-current advocates are again attempting to claim that there is not a town in the country that could not be more advantageously supplied by continuous currents than by alternating. Others, on the contrary, still contend that a large and scattered district can be fed more economically by high-tension alternating currents than by the extreme limit of low-pressure supply yet sanctioned by the Board of Trade. To compare the merits of the two systems, it is necessary to consider: (*a*) The

* Paper read before the Municipal Electrical Association, at Leeds, June 23.

Digitized by Google

relative capital outlay involved; (*b*) the relative annual cost of upkeep; (*c*) the comparative reliability of each system.

Instead of taking a hypothetical case for these comparisons, it is proposed to consider the relative merits of the respective systems for the purpose of supplying current to a definite area, viz., that of the borough of Hastings. The cost of the distributing networks will not be taken into consideration, as it is assumed that it would be the same for either system. The positions of the feeding points on the distributing networks would also be approximately the same in either case. To provide for the immediate future requirements 17 feeding points are required; these are generally from 800 yards to 900 yards apart. The generating station is in the centre of the borough and about 4,000 yards from the furthest feeding points. It is estimated that the average maximum demand on each feeder will be about 100 kw. The daily load factor will probably be about 10 per cent., or equivalent to 2½ hours' daily use of the maximum demand. For the low-pressure scheme it is assumed that a single independent triple concentric feeder would be run direct from the generating station to each of the feeding points; that all feeders in which the drop was less than 10 per cent. would be connected direct to the generating 'bus-bars, which would be maintained at a pressure 10 per cent. above the declared pressure of 250 volts across each side of the three-wire system; that all feeders in which the drop exceeded 10 per cent. would be supplied from other 'bus-bars boosted up to compensate for the increased drop, and that in all feeders in which the pressure at the feeding points exceeded the declared pressure by more than 2 per cent., a resistance would be inserted to compensate for the excess of pressure.

The following table gives the actual length of the feeders required for lighting the district referred to, and other particulars *re* same. For the high-pressure scheme it is assumed that a sub-station would be erected at each of the feeding points and equipped with transformers, to transform from 2,000 volts down to 500 volts or 250 volts; that instead of running independent feeders to each sub-station, a pair of feeders in duplicate would feed five or six sub-stations as shown diagrammatically in Fig. 1.

(*a*) *Capital Outlay.*—It is estimated that the capital outlay necessary to carry out the respective schemes referred to above would be as follows:—

To cost of laying and jointing the undermentioned cables, complete with necessary trench work, troughing, and pilot wires, &c.:—	L.T.		H.T.
7,420 yards of 0·036 H.T. concentric in duplicate, at 14*s.* per yard	—	...	£5,200
2,700 yards of 0·062 H.T. concentric in duplicate, at 18*s* per yard	—	...	2,250
5,100 yards of 0·15 H.T. concentric in duplicate, at 23*s.* per yard	—	...	5,870
1,000 yards of 0·2 H.T. concentric in duplicate, at 25*s.* per yard	—	...	1,250
3,720 yards of 0·2, 0·1, 0·2 triple concentric at 14*s.* per yard	£2,600	...	—
7,300 yards of 0·3, 0·15, 0·3 triple concentric, at 18*s.* per yard	6,560	...	—
25,600 yards of 0·4, 0·2, 0·4 triple concentric, at 22*s.* per yard	28,180	...	—
To cost of building 17 sub-stations	—	...	1,700
To cost of 68 30kw. transformers	—	...	5,100
To cost of sub-station switchgear	—	...	3,400
To cost of feeder switch panels at generating station	1,700	...	300
To cost of continuous-current boosters	1,950	...	—
Balance in favour of H.T. scheme	—	...	15,920
	£40,990	...	£40,990

(*b*) *Annual Cost of Upkeep.*—Under this heading the following items should be considered: 1. The interest and sinking fund on the capital outlay. 2. The cost of repairs and attendance to mains and distributing apparatus. 3. The cost of energy wasted in distribution. It is assumed that the interest and sinking fund would amount to about 7 per cent. per annum on the capital expended. The cost of repairs, &c., to mains is taken at 3 per cent. per annum

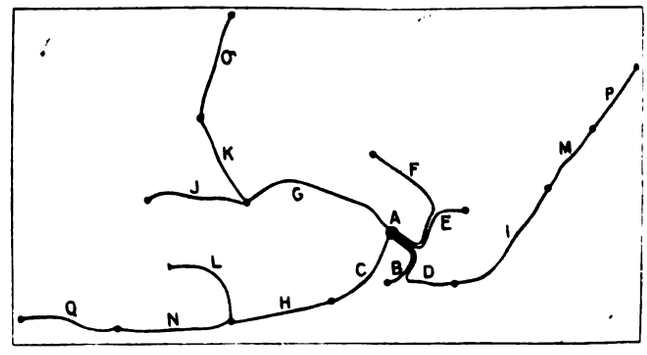

FIG. 1.

in the case of the H.T. scheme, and 2 per cent. per annum for the L.T. scheme. In considering the third item, the energy wasted in distributing networks, meters, &c., is not taken into account, as it is assumed that these losses would be practically the same for either system. The C^2R losses in feeders are obtained from Tables I. and II. The transformer losses and capacity losses in connection with the H.T. scheme, are based upon recent tests. The above losses for the district and output referred to may be summarised as follows:—

	L.T. kw.	H.T. kw.
Full Load Losses.—C^2R losses in feeders	224	60
Capacity current and transformer losses	...	60
Total full load losses	224	120
⅓rd *Full Load Losses.*—C^2R losses in feeders	25	7
Capacity and transformer losses	...	38
	25	45
10th *Full Load Losses.*—C^2R losses in feeders	2	30·0
Capacity and transformer losses	—	0·6
	2	30·6
No load losses	0	30
	L.T. B.T. units	H.T. B.T. units
Daily Losses.—Full load 1 hour per day	224	120
⅓rd load 4 hours per day	100	180
10th load 1 hour per day	2	30
30th load 18 hours per day	0	540
Total daily losses	326	870

It will be seen that in spite of the very great improvements in modern transformers, the all-day losses in connection with the H.T. scheme are still very high. These may be reduced by turning off a number of the transformers during the hours of light load. But

Digitized by Google

even if they are all turned off, the losses through capacity current in the feeders will still be very high. It is suggested that, in some districts where the day load is always likely to be a very light one, and where, as at Hastings, it is chiefly confined within a radius of about 1,000 yards of the generating station, it would pay to disconnect the whole of the H.T. feeders, &c., during the hours of light load, and supply all current required through the distributing networks. If this can be done, it is estimated that the H.T. losses during the hours of light load will be reduced from 540 units per day to about 40 units per day. The relative annual losses of the respective systems would then be as follows :—

L.T. 326 units per day × 365 = 118,800
H.T. 370 units per day × 365 = 134,500

The cost of generating the above wasted units, will be as follows :—

	L.T.	H.T.
To standby charges :—		
224kw. at £5 per kilowatt	£1,120	...
120kw. at £5 per kilowatt	...	£600
To running charges :—		
118,800 units at 1½d	618	—
134,500 units at 1½d	—	700
	£1,738	£1,300

The total annual cost of upkeep will therefore be as follows :—

	L.T.	H.T.
To interest and sinking :—		
7% on £40,990	£2,866	—
7% on £25,070	—	£1,754
To repairs and attendance to feeders and other apparatus :—		
2% on £40,990	820	—
3% on £25,070	—	752
Rent of sites for sub-stations	—	30
To cost of current wasted	1,738	1,300
Balance in favour of H.T. scheme	—	1,588
	£5,424	£5,424

(*c*) *Comparative Reliability.*—Doubtless continuous-current advocates will say that, on this score at any rate, the advantages are entirely with their system. It must certainly be admitted that, in

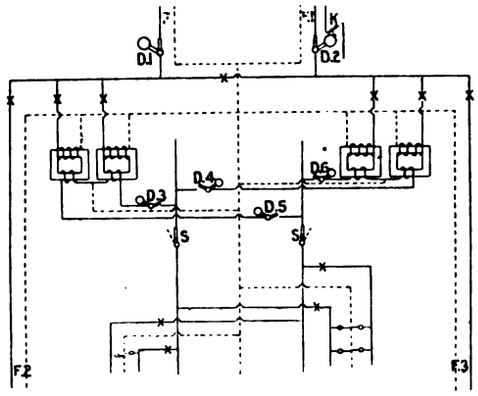

FIG. 2.

the past, low-tension schemes have not suffered from breakdowns to quite the same extent as high-tension schemes; but greater liability to breakdown does not necessarily mean a greater number of interruptions to the supply. If H.T. apparatus and feeders are efficiently duplicated throughout, a failure in any portion of the system will not cause an interruption to the supply in any district. It may very reasonably be objected that duplication costs money, but it has already been shown that an H.T. scheme duplicated throughout costs considerably less than an unduplicated L.T. scheme. It is not, however, sufficient to merely provide duplicate apparatus to be switched into use if necessary. The duplicate feeders, &c., must be connected in such a manner that in the event of a failure the faulty section will be automatically disconnected from the system, the duplicate feeder being left to maintain the supply. A satisfactory method of effecting this object is described in the author's I.E.E. Paper "The Prevention of Interruption to Electricity Supply."* Figs. 1, 2, 3, and 4, illustrate the manner in which this special system of duplication is being applied at Hastings. Fig. 1 shows the general arrangement of the H.T. circuits. Fig. 2 is a diagram of the connections, both primary and secondary, in the sub-stations. In this diagram F and F 1 represent the duplicate H.T. feeders entering the sub-station from the generating station. F 2 and F 3 are similar feeders leaving to supply other sub-stations. D 1 and D 2 are H.T. discriminating cut-outs connected to the end of each feeder to prevent a heavy current from returning *viâ* the sub-station to supply current to a faulty feeder. D 3, D 4, &c., are similar cut-outs on the secondaries of transformers. These serve to disconnect a faulty transformer from the secondary 'bus-bar, and so prevent it from short-circuiting the remaining healthy transformers. S S is a double-pole switch inserted in series with the secondary 'bus-bar. By opening this switch the secondaries of all transformers are disconnected from the distributing network. Fig. 3 shows the general arrangement of the distributing networks throughout the town. It will be seen that each distributor with its branches runs from one sub-station to another, and as all distributors are heavily fused at each end, it follows that a very heavy short-circuit on any section of the network will cut the distributor affected free from the rest of the system. The district supplied is divided into four distinct secondary networks. Each distributor is connected, either directly or *viâ* other distributors and sub-stations, to the generating station. One object of this arrangement is to enable the entire district to be supplied during the hours of light load by means of the secondary network only. Reference was made to the saving effected by this earlier in this Paper. To derive the greatest benefit from the turning off of transformers and feeders, it is necessary that this should be

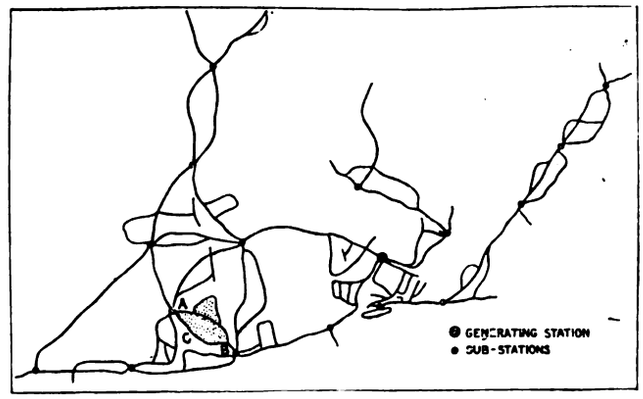

FIG. 3.

done as soon as the load falls below a certain point every night, and they should not be turned on again until the load begins to rise. The former it is comparatively easy to arrange, as turning off time will occur approximately the same time every night. But the time at which the transformers, &c., will need to be turned on, will vary from day to day, and will also depend to a great extent upon the weather; it will often, too, need to be done at a moment's notice. It is advisable therefore that the turning on should be done from the generating station. The way in which this will be affected at Hastings is shown in Fig. 4. From each sub-station a pilot wire P will be run direct to the generating station. This pilot wire will be used for the following purposes: (*a*) To indicate on a voltmeter at the generating station the pressure at the sub-station to which it is connected;

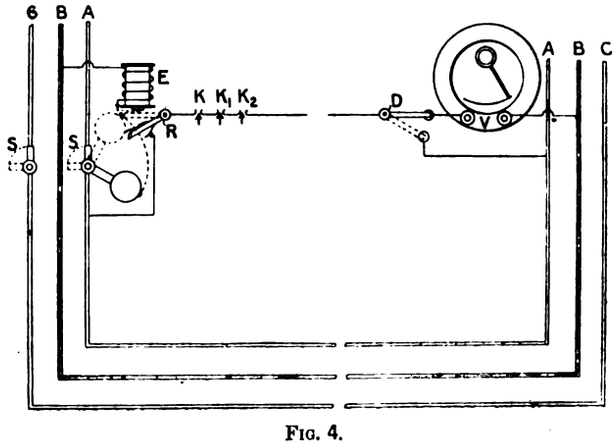

FIG. 4.

(*b*) to indicate at the generating station the position of any fault in a transformer or feeder; (*c*) to indicate at the generating station when the secondaries of the transformers have been disconnected at the respective sub-stations; (*d*) to enable the secondaries of transformers at the sub-stations to be switched on to the distributors from the generating station.

(*a*) *Pressure Indication.*—The pilot wire is connected to one of the outer wires of the three-wire system at the sub-station, and the circuit is completed through the pilot wire P, a two-way switch, D, and voltmeter, V, to the neutral or middle wire B at the generating station.

(*b*) *Fault Indication.*—A small auxiliary switch is attached to each of the discriminating cut-outs in such a manner that it is opened or

* See *The Electrician*, Vol. XLI., pp. 40 and 77.—ED. *E.*

Digitized by Google

closed by the opening or closing of the cutouts. These auxiliary switches KK 1 and K 2 are all connected in series with the pilot wire. Should, therefore, a fault occur in any H.T. feeder or in a transformer, the cutout directly connected to it will be opened thereby, and since this will open one of the auxiliary switches in series with the pilot wire, the position of the fault will be signalled to the works by the needle of the voltmeter, connected to the sub-station affected by the fault, falling to zero.

(c) *Indication of the Cutting off of Transformers.*—Between 11 p.m. and 12 p.m. it is intended to send one or two of the running staff who can conveniently be spared at this time round to the various sub-stations to switch off the transformers. This will be done by means of the double-pole switch SS Fig. 2 and Fig. 4. This switch is weighted in such a manner that it tends to stay closed. By lifting the weight the switch is opened, and it may be kept opened by means of a small catch R. The action of lifting the weight to open the switch S S lifts the catch R, and so interrupts the pilot-wire circuit, and the voltmeter needle falling to zero indicates that the transformers at the particular sub-station have been disconnected from the distributing network. When the whole of the secondaries at all the sub-stations supplied by a feeder have been disconnected, the feeder is itself disconnected at the generating station, thus cutting off all the primaries.

(d) *Switching on Transformers.*—When it is desired to switch the transformers on to the distributing network. The switch D at the generating station is placed over to make contact with the wire A. As the pilot wire at the sub-station end is connected to the neutral wire B through the catch R and coil E, a current will now pass through the coil E, and release the catch R, allowing the weight to fall and close the switch S. If the switch D is now replaced so that the pilot wire is connected to the voltmeter V, this instrument should then indicate the pressure at the transformer station. The reading of the voltmeter will be a reliable indication that the switch SS has operated satisfactorily.

THE DISTRIBUTION OF ELECTRICITY.*

BY G. WILKINSON.
(Borough Electrical Engineer, Harrogate.)

The subject of the distribution of electrical energy is such a wide one that I cannot hope to treat it exhaustively in a Paper of the required dimensions for this Association. The question of size of conductors, types of insulation, methods of laying, regulation of pressure, methods of testing and kindred subjects would each form an ample and appropriate theme for a Paper under the above general heading, but the object of this Paper is to bring before the members of this Association certain practical difficulties and suggestions upon this important branch of the electric supply business which has hitherto been somewhat neglected in favour of more interesting but possibly less important engineering and electrical details. If the responsibility of an electrical engineer ceased at the 'bus-bars in the works, his lot in life would be a happier one than it is at present; given good design of plant, sufficient boilers, engine and dynamo power, average care and intelligent supervision at the generating station, a steady electrical pressure and a constant supply of current is assured. It is undoubtedly in the distribution of the electrical energy from the generating station to the consumers' premises that the greatest risks of failure of supply occur, and it is this department of the undertaking which is fraught with most risk; here failures of a more or less serious nature are liable to occur at any moment often without the slightest warning, occurring at widely varying periods of time, usually during wet and unfavourable weather, and possibly at a time of night or early morning when it is desirable to be in bed, or at any rate free from the cares and worries of business. It is not comfortable for any engineer to feel that notwithstanding the exercise of due care and forethought, a bad fault may develop upon the mains at any moment, and effectually stop the supply of electricity to a large proportion of the consumers. Such interruptions of supply serve to destroy public confidence, cause a large amount of loss and inconvenience, and reflect more or less upon the ability of the engineer.

Against faults on mains, the possession of accumulators provides no remedy, and assuming a proper subdivision of plant with an adequate reserve of power at the generating station, accumulators are not regarded as such an important adjunct to a station as they used to be, nor are they likely to assume an important place in large undertakings until they are much improved, reduced in price, less troublesome in upkeep and of higher efficiency. It should be one of the prime motives of an engineer to make his distribution system safe and reliable under every possible condition that can arise; no spirit of parsimony on the part of those in authority should prevent him obtaining and putting down the very best cables and joint boxes money can buy. So far as experience has hitherto shown there is no difficulty in obtaining a variety of types of reliable cables; there are at least half a dozen good makers in this country, and there are as many systems of laying mains to select from, while the types and varieties of joints, joint boxes and accessories thereto in use are far too numerous. For low-tension direct-current distribution, recent practice has led to the almost universal use of three conductors laid side by side in the same trench, and they usually fall under one or other of the following types: (1) Bare conductors carried on earthenware or glass insulators within concrete, brick or iron conduits; (2) three insulated single conductors laid in troughs, and run up solid with bitumen; (3) concentric cables, armoured and laid directly in the ground; (4) single cables drawn into stoneware, concrete or bitumen conduits; (5) three-core "clover leaf" cable armoured and laid directly in the ground. No. 1 is a method of distribution which is unsurpassed for durability and simplicity, and for low-tension currents it appears to be perfectly reliable provided the conduits are kept clear of water. It can be highly commended on account of the ease and small cost of connecting consumers' installations with the mains, the service mains can be soldered to the supply mains at any point, and no joint box is required. Notwithstanding these substantial advantages this system appears to be making little if any headway owing to the difficulty of finding room for it under the street pavement, besides which, owing to the cost of the conduits and supports, it is probably not economical in first cost for conductors of less than 0·1 sq. in. section, which is too large a conductor for the less important streets.

I believe there are few engineers more favourably impressed by this system than Mr. Wordingham, but according to the returns published in his Paper on "The Distribution of Electrical Energy" read before the Northern Society of Electrical Engineers he has less than 6½ miles of this class of mains laid down in Manchester out of a total length of nearly 32 miles of distributing mains. The St. James' and Pall Mall Co. at the commencement of their works used bare conductors laid in iron conduits very largely indeed, but there have been no extensions thereto during the last seven years, bare conductors having been discarded in favour of armoured insulated cables laid directly in the ground. Method No. 2 appears to be the most widely used system for the distribution of low-tension direct current, and possesses the important quality of durability with facility and cheapness of jointing service cables. No mechanical joint boxes for service mains are necessary, the service cables can be soldered directly to the distributors at any point, the joints being insulated and the trough refilled with the waterproof bitumen. The troughs should in every case be covered with cast-iron covers to afford protection at the top and sides against mechanical injury, and the services used in connection with this system should also be enclosed in troughs and run up solid with bitumen, the whole being protected by metal covers. Experience in many towns appears to show that a carefully laid network upon the solid system is remarkably free from faults. Methods Nos. 3 and 5 have been largely used, but they do not appear to possess the qualities of durability and permanence equal to methods Nos. 1 and 2, as the steel sheathing is liable to rapid corrosion in wet ground, but given freedom from mechanical injury the life of these cables is probably measured by the life of the lead covering in which they are enclosed: what length of time this represents there is as yet no experience to show. The recent practice of putting lead sheathing cables into earthenware ducts, and covering them with a continuous coating of bitumen, will doubtless increase the durability and life of the cables.

Method No. 4 the writer regards as only suitable for feeders from the station to the various distributing centres. A good method is to draw feeders into some form of conduits, from which they can readily be withdrawn in case of a fault or for the substitution of a larger main to meet an increasing demand. The feeders should be laid in the longest lengths possible, so as to reduce the number of joints to a minimum. These joints in all cases should be readily accessible for examination, testing or repairs. For alternating currents armoured concentric cables are most frequently used as low-tension distributing mains, and give the most satisfactory results. Clover leaf three-core and triple concentric cables, armoured and laid directly in the ground, are also largely used. The three-core cable is somewhat more expensive in first cost than the triple cable, probably because it is not manufactured in such large quantities; it has, however, the advantage that the service joint boxes and connections are much cheaper. A service joint box for a triple main costs from £2 to £3. 5s., as against half the cost for a service joint-box and connections for three-core cable of the same size; in addition to this, the triple concentric box costs more in labour to joint. This means an average saving with three-core distributors of over 25s. for each service connected, or where two services are taken from the same box 12s. 6d. per service, which is a very substantial saving, especially in the total cost of connecting up small consumers. With triple concentric distributors, it is necessary at every other service connection to cut through the outer and middle conductors to make joints on the inner and outer conductors, the alternate joints being made to the outer and middle, leaving the inner conductor intact; in many triple service joint boxes, it is necessary to cut all three

* Paper read before the Municipal Electrical Association, at Leeds, June 23.

Digitized by Google

conductors at every joint, and this constant cutting and the frequent insertion of mechanical junctions, doubtless tends to impair the conductivity of the main. In some towns to avoid cutting the middle conductor the triple concentric distributors have been divided up into sections, each section being connected by a junction box, which changes the polarity of the inner and middle conductors, so that the middle will be + on one section and − in the next; all joints are made upon the middle and outer conductors only while the balance of load is thus kept approximately equal on the two sides of the neutral or outer conductor.

Probably the advent of higher voltage lamps and the consequent raising of the electrical pressure upon the distributors will lead to simple concentric mains entirely superseding both the three-core and triple mains for alternating-current distribution purposes. For high-tension distribution, concentric mains have demonstrated their superiority over side-by-side cables, both in point of efficiency and safety. For high-tension currents it is difficult to conceive a safer method of distribution than by concentric mains with the outer conductor earthed at the station, and the writer has known numerous instances where 2,000-volt mains have been sawn asunder by careless jointers with the current on, always with disastrous result to the saw, but with no inconvenience to the jointer beyond a blinding flash when the saw has reached the inner conductor. As a dielectric for high-pressure mains, paper impregnated with oil appears to be the most satisfactory; it possesses great resistance to electrical stresses, has sufficient flexibility if the cable is carefully handled, and the conductors can be heated to a considerable temperature before any damage is done to the insulation, which is a great advantage when sweating joints, or in case of having to overload a cable for the purpose of burning out a fault. Owing to the hygroscopic nature of the dielectric it is necessary that the cable be enclosed in a continuous metallic envelope to keep out moisture, and this appears to be the one weak point in paper-insulated cables, though the writer has only had two instances during a long experience in which paper-insulated mains have failed owing to blow holes in the lead covering.

Joints and Jointing Boxes.—Probably in no branch of electricity supply undertakings is more variety of design manifested than in the matter of joint boxes. Many engineers design their own joint boxes, and will employ no other type; some of these boxes are of good and reliable design, and a fair proportion of them are faulty and unreliable. Owing to the almost numberless designs of boxes used in the country and the consequent limited demand for each pattern, the cost of joint boxes must necessarily remain high, and in the writer's opinion it is time an effort was made to secure standard types of joint boxes and connections for all classes of cables, which shall be recognised as most suitable and reliable for the particular purpose for which they are designed. Until there is more uniformity of design and standardisation in joint boxes, disconnecting boxes, house service boxes, terminal boxes, and their accessories, the cost of connecting consumers' premises to the supply must remain high, and we cannot hope to be free from interruptions of supply, which, though happily in most cases occurring only at long intervals, constitute a continual source of anxiety to the engineer, and in the past have served to confirm a general impression in the mind of the public that electricity supply is unreliable, and should not be entirely depended upon either as a source of power or illumination. In the case of low-pressure supply network employing single cables the question of joints is not serious or difficult, and probably the best form of joint is an ordinary "married" and soldered joint well lapped with insulating strip, enclosed in a substantial iron case, and run up solid with a waterproof bituminous compound, or, in the case of rubber insulated cables, covered and vulcanised. For economical reasons the joints on low-pressure mains are buried beneath the pavements, and any faults which may develop are difficult to find; for this reason at every street corner an accessible distributing box should be provided at which the network can readily be disconnected and divided up into short lengths, enabling faults to be quickly located and repaired before they became serious. The pillar distributor designed by Mr. Wordingham for Manchester is admirably adapted for this purpose. The apparatus consists of a central iron pillar within the junction box, supported upon insulators. This pillar carries an iron plate for each pole; on each plate is fixed a ring-shaped porcelain insulator, carrying a gun-metal ring having projecting studs to which the cables can be clamped by means of nuts, the ends of the cable being sweated into lugs. A large funnel is slipped on to the top of the pillar, and serves to collect any water that may drip into the junction box, and so prevent it from falling upon the connections. Owing to experience obtained with fuses on mains, which were always put in too light, there appears to be a wide and well-founded prejudice against the use of underground fuses, especially in big undertakings, where, owing to the development of a fault upon a main, such a heavy flow of current will take place through the main as to permanently damage the insulating covering thereon from excessive heat. Under such conditions the conductor of smaller section would be fused before damage were done to the insulation of the main, and at the same time the faulty circuit would be isolated from the remainder of the network and prevent failure of supply on other mains in the immediate district. This is simpler, cheaper, and more reliable than employing automatic devices to break circuit with excess of current; and such automatic devices are subject to rapid deterioration when put underground, are liable to stick at the critical moment, or to open the circuit when it is not desired or necessary.

In joint-boxes for concentric cables the prevalent method of clamping up the outer conductors upon the insulation of the inner conductors should be condemned, as no permanently good connection can be made upon a more or less soft and elastic substance forming the insulation. The unsatisfactory makeshift of slipping a split ferrule in between the outer conductors and the inner insulation should also be abandoned, as seldom is a sound metallic contact upon all and every outer strand of the outer conductor secured by this method, the outer conductors often being hard bound in one diameter and loose in the diameter at right angles; thus in course of time, when the main becomes loaded to its full working density, heating is likely to take place at these contacts, the joint becoming impaired and the resistance of the main increased. In every case the "outers" of concentric or triple concentric mains should be bent out at right angles, radiating from the centre of the cable, and be securely clamped between two discs of metal, which also form the necessary connections in the joint. By this means a good contact is maintained between each and every strand of the outer conductor. If these discs of metal are made whole the centre conductor requires to be cut in order to get the discs into position, which is not good practice, although often resorted to. To avoid this, the discs should be made in halves, the division line of the front disc being set at right angles to that of the back disc, thus securing rigidity and good conductivity when fixed. For the same reason all joint boxes for mains should be made in halves, *i.e.*, divided horizontally in the plane of the cable, otherwise the mains have to be cut to get the joint boxes on, which is a common though bad method.

The writer wishes to enter a protest against the far too lavish use of compound in joint boxes. Waterproof bituminous insulating compound is a very useful and necessary article to the jointer, but it is a mistake to run up a mechanical joint box solid with this substance; the connections within the box should be enclosed in a light internal box preferably of incombustible material to keep the compound off the connections, and the compound should be run in solid between this internal box and the outer box. The difficulties of clearing the connections of this compound when once they are run up solid in it are very great; the compound is seldom brittle enough to chip out with hammer and chisel, consequently it has generally to be melted out with a blow lamp. As everybody of any experience knows this is a very tedious process, and unless great care and judgment are exercised the insulation of the incoming cables is damaged by the heat; such work as this has generally to be done when there is a fault on the main, and it makes it impossible to effect an expeditious repair, whereas if the compound simply formed a shell round the joint between the outer joint box and a fragile inner box the joint could be quickly cleared and the connections readily exposed for the necessary examination, alteration or repairs.

The author would like to see the prevailing custom of using wood or fibre boards in joint boxes superseded by the use of earthenware or other incombustible material having satisfactory insulating qualities; combustible material in house switches, fuses and distribution boxes has long been superseded by the use of porcelain, and possibly the same improvement will take place in underground joint boxes when a serious effort at standardisation has been made. Experience has demonstrated to the writer that in many instances substantial improvements can be effected in joint boxes if the cable ends to be joined are turned into a vertical position and enter the joint-box from the bottom. This method, which was a radical departure from the prevailing practice of that day, was probably first introduced by Mr. J. S. Raworth in 1892 on the high-pressure concentric mains laid in Huddersfield; in this case the mains are brought through glands in the bottom of a circular cast-iron base, the glands being made watertight round the cables by means of wax, thence through a disc of porcelain fixed on the said iron base and carrying the connections for the "outer" conductors; the "inners" being carried up still higher in the box by their own rigidity support the "inner" connections which are fixed by suitable screwed clamps to the ends of the "inner" conductors, the said clamp connections being covered by an inverted cup insulator formed of woodite. The whole joint box is covered by a dome-shaped cast-iron cover, the lower edge of which dips into a fossit, cast round the circular iron base, where it is made air and watertight by a filling of wax. This joint box was a great advance upon many of those in use at that time for the following reasons: (1) it is easily accessible; (2) the removal of the dome-shaped cover immediately exposes all the connections for examination or manipulation; (3) the insulation of the joint is high; (4) little, if any, combustible material is used in the construction of the box; (5) the joint box is cheap and the parts interchangeable. Joint boxes of this type are used by Prof. Kennedy upon the low-pressure mains in Sunderland and Edinburgh in which the ends of the single cables are turned into a vertical position and

Digitized by Google

fitted with metal cone-shaped connectors; these connectors are screwed up to a heavy horizontal connecting bar, the whole being covered by a dome-shaped cover of porcelain. Four, five or six-way boxes are also used of similar construction. There may be other towns in which this class of joint is used, and probably its use will become more general in the near future for many classes of cable owing to the simplicity of the method and the considerable advantages obtained thereby. At all points where the Raworth high-tension joint box is used it is necessary that the cable ends be left long enough to overlap each other so as to allow enough spare cable to enter the box and reach the connecting bars, also the connections within the box are so close together that the joint is practically useless as a disconnecting box during period when the cables are carrying current. The writer is using a reliable and inexpensive high-tension box of this type with very satisfactory results. This joint box is cast "coffin-shaped," viz., long in one diameter and narrow in the other, in order that it may be placed upon any cable which is already laid; and by reason of the centres being wide apart in one diameter, any cable is long enough to reach up to the box terminals, provided the cable is cut at point mid-way between the two centres. This coffin box is supported with the outer metal pavement box just below the pavement level by means of brackets which not only carry the joint box, but also grip the outer lead covering of the cables, thus effectually earthing both the inner and outer boxes, and maintaining the cable ends in a vertical position at the proper centres and attitude for entering the taper glands in the bottom of the joint box; the joint box lid which is shrouded round the rim, is secured by means of swivelled bolts and wing nuts, and is made watertight by compressing an india-rubber ring between the lid and box rim. It will thus be evident that the joint box is in the best possible position for accessibility—it is above the plane of the conduits and cables, and forms no obstructions to the drawing in or manipulation of additional mains; also the joint is well above any lodgment or flow of water in the conduits and joint pits; this latter is a valuable feature in view of the number of faults which so frequently arise through water getting into joint boxes. The box carcase is cast so that it may be used either as a straight through, or three or four-way box as desired. The outer conductors, after the cables are brought through the bottom of the joint box, are spread out radially and clipped in between contact discs, the said discs being connected together by suitable connecting links, and upon each upper half of the contact disc bosses are cast, into which externally fluted hollow earthenware insulators are screwed; through these insulators the inner conductors with their insulating coverings are brought, and the inner conductors are attached to the metal terminal discs fixed on the top of these earthenware insulators. These "inner" terminals are made in various designs according to the particular use for which the box is required, and in due form an "inner" connecting bar is used forming a first-rate quick-break switch which may be pulled out or replaced with perfect safety at full load should such an operation be necessary. A watertight compound is used only for luting up the conical cable glands in the bottom of the box, the whole of the internal connections being thus left exposed for examination, testing or repairs. These boxes in any size up to 300kw. size (viz., 150 amperes at 2,000 volts) complete with all accessories, including outer box, fixing in the pavement, jointing up, jointer's time and all labour, cost less than £5. 5s. each, while the cost of brick pit and pavement cover alone for many types of boxes exceeds this figure. In the writer's experience previous to the introducion of this type of high-tension box the cost of brick pit, pavement frame, cover, and internal joint box for concentric cables, including labour, fixing and jointing up was never less than £7. 7s. 6d. Doubtless in the near future triple mains of the "Clover Leaf" type will be extensively used for power transmission through long distances by means of multiphase currents at extra high pressure; for these mains joint boxes of the type just described possess valuable features, as they may be depended upon to stand any practical working pressure with safety, all the internal parts can be formed entirely of incombustible and durable material, and all inflammable compound may be entirely dispensed with. Another form of joint on concentric mains which should be mentioned is the simple soldered and wrapped joint, which is protected from moisture by covering lead sleeve of larger diameter than the lead tube covering the cable, and to which it is united by plumbers' wiped joints; this form of joint when carefully made appears to be reliable, but no engineer would entertain the idea of using this class of joint exclusively on a distributing network.

A fruitful source of trouble and failure on high-tension alternating current networks laid in residential neighbourhoods arises in the connections made between the concentric mains and the terminals of the small transformers installed in the houses. Usually the concentric mains are taken into a small joint box, and united therein to "side-by-side" rubber-covered mains which in turn are taken to the primary terminals of the transformers. In cases of this kind the writer has, by means of a special cable terminal end and cover, always concentric mains directly to the terminals of the transformer without the intervention of a joint box, and in no single instance has a fault ever developed,

Below is an abstract of the discussion which followed the reading of the foregoing two Papers by Mr. L. Andrews, of Hastings, and Mr. G. Wilkinson, of Harrogate, before the Municipal Electrical Association.

Mr. J. F. C. SNELL (Sunderland) felt that Mr. Andrews' Paper was a challenge to direct-current men. He would like to place before them some figures based upon Mr. Andrews' own calculations which would show a different case for the direct-current stations. There were, however, towns where obviously nothing but alternating current would suffice. He observed in Mr. Andrews' Paper that the total plant installed in the station was 1,700kw. Instead of 17 feeders allowed for he (Mr. Snell) would say that 12 feeders would suffice for the purpose. In that case there would be very much less trench work to provide. Mr. Andrews put down a triple concentric or three-core cable for each of his feeders, but a two-wire feeder would suffice amply. The feeders would then cost £24,750 instead of £37,340. The feeder panels would be covered by £1,050 instead of £1,700, making a total cost of £25,800 for the feeder system. Turning to the high-tension scheme, he had never been able to construct a sub-station yet for £100, and he thought that the £1,700 was much under-estimated for the 17 sub-stations. Instead of there being a balance in favour of the high-tension system of £15,920 there would only be about £730. He considered also that when making comparisons the transformers should be taken as part of the feeder system, and the loss on these would be 870 units per day instead of 370 as quoted. Turning to the annual cost and upkeep the figures would now be materially altered. The repairs on feeders for direct current stations taken at 2 per cent. was much too high. His experience over 12 years proved to him that one per cent. was ample for direct current work. This would reduce the figure of £850 to £258, and the total expenses would be £3,802 instead of £5,424. He believed the two schemes would work out practically the same. His point was, that if two schemes of 1,700kw. each were compared in any particular district which was not scattered, he did not think there would be £100 difference in the two schemes.

Mr. E. W. COWAN (Salford) said there were two ways in which to reduce the day losses—one within the station and the other outside. He considered the relative advantages of continuous and alternating current in relation to any particular area was a difficult subject to discuss. He thought it was best to disconnect the high-tension feeders from the network in order to save losses. Mr. Boot had indicated the ways for doing this, and Mr. Andrews had a complete scheme. Unless they knew that the switches were absolutely to be depended upon it would never do to give them such an important function to perform as automatically connecting and disconnecting transformers. The method suggested for a member of the staff to go round and switch on and off the transformers was hopeless in practice. A sudden demand from any cause would absolutely produce disaster, as there would be no time to send a runner round to switch on the different transformers. Switching feeders on and off abruptly ought not to be done in connection with any high-tension station, especially in a station with a scattered area and long feeders of any capacity. Dr. Fleming and others have pointed out that in a 2,000-volt distribution system by abruptly opening a switch you may get 100,000 volts on your feeder, and he had experienced so much trouble from this increase of the pressure that he would not allow it to be done at any station with which he was connected. The simplest way would be to connect the switch on to a 'bus-bar and run down the machine slowly. If automatic switches could be got which were reliable that was the right thing to do.

Mr. C. H. WORDINGHAM (Manchester) said that Mr. Snell had already stated what he would have liked to have said himself upon Mr. Andrews' Paper. He would have been pleased to see some mention of the high-tension continuous current work, as he thought that would have afforded a better discussion than the other two systems of high-tension single-phase and low-tension direct current. With reference to bare copper mains he looked upon ¼ sq. in. as the lowest limit of size for running bare copper conductors; he would never think of putting in a main of this kind less than ¼ sq. in. diameter. In some of the outlying districts all the large mains were bare copper in work which he had recently done. He thought the thick pitch pine cover was the best one could have, even better than cast-iron. Mr. Wilkinson mentioned that the hydroscopic nature of the dielectric necessitated the cable being enclosed in a metallic envelope. It seems to him (Mr. Wordingham) that this metallic envelope was dangerous where trams were about.

Mr. H. FARADAY PROCTOR (Bristol) pointed out that in Bristol the cost of building sub-stations, with walls 21 in. thick, and built in the most perfect manner, did not exceed £70 each. With regard to switching off the high and low pressure from the mains the proper way was to switch off first the high-tension leaving the pressure on the cable fed from the low-pressure transformer. It seemed to him the only danger from the rise of pressure would be in the continuous current station, as there were no transformers to take the pressure off gradually.

Mr. W. A. CHAMEN (Glasgow) said that owing to extraordinary conditions existing at Glasgow they had had to give up the use of bare copper conductors altogether. In Glasgow they could not retain any right for their mains under the footpaths, and they were obliged to keep taking the mains from the footpath and putting them under the street, and he believed it was very dangerous to have electric lighting culverts under the street with bare copper mains. They started in Glasgow with two systems—one using cast-iron troughing and the other earthenware troughing—both run in with bitumen or pitch. The cast-iron seems the best; but if the lead was made alive through a fault it gradually run on the lead until it could find its way through the bitumen, and then serious trouble followed. Whenever they opened any of these troughs with lead-sheathed cable in they made a point of connecting the lead metallically with the trough. With regard to the earthenware troughing, it was impossible to make good joints between the ends of the troughs, and the result would no doubt be in time that if the lead got alive electrolysis

Digitized by Google

would occur there. The result of this was that they have decided to go back to wood troughing, and they were trying now to use cables without lead sheathing.

Mr. A. S. BARNARD (Hull) would like to draw attention to the point Mr. Wordingham had raised, *i.e.*, high-tension continuous current for a town of that size. It had one or two great advantages over alternating stations on the lines suggested by Mr. Andrews; they could cut out the whole of the high-tension mains and transformers and so save the loss through the high-tension mains. In Hull they were able to control the whole of the high-tension feeders from the generating station, which saved the expense of sending a man round to switch off the transformers, &c. They had four sub-stations with 13 large transformers in them, and they send a man round during the day to attend to the lubrication. They could at any time switch on or off the transformers as desired from the generating station.

Mr. G. M. HARRIS (Bray) differed with Mr. Wilkinson on the question of jointing; he thought of all the forms of jointing concentric cables two plates clamped together was the worst. They had had great trouble from that and he considered that the proper way was to bring the outer to one side and joint them round, using solder and putting them in a proper box. He was much interested in Mr. Chamen's remarks about troughing, but there was one form he had not mentioned which he (Mr. Harris) had tried, and that was the concrete form. He thought the proper thing to put on the top of the cables was a board.

Mr. J. E. EDGCOME (Kingston-on-Thames) said the conclusions they seemed to have come to were that the low-tension men *thought* they were right, but the high-tension men *knew* they were right. He agreed with Mr. Barnard that the high tension continuous current had its advantages, but unfortunately for that particular theory there was such a large capital expenditure involved.

Mr. R. TURNBULL (Tynemouth) thought the difficulty of regulating the pressure on mains might be got over by having transformers giving different voltages on the secondaries, some 100 and others 101, &c., according to the load which they had to carry.

Mr. H. R. BURNETT (Barrow-in-Furness) said Mr. Andrews' calculations were based upon 10 per cent. drop at full load, but he thought it would be more economical to work with 15 per cent. drop at full load. The average loss of 10 per cent. at full load would probably mean not more than 5 per cent. of the average loss throughout the 24 hours.

Mr. H. L. P. BOOT (Tunbridge Wells) stated that the cost of a distributing system on low tension was considerably more than on the high tension because it was a difficult matter to run another feeder on the low-tension system to the point where the load increased rapidly, but it was an easy matter on the high-tension system to add another transformer. He did not favour automatic disconnection of transformers as they were liable to go wrong.

Mr. L. ANDREWS (Hastings) replying to Mr. Snell, said he mentioned 17 feeders because this made an average length of 900 yards to 1,000 yards, and it seemed to him that if only 12 were used they would have very poor lights at certain points. He thought it was necessary to have boosters or resistances to equalise the pressure, otherwise in some parts the voltage would vary considerably. He knew continuous-current men liked to talk about the simplicity of their system, but he preferred a high-tension alternating-current transformer to the running machinery necessary with continuous current. He mentioned £100 as the cost of a sub-station, as he wished to be on the top side; as a matter of fact, he had constructed many, with glazed bricks inside, at a cost of £80 each.

Mr. G. WILKINSON (Harrogate), in replying, said most people considered they were entitled to have the light whether they were in the outer districts or in the centre of the town. The outer districts could not be supplied on a low-tension network as these mains could not be run to all the outer districts; the capital outlay would be too heavy to make the undertaking a success. He was glad to see Mr. Wordingham agreed with him that bare copper conductors should not be used for sizes less than 250 amperes.

THE PROTECTION OF TELEGRAPH AND TELEPHONE WIRES IN CONNECTION WITH OVERHEAD TRACTION.*

BY R. C. QUIN.

(Borough Electrical and Tramway Engineer, Blackpool.)

This question at the present time is of special importance in view of the number of traction systems now being installed throughout the Kingdom, and in view also of the fact that there is such a divergence of opinion and practice. This latter is most marked in connection with the two Government Departments concerned, the Board of Trade and the Post Office. That overhead telegraph and telephone wires need protection will be admitted, but how shall this protection be best given? To the author the best method appears, and he thinks his readers will agree with him, to be the placing of these telegraph and telephone wires underground where they cross the line of tramway route. He believes the Telephone Company are not averse to this course being adopted; but we are met with the absolute refusal of the Post Office to consider any such proposition. Under these circumstances we must recognise the existence of crossing overhead wires.

The most usual practice until a comparatively recent date was to place guard wires above the overhead trolley line at a distance of about 18in., these wires being of galvanised steel and supported by insulators. There is a question which the author has often asked, and to which he has not, as yet, received a satisfactory reply, and therefore he takes the liberty of placing the question before his readers. It is this: "What are the insulators intended for?" Are they to protect the telegraph or telephone wires or the trolley line? Assuming that we adopt guard wires, they should be supported on poles 2ft. above the trolley line, but they should not be insulated. If a telegraph or telephone wire break what need is there to insulate from earth? If two guard wires in the same horizontal plane and 18in. apart be placed over the trolley line, the probability is that the broken telegraph or telephone wire would not come in contact with the trolley line or passing trolley; but it might do so. In that event it is better that the guard wire should be efficiently connected to earth, as a short circuit would be the result, and if both lines, telegraph and telephone, and trolley line be properly protected by maximum current apparatus no damage would ensue. The author would, however, point out that it is not sufficient to have these guard wires clamped to a traction post, when the traction post is bedded in concrete. There should in all cases of guard wires be two poles bonded to the rails, and these poles should preferably be the end ones of the guard wire section. The telephone and telegraph wires should be provided with fusible cutouts or other similar device for the protection of the terminal instruments, and this is a matter of no great cost. With these precautions there need be no fear of electrical accidents from overhead telegraph and telephone wires.

There is another system of protection now largely adopted, and which consists of fastening to the trolley line brass clips, and placing vertically over the trolley line a wooden moulding of greater width than the trolley wire. This system, to the author, appears to have several objections. It is more unsightly than the guard wires, and brings the trolley line into greater prominence. There also appears to be difficulty in thoroughly securing these strips, for in most towns in which they are in use many lengths have become detached. Further they do not afford the same protection as guard wires. A telephone wire may break and fall on the strip, but so far no great damage results. A car, however, comes along, and as has happened the driver does not notice the fallen wire, but the cheeks of his trolley wheel touch the wire forming contact between it and the trolley line. We then have a live telephone wire earthed only through its terminal instruments, and a live dangling wire on the car, which is not assuring to the passengers.

There is a third method which is advocated by the Post Office, and that is a system of bunching telegraph wires so as to reduce the number of crossing places, and then forming an insulated cradle or hammock round these wires. The principal objection to this course would be extreme unsightliness. It moreover by no means follows that if a wire breaks it will not fall through the cradle, as the meshes are 2ft. to 3ft. square.

If we are to regard as impossible the laying underground at crossing places of telegraph and telephone wires, then the author suggests the following as the best method to protect telegraph and telephone wires. (1) The erection of two guard wires 18in. apart, at a minimum height of 2ft. above the trolley line. (2) The length of the guard wires to be such that should the crossing telegraph or telephone wire break close up to one span insulator, and be blown horizontally in either direction it could not, when falling, come in contact with an unguarded portion of the line. (3) Each span of guard wires should be separate and distinct from its neighbour, but metallically looped across. (4) No insulators whatever should be used, but guard wire standards be bolted direct to the bracket arms, or to the span wire, as the case may be. (5) The terminal posts of each length of guard wire should be bonded to the tram rails. (6) The trolley line should be divided into sections, and each protected by a maximum current device. These sections should preferably not be of equal length, but proportioned for equal maximum working current. (7) The crossing span of telegraph or telephone wires should be terminated by a disconnecting insulating shackle on each side and the connection across these shackles should be by fusible metal bridge. If these suggestions be carried out, the author considers that all that is humanly possible to protect overhead telegraph and telephone wires will have been done.

The following is an abstract of the brief discussion on the above Paper:—

Mr. A. S. BARNARD (Hull) agreed with Mr. Quin's views upon this subject. There were many different kinds of overhead wires, and they were bound to have some means of keeping them off the overhead trolley wire. He thought the minimum height of 2ft. above the trolley wire was too much, as there was great risk of the loose end swinging round and coming in contact with the trolley. In Hull they had only a difference of 8in. rise above the trolley wire, and since they had exercised great care in drawing the trolley wire tight they had no trouble with these. He said it was very difficult to estimate where the maximum load would be required in the level districts.

Mr. A. E. LE ROSSIGNOL (Newcastle-upon-Tyne) did not agree with all the points mentioned by Mr. Quin. He thought the guard wires should

* Paper read before the Municipal Electrical Association, at Leeds, June 23rd.

Digitized by Google

not be earthed, as they would then be very dangerous to men who had to work on the trolley wires. He suggested that the guard wires should be insulated from earth, or a switch should be put in the pillars, so that the earth connection might be cut at any time to prevent men from experiencing a shock if they happened to put their heads against the wires when repairing the trolley wire. The trolley wires should be protected by a maximum current device, and he thought this device should be in the station. With regard to telephone wires, one of the worst troubles arises when one wire has dropped and the guard wires are earthed. It fuses away as it touches the trolley, and the cutout falls out at the works. On the Continent they put up in front of the insulator, carrying a telephone or telegraph wire across a track, a metal stirrup solidly connected to earth, so that when the wire breaks it touches this before it can reach the trolley. He thought the best method was to earth the whole of the guard wires through a switch, and be able to pull that out at any time.

Bailie WILLOCK (Glasgow) said "Prevention was better than cure," and he thought the best way was to put the wires under the streets. The grand secret was to get the telephones into the hands of the municipalities and have the wires put underground. They would then have a good telephone service without these risks.

Mr. R. C. QUIN (Blackpool), in reply, said that when he fixed the minimum distance of 2ft. between the guard wire and the trolley wire he had in his mind the swaying of the trolley line and the jumping of the trolley pole; his experience showed that 2ft. was the limit. The length of a section depended upon the density and the gradients. As regards the maximum current device, there was a great advantage in placing these in the section box. The disadvantage referred to by the telephone wires falling and fusing while replacing the cutouts at the station would be obviated by the section cutout. With regard to having a switch connected with the guard wire, he thought this would be very convenient, but as a general rule, when repairs were going on, the current was not on the trolley wires.

CORRESPONDENCE.

THE SOUTHPORT TRAMWAYS.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: We regret to have to call your attention to a statement appearing in your article on the Southport Traction system in your issue of August 3rd, in which you state the overhead construction was erected by us, and remark as follows: "Some details in the attachment of the guard wires and anchor wires are open to criticism, as, for instance, making-off the anchor wires on the trolley wire ears and the omission to secure the guard wires (which are also noticeably kinked in places) to the hooks. *The latter is a serious defect, for in the case of a guard wire breaking several hundred yards might come down.*"

While all work is open to fair criticism, to which we cannot object, yet we most strongly object to the last sentence in the above paragraph, and demand that you recall it. In the first place, there are hardly any sections of guard wire in Southport that exceed 200 yards in length; in the second place, your statement is incorrect, as the guard wire is properly secured and tied in to each support, and cannot come down in the manner you state.—Yours, &c.,

MACARTNEY, MCELROY & CO. (LTD.)
J. F. Macartney, Managing Director.

London, August 3, 1900.

[We regret that the word "properly" was omitted in the first sentence quoted above, before the bracket. On the opening day, July 18th, the guard wires were certainly not secured in a workmanlike manner. It is interesting to know that in hardly any case could *more* than 200 yards of guard wire have come down.—ED. *E.*]

THE ENCLOSED ARC LAMP PATENTS.

TO THE EDITOR OF THE ELECTRICIAN.

SIR: In reference to the note appearing in your recent issue *re* the discontinuance of our action against William Jones Davy, we must ask you, in justice to The Jandus Arc Lamp and Electric Co., Limited, and to our many licensees, to state that proceedings in the nature of a test action upon the Jandus patents are now pending in which we are advised that (as in the recent Johnson and Phillips action) we shall have a successful issue. We shall then deal with the small infringers as we did with those licensees who, to their own detriment, elected to join hands with Messrs. Johnson and Phillips in disputing our rights under our licenses.—Yours, &c.

For the Jandus Arc Lamp and Electric Co., Ltd.,
London, August 8, 1900. A. A. GILLIES, Secretary.

LEGAL INTELLIGENCE.

Postmaster-General v. Loch.

In the Edinburgh Small Debt Court recently, the Postmaster-General sued Mr. Adam Loch, a contractor, for the recovery of £9. 8s. 1d., damage alleged to have been caused to a telegraph line underneath a public thoroughfare in Leith. It was alleged that the telegraph line was melted by the heat from a tar boiler which defender employed for his business For the defence it was urged that as the defender did not know the telegraph line was there he should not be held liable. Eventually Sheriff Reid gave judgment for the amount claimed.

Charing Cross and Strand Electricity Co. v. Johnson and another.

This case was in Mr. Justice Cozens-Hardy's list yesterday (Thursday), but before the case was called on Mr. Eve, Q.C., stated that it was a right-of-way-case, but he could not ask his lordship to try it on motion. No undertaking would be given, and the motion by consent would stand until the trial of the action.

Burke v. British Blahnik Arc Light Syndicate.

In the Chancery Division on Tuesday, Mr. Justice Kekewich heard an adjourned motion for the appointment of a receiver. It was now explained that the consent of a trustee for the debenture-holders was not obtainable owing to his being away from town. His Lordship made the declaration asked for.

Re London Electrical Cab Co. (Ltd.).

The petition by C. E. Foster and others for the winding-up of this company has been, by consent, ordered to stand over until after the long vacation.

PARLIAMENTARY INTELLIGENCE.

NATIONAL TELEPHONE CO. AND GLASGOW CORPORATION.

In the House of Commons on Monday Mr. Provand asked the Secretary to the Treasury whether the National Telephone Co. had intimated to the Postmaster-General that they agreed in terms of sec. 3 of the Telegraphs Act, 1899, to it being made a condition of their licence that they would not give preference to any person within the area specified in the licence granted by the Postmaster-General to the Corporation of Glasgow, and would not within that area, as a condition of giving a service, require any person to grant any facility except for the purpose of supplying telephonic communication to that person; whether the company had claimed, in respect of coming under this condition, that the permissive powers to open streets in certain burghs within that area now hold good for the whole term of their licence, and, further, that their licence be extended from 1911 to 1913, so as to terminate at the same time as the licence to the Corporation of Glasgow; whether the company had issued a print of an agreement with subscribers in the Glasgow area, dated June 18, 1900, under which the intending subscriber must bind himself as a condition of receiving a connection from the company not to subscribe to any exchange telephone system other than that of the company, or use at any of his premises any telephone instruments in connection with any such other system, and the company thus proposed to give favour of preference to persons in the Glasgow district who did not join the Corporation telephone exchange as against those persons who joined that exchange; and what steps the Postmaster-General was prepared to take to secure that the company should not obtain privileges under last year's Telegraphs Act and at the same time refuse its obligations.

Mr. HANBURY said the National Telephone Co. had stated to the Postmaster-General that they were willing that the conditions mentioned in the question should be made a condition of their licence. They had also undertaken to prove to the satisfaction of the Postmaster-General that they had incurred or contracted to incur material expenditure in laying underground wires in certain burghs in the Glasgow area, and had acquired powers for the purpose under agreements with the local authorities. The Postmaster-General was not aware that the company had at present claimed that the powers given by their agreements with local authorities in the Glasgow area would hold good during the period of the licence granted to the Corporation of Glasgow, and that their licence would be extended for the full period of the Corporation licence; but when the conditions to be observed on the part of the company had been duly complied with they would no doubt claim that they were entitled to the advantages specified in sec. 3 of the Telegraph Act, 1899. The Postmaster-General's attention had been drawn to the form of agreement offered by the company to their subscribers, and there was some doubt whether the condition mentioned could be held to be a breach of the undertaking not to give preference to persons in the Glasgow area; but there was another condition in the agreement—that as to granting wayleaves for the lines of other persons—which would unquestionably be a violation of the undertaking not to require any person to grant any facility except for the purpose of supplying telephonic communication to that person. Any breach of the new conditions which the company were to accept as conditions of their licence would, when those conditions were legally in force, render the company liable to the same penalty as a breach of the original conditions, and that penalty was the termination of their licence.

Digitized by Google

LOCAL AUTHORITIES AND TRAMWAYS CONSTRUCTION.

In the House of Lords on Thursday last Lord RIBBLESDALE asked the Chairman of Committees whether he had considered the expediency of proposing an alteration of Standing Order No. 22, the effect of which was to give local authorities a veto upon any proposal for the construction of a new tramway. In the event of the London County Council promoting a tramway bill they had to obtain the consent of the local authorities and accept such conditions as the local authorities desired to impose, not always in the public interest.

In reply, the EARL OF MORLEY said he hoped next session to propose an amendment of the standing order.

MUNICIPAL TRADING.

A report was issued on Saturday by the Joint Select Committee of the House of Lords and the House of Commons on Municipal Trading. Owing to the Committee having been appointed at a comparatively late period in the session the report states the Committee has not been able to bring the inquiry to a satisfactory conclusion before Parliament rises. The report recommends that the Committee be re-appointed next session.

MUNICIPAL, FOREIGN & GENERAL NOTES.

Acts of Parliament.—Royal assent has been given to the following acts :—

Aberdeen Corporation Tramways.
Airdrie and Coatbridge Tramways.
Aston Manor Tramways.
Barnsley Corporation.
Blackpool, St. Anne's and Lytham Tramways.
Bradford Corp. (Tramways, &c.).
Bray and Enniskerry Railway.
Brighton Corporation.
Charing Cross & Strand Elec. Supply Corp. (Ltd.) (Further Powers).
Christchurch & Bournemouth Trams.
Cork Electric Trams. (Extension).
County of Durham Electric Power Supply.
Devonport Corporation.
Edinburgh Corporation.
Electric Lighting Orders, Nos. 6, 7, 8, 9, 10, and 12.
Great Grimsby Street Tramways.
Hamilton, Motherwell and Wishaw Tramways.
Hastings Tramways.
Huddersfield Corporation Tramways
Ipswich Corporation Tramways.
Lancashire Electric Power.
Lancaster Corporation.
Liverpool Corporation.
Liverpool Overhead Railway.
London County Tramways.
London County Tramways (Electrical Power).
London United Tramways.
Mersey Railway.
Newcastle-upon-Tyne Elec. Supply Co.
North Metrop. Elec. Power Supply.
Nottingham Corporation.
Plymouth, Stonehouse and Devonport Tramways.
Preston Corporation.
Rawmarsh Urban District Council Tramways.
Reading Corporation Tramways.
Rochdale Corporation.
South-Eastern Metropolitan Trams.
South Lancashire Tramways.
South Staffordshire Tramways.
South Wales Electrical Power Distribution Co.
Southport and Lytham Tramroad
Vale of Rheidol Light Railway.
Walker and Wallsend Union Gas Co. (Electricity Capital).
Wellingborough & Dist. Tramroads.
Whitechapel and Bow Railway.

Aldershot.—Edmundson's Electricity Corporation have written to the District Council suggesting that as the Council possess a provisional order they should arrange the necessary loan for erecting electricity supply works, and they would undertake to carry out the whole of the works required under the Council's supervision and at prices to be arranged. The company would undertake to manage the works when erected for seven years, taking all profit or loss which might be made, and guaranteeing to the Council the payment of interest and sinking fund due upon their loan. The Council would also have the option of taking over the works at seven years, on paying the company a premium of 15 per cent. upon the capital expended, or at 14 years on payment of 10 per cent. on the capital expenditure. The offer has been referred to the Electricity Lighting committee.

Barnstaple.—It has been decided to engage an electrical engineer to advise on the best means of carrying out the terms of the Council's provisional order.

Belfast.—The Electric committee have included in their report to June 30 the following resolution :—

That a record be made of the committee's appreciation of the able and courteous manner in which Mr. V. A. H. M'Cowen has discharged his duties as chief engineer, which included the designing and establishment of the present electricity works, rendered necessary by the rapid development of the undertaking under his charge.

Bradford Corporation Tramway Contracts.—Messrs. R. W. Blackwell & Co., who carried out the electrical equipment of the Bradford Corporation tramways to Great Horton and Eccleshill, recently addressed a complaint to the Bradford Corporation alleging that, in connection with the tramway extensions now in hand (for which their tender was £13,540), the successful tenderers, Messrs. Macartney, McElroy & Co. (whose tender was £12,064), had been allowed detailed deviations from the specifications, which amount to a saving of £851. This communication was considered at a meeting of the Tramways sub-committee on Wednesday, when a letter on the subject from Messrs. Macartney, McElroy & Co. was read. No resolution was passed, but a report will be submitted to the Tramways committee in due course.

Braintree (Essex).—The Council will oppose the proposed application of the North British Electricity Supply Co. for a provisional order.

Burton-on-Trent.—The surveyor (Mr. Lynham) has submitted a report on the proposal to construct tramways in the district, but before proceeding further the Council have decided to obtain a report from Prof. Kennedy on the matter.

Cardiff.—At the meeting of the Lighting and Electrical committee last Thursday it was announced that the borough electrical engineer (Mr. N. Appelbee) and four members of his staff had sent in applications for increased salaries. At the meeting the chairman (Mr. Hallett) presided. The following is an abstract report of the proceedings culled from the *Western Daily Mail* of the 3rd and 4th inst. :—

Mr. APPELBEE said it might be interesting to know that five of the staff were seeking employment elsewhere.

Mr. GOOD : I am very glad to hear it.

Mr. FOX : When we advertise we have plenty of applicants.

The CHAIRMAN : We shall not be able to do anything with the electric light until we have swept the whole lot out. After what has happened and what Mr. Appelbee has said this is proved conclusively. All they want is to get as much money as they can out of the ratepayers and to do as little as possible.

Mr. MORGAN THOMAS : Everyone is playing off his own bat.

The applications were deferred.

A letter was read from Mr. W. H. Illingworth resigning the post of superintendent of mains, to which he was appointed in June.

Mr. FOX thought before they accepted the resignation they should hear what Mr. Illingworth had to say. It was a most extraordinary thing, and he moved that they decline to accept the resignation until Mr. Illingworth appeared before them.

The CHAIRMAN : You must be careful. Suppose he won't come here ?

Mr. APPELBEE said he was not surprised at the resignation. He did not think Mr. Illingworth had been comfortable at Cardiff, and he had received two offers from elsewhere.

Mr. M. THOMAS said he had heard that the men under Mr. Illingworth were not capable, in his opinion, to carry out the work successfully, and that he had complained repeatedly.

Mr. APPELBEE said he had the highest opinion of Mr. Illingworth's qualifications, and should be sorry to lose him.

The next day Mr. Illingworth appeared before the Committee :—

The CHAIRMAN said they received his resignation with regret, and felt there was something behind it all.

Mr. ILLINGWORTH said, personally, he would have preferred to have his resignation accepted without going into details as to the reason why he had taken the step. He assumed that the committee held him responsible for the efficient distribution of electrical energy in Cardiff. He had heard of their failures in the past, and, as mains superintendent, he feared his reputation might suffer if such failures again occurred. They must look forward to a much larger demand for energy, and he had found on examination that to prevent failures during the approaching winter it would be necessary to make many alterations to the distributing stations, to the tanks and mains, and to the low-tension network. The stations were not in a good condition as to equipment an cleanliness. In many instances the transforming cases were not properly earthed. He had reported matters on a good many occasions to the deputy-engineer (Mr. Teasdel). So far, however, he could not see any great improvement. Having regard to the approach of winter, he felt that, unless something were done, he could not be responsible for the proper and efficient supply and distribution. He had also had some trouble, which he looked for, from the mains. He heard that the department had not been properly handled—he did not know through whose fault—and he found that the men had got into dilatory ways, and were not at all sharp and attentive in the discharge of their duties, though of late an improvement in that respect had been noticeable. He had been superintendent of mains in Salford and Halifax, and had many years' experience in carrying out schemes and estimates. It was necessary to get out of the men's heads the idea that because they worked for a corporation they could do a different day's work than for a private firm, a feeling which certainly had existed, although it was wearing away now, and would probably disappear in time. One matter that had caused friction was the fact that the public works department did a good portion of the work, such as excavating, laying conduits, &c., whilst previously it had always been his custom to take a job in hand and carry it through. These and other matters troubled him, and led him to fear that, unless thing were different, he might later on find himself in an awkward position. Probably they would have breakdowns and then they would be justified in saying he was not fit for the position, and that would be a stain upon his reputation. Regarding these and other personal matters he did not know that he had complained directly to Mr. Appelbee, it being his intention not to trouble him at all. However, he did communicate with Mr. Appelbee before writing his resignation, and he had also stated in his book that he had had trouble with the men. He did not say the men were not efficient, for if they liked they could be efficient. He had conveyed in writing to Mr. Appelbee a great many things he considered it necessary to do. When he came to Cardiff he was handed a list of consumers' premises which he was told had been examined and the work completed, but on inspection he found nothing had been done, and so he had to start to do all the work over again. He was told the free library had been completed, but he had had four or five men employed there every week. He did not complain so

Digitized by Google

much of the mains as of the distribution centres, the tanks, and the low-tension network. Undoubtedly, it would be better if he could be in direct communication with Mr. Appelbee.

Mr. APPLEBEE said he took the whole responsibility for the outdoor department—the responsibility which he had from them, and which he accepted. He had received no complaints from Mr. Illingworth, and the first time he heard of any friction was two days before Mr. Illingworth's resignation was received. Mr. Teasdel had not said a word to him. He reminded the committee that it was they who instructed him to make Mr. Teasdel his deputy. He did not make the appointment, and he did not think that Mr. Teasdel was a fit man to be deputy, having regard to his training and qualifications. Moreover, the friction was not limited to Mr. Illingworth.

Mr. GOOD: Why do you allow your deputy to give instructions?

Mr. APPLEBEE: I have carried out your instructions.

Mr. FOX urged that a vast improvement would be affected if Mr. Illingworth were made solely responsible to Mr. Appelbee and the committee.

Mr. M. THOMAS favoured a thorough reorganisation of the department, Mr. Illingworth to be asked to withdraw his notice pending the inquiry.

Mr. ILLINGWORTH, in deference to the committee, consented.

The CHAIRMAN said things were going from bad to worse. If anything happened the committee would be blamed. If anything went wrong, Mr. Appelbee got behind the powers given him, or else he put the blame on somebody else's shoulders. It was Mr. Appelbee's duty to see that Mr. Illingworth did his work, instead of sending for his deputy, and things ought to go on smoothly, as in any large engineering department. They had had nothing but trouble since this department came into existence, and the time had come to ask Mr. Appelbee to resign. That was his view, and he could not express it too strongly.

On the motion of Mr. M. THOMAS, the inquiry was adjourned, Messrs. Appelbee, Teasdel and Illingworth to attend.

Carmarthen.—Owing to a disagreement with the gas company as to quality and price of gas, the Council have decided to engage an electrical expert to report on the question of establishing electricity supply.

Chile.—During 1899 negotiations were in progress for the establishment of electric tramways in Valparaiso, but owing to the opposition of the existing horse tramway company, the project fell through. The owners of these latter lines have a clause in their concession that their tramways shall not at any point be crossed by those of another company, nor shall any new company lay down parallel lines. Considerable extensions to the tramways are being made.

The town of Caleta Buena is supplied with electric light by the Agua Santa Co., whose works also supply the water and ice upon which the town depends.

At Santiago the Chilian Electric Traction and Light Syndicate (Ltd.), with over £1,000,000 subscribed capital (British and German), is making good progress. It has been decided to obtain water power of about 50,000 H.P. from the river Maipu to generate current for the electric lighting of Santiago and a complete service of electric tramways.

Colchester.—The Council have agreed to enter into a seven years agreement for supplying electric current for lighting the Military Hospital, the Goojerat Barracks, the double canteen and married men's quarters, the officers' mess, and recreation rooms of the Sobraon Barracks at the following charges: For the first 50,000 units per annum 4½d. per unit, and for any quantity above this figure 4d. A new main is to be laid over the Abbey Field in the position approved by the War Department at an estimated cost of £1,500.

Consett.—Though the District Council have accepted the tender of the Shotley Bridge and Consett District Gas Co. for lighting the district during the coming session, particulars of the cost of electric lighting are to be obtained.

Dublin.—The Corporation has decided to send a deputation consisting of Councillors Jones and M'Call, the city surveyor (Mr. Spencer Harty), and the electrical engineer (Mr. Mark Ruddle), to inspect and report upon the systems of electric lighting in the leading Continental cities. The deputation will be accompanied by the consulting engineer (Mr. Robert Hammond).

"Duncan's Manual of Tramways, Omnibuses and Electric Railways."—The 23rd edition of this useful manual has just been published and contains a mass of interesting statistics regarding tramways in Great Britain, and also foreign companies originally promoted and controlled in this country. The information includes an analysis of the last published accounts, the directors and chief officials of the companies, and so far as we have been able to test it the information is accurate and up to date. At the end of the book is an alphabetical list of officials, engineers, and others connected with tramway undertakings. The published price is 3s. 6d., and copies of the book can be obtained from Messrs. T. J. Whiting & Sons (Ltd.), 7A, South-place, London, E.C.

Electricity in Mining.—An important announcement as to the electrical transmission of power from the Cauvery Falls, Mysore (India), to the Kolar Field was made last week by the chairman (Lord Ribblesdale) of the Road Block Gold Mining Co. He said that an arrangement had been made with the Mysore Government for the transmission of electric power from the Cauvery Falls to the Kolar Field, which would tend to very much decrease the working expenses of the mines. It will probably take about two years to complete the scheme. The Falls are about 100 miles from the mines. At first about 4,000 H.P. will be available.

Electrical Imports into Argentina.—A recent issue of the *Review of the River Plate* gives the following figures in regard to the import of electrical appliances during the past year:—

	Quantity.	Value.
Galvanised iron wire	26,240 tons	£338,455
Dynamos	658	20,228
Electrical apparatus	6,211 cases	68,207
Wire and cables	1,257 tons	102,341
Fittings, chandeliers, &c.	98 tons	28,671
Phonographs and gramophones	2,752	4,408
Arc-light carbons	139 tons	4,164
Incandescent lamps	33,704 doz.	20,222
Telephone material	416 cases	4,023
Telegraph do.	1,011 cases	7,398

Electric Cargo Cranes.—The Tees Union Shipping Co. have recently erected at their wharf at Middlesbrough three portable electric cargo discharging cranes similar to those which have proved so successful at Southampton (see *The Electrician* for 18 Nov., 1898) The cranes, which are capable of lifting 5 tons, have been constructed by Messrs. Stothert and Pitt, the consulting electrical engineer being Mr. J. G. W. Aldridge, who was responsible for the Southampton installation. The cranes erected for the Tees Company have already given great satisfaction.

Enfield.—Three companies have given notice of intention to apply for provisional orders, but the District Council have decided to co-operate with the Councils of Tottenham, Edmonton, Wood Green, Southgate, Enfield, Finchley, and Friern Barnet in the promotion of a bill for electric lighting powers. Pending the execution of the proposed agreement between these local authorities information is being collected concerning the proposals of the three companies whose proposals are before the Enfield Council.

Exhibition.—The first Ironmongery and Hardware Trades Exhibition will be held at the Agricultural Hall, Islington, London, N., between the 15th and 25th inst.

Fakenham.—Owing to the local gas company having increased the cost of public lighting from £210 to £275 the question of adopting electric lighting is being debated in local circles. The Council have consulted Mr. Mann, electrical engineer, of Norwich, who estimated the cost of purchasing and erecting the lamps, lamp-posts and fittings, cables, &c., at £850, and Messrs Miller, Son & Co. undertake to give a supply of current at £187. 10s. per annum. The subject was discussed at a public meeting last week, and though the prevailing feeling was in favour of electric lighting, a committee of 10 were appointed to deal fully with the matter.

Fire Risk Rules.—The Northern Assurance Co. has just issued a new set of rules for governing electrical installation risks.

Frankfort-on-Main.—This city has taken over the management of its tramways, and has introduced electric traction. As soon as the new organisation is complete the mails will be carried to and from the great central railway station by specially constructed electric cars. This experiment of the Imperial German Post Office in the carriage of mails by electricity is the first of its kind in Germany.

Gloucester.—The Electric Light committee has been instructed to ascertain the cost and report upon the advisability of lighting the whole of the public thoroughfares by arc lamps.

Hammersmith (London).—The plans of the project for obtaining water from the Thames for condensing purposes for the Hammersmith electricity supply station have been approved, and tenders for the work, which is estimated to cost £6,350, are being prepared.

Hawaii.—The Marconi system of wireless telegraphy is being established on the Hawaiian islands with a view of providing prompt communication between the islands for the benefit of planters, merchants, &c.

Hull.—Some time ago the Corporation accepted the tender of Earle's Shipbuilding and Engineering Co. for the supply of two dynamos, but subsequently that firm went into liquidation. Last week the Electric Lighting committee reported that they had received a communication from the legal advisers of the Vulcan Boiler and Insurance Co., who were sureties for the contractors, and it was recommended that the Corporation should agree to Messrs. Thomas Parker supplying the dynamos, but without a spare armature, the Corporation paying £3,725 (the same amount as would be payable under Earle's contract), and the insurance company paying the difference between that sum and the price charged by Messrs. Thomas Parker (between £400 and £500). This course was approved.

Huntingdon.—The Council have resolved to apply for electric lighting powers, and the application of the North British Electricity Supply Co. will, therefore, be opposed.

Infirmary Lighting.—The St. Pancras (London) Guardians have decided to adopt electric lighting at Cook's-terrace Infirmary.

Digitized by Google

Current is to be taken from the Vestry's mains and the wiring is to be carried out according to the specification of the chief engineer to the Vestry (Mr. Sydney W. Baynes). The question of lighting the workhouse is postponed.

Kilmarnock.—The Town Council have decided to ask the British Electric Traction Co. to send a representative to explain the company's electric tramway scheme at the next meeting of the Council.

Leicester.—The chairman of the Gas and Electric Light committee (Ald. Lennard) last week presented the report of the electricity department for the June half-year. The output was 489,055 units against 342,327 in the corresponding period last year, an increase of 42·86 per cent. The number of consumers was 827 against 565.

Light Railway.—On Wednesday Sir Courtenay Boyle heard the appeal of the Worcestershire County Council against the confirmation of the Bromsgrove Light Railway Order. The objection was not to the preamble of the order, but the County Council wanted the New-road as well as the High-street and Strand repaired by the promoters. After hearing evidence, the Board of Trade dismissed the appeal.

Long-Distance Telephony on the Continent.—Germany is connected by telephone with the following countries:—Austria-Hungary, Belgium, Denmark, the Netherlands and Switzerland. Frankfort-on-Main is connected with Basle and Brussels, the connection with Vienna not being yet completed. When telephonic communication is established between the United Kingdom and Belgium, this will give a connection between Germany and the United Kingdom, and render possible direct-speaking by telephone between Frankfort and London.

Malvern.—The desirability of erecting joint electric light and refuse destructor works is being reported upon by the town clerk.

At the meeting of the Malvern Hills Conservators, on Wednesday, it was announced that a syndicate had submitted a scheme for erecting a funicular railway from the town to the top of the Worcestershire Beacon, a height of 1,400ft. Mr. W. Davis considered an electrical funicular railway would be an attraction to the town, and he would not vote for steam. However, before deciding to support the scheme it was resolved to apply for further particulars.

Manchester.—The manager of the National Telephone Co. (Mr. W. E. L. Gaine) attended before the Telephone committee of the Corporation on Tuesday, in order to further explain the proposals of the National Company relative to the working of the telephone system in the Manchester area. The committee resolved to see representatives of the new Mutual Telephone Co., and also to obtain further information from Mr. A. R. Bennett, before coming to a decision.

Mill Lighting.—The new Leicestershire mills of Messrs. M. Wright & Sons have been equipped for electric lighting and electric driving by Messrs. Ellis & Ward, of Birmingham.

Peterborough.—A discussion took place at the last meeting of the Council on the proposal to borrow further moneys for electric lighting, but eventually an amendment was carried that before any further expenditure is incurred a full statement of expenditure to date should be published.

Press Telegrams.—A deputation from the Newspaper Society waited upon the Postmaster-General last week to urge upon the department the necessity for greater expedition in the despatch of Press telegrams. Sir J. A. Willox, M.P., pointed out that the provincial Press was chiefly affected, and that during the last six years the standard of expedition in the delivery of messages had gradually declined, especially in the provinces. In reply, the Postmaster-General promised to consider carefully the points submitted:—

It had been stated, he went on to say, that when the telegraphs were taken over by the State an assurance was given to the Press that the standard of efficiency and expedition of the telegraph companies should be maintained. He was not in a position to discuss that assurance, as it was given so long ago; but it had ever been the intention of his predecessors, since the change took place, to give effect to those instructions. To a great extent the promise had been fulfilled, and extra facilities afforded. But he wished to draw attention to the enormous extent to which the whole system of telegraphy had increased since 1870, and to the demands made upon the department. For the June quarter of 1900 the number of Press telegrams was 1,977,672, a 16·38 per cent. increase on the record of the similar period last year. This was the highest on record. Instructions had been given to consult the convenience of the Press, and he had no intention whatever of placing them in a secondary position. Instructions had been given to superintending officers to do their utmost to deal efficiently and promptly with news telegrams. The present had been an exceptional year. The war in South Africa had materially added to the work of the department; and about 100 of their best telegraphists were at the front. If there were delay it was to some extent to be accounted for by that fact. When the system was originated it was after consultation with the various news agencies, and the question might arise as to whether work now done by the department should not be done by the news agencies before the messages were handed in, and consequently the delay be reduced. Those in authority had been told they were not to shrink from incurring extra expense, if necessary, in having their staff fully equipped.

Projected Electric Power Scheme.—A correspondent of the *Glasgow Herald* states that Sir Wm. Preece (Messrs. Preece and Cardew) and Messrs. Strain and Robertson, civil engineers, of Glasgow, have, during the past week, been visiting various industrial centres in the West of Scotland in connection with a project for establishing on or near the coalfields stations for generating electrical energy on a large scale. The scheme, which has been under consideration for a considerable time, embraces portions of the counties of Lanarkshire, Ayrshire, Renfrewshire, Stirlingshire and Dumbartonshire. The promoters of the scheme propose to supply the electricity in bulk for power, traction and lighting purposes to local authorities and other large consumers.

Saddleworth (Yorks.).—The Council are recommended by the Lighting committee to establish electricity works for lighting the area between Delph and Junction, or Denshaw, and also to connect the two places by an electric tramway.

Salisbury (Rhodesia).—Mr. Cecil Rhodes is urging the municipal council to adopt an electric lighting project, and has offered to provide the installation if the council will agree to take it over at cost price within from three to five years.

Sheffield.—Acting upon the advice of the engineer and manager (Mr. S. E. Fedden) the Electric Light committee have decided to make no charge for service connections within 30ft. of the distributing main. At Wednesday's meeting of the Corporation Ald. Styring said that the modification would be much appreciated by would-be consumers, and it was expected that applications would be received in larger numbers than at present. He also stated that it would be in the memory of members that a week or two ago a somewhat serious breakdown occurred in connection with the lastly installed machine at the station. The breakdown was of a serious character, and it was just possible that they might be placed in some difficulty in keeping up the supply until the new alternator on order was completed.

For the six months ended June 30 the equivalent of 9,585 8 c.p. lamps was connected against 9,425 in 1899. The number of units generated was 999,377 against 745,210. The receipts for current sold (761,776 units) amounted to £12,227. 17s. 9d. against £8,743. 5s. 7d. (538,606 units) in 1899. During the half-year 37,594 yards of cast-iron piping were laid, and 20,137 yards of cable drawn in.

Shipley.—An inquiry has been held here into the application of the Council to borrow £22,000 for establishing electricity supply. The clerk (Mr. J. S. Rhodes) said there had been a general demand for electric current. Already several independent installations had been erected. From a short canvass recently made orders for the equivalent of 2,500 8 c.p. lamps, together with 49 arc lamps and 10 H.P. in motors were obtained. In 1903 the lines of the local tramways would be converted to electric traction. These tramways are a continuation of the Bradford system, but the Council insist on supplying current for operating the lines in their own district. The pumping at the sewage works is also to be effected electrically. The consulting engineer (Mr. Robert Quin) gave technical details. There was no opposition.

Smoke Nuisance.—At the Lambeth (London) police-court on Thursday the South London Electric Supply Corporation were summoned by the Lambeth Vestry for allowing black smoke to issue from their chimney shaft in such a quantity as to be a nuisance, and were fined £10 and 2s. costs.

St. Anne's-on-Sea.—The Local Government Board have sanctioned the Council's electricity supply scheme.

St. George's (London, W.).—Last week the Electric Lighting committee recommended that upon consideration of the report of Sir William Preece, and Prof. A. B. W. Kennedy's observations thereon, the Vestry adopt the first scheme of the Westminster Electric Supply Corporation for lighting the streets electrically. Some particulars of the scheme were given in *The Electrician* of June 29.

Spalding.—Though the application of the United Electric Light and Traction Co. for a provisional order is to be opposed, the Council have resolved that it is inadvisable to embark on electric lighting until the debt on the gasworks has been liquidated.

Stockton-on-Tees.—Extensions of the electric lighting mains, estimated to cost over £2,000, have been authorised. The Electric Lighting committee reported at the last meeting of the Council that they had agreed to supply the South Durham Steel and Iron Co. with electricity for motive power at their malleable works on the following terms: The company to provide and lay their own cable from the electricity station to the works, and also provide a meter at their own expense, the quantity of electricity to be supplied not to exceed a maximum of 200 H.P., and the price to be 1·2d. per unit, with a minimum payment of not less than £150 per quarter.

Sunbury.—The Twickenham and Teddington Electric Supply Co., which have already obtained a provisional order for Twickenham, wish to obtain powers for this district, and at the last meeting of the Council Mr. F. E. Gripper attended, and explained the company's proposals. Further consideration deferred.

Digitized by Google

Tariff Changes.—Electric lighting machinery for the electric lighting of Georgetown and New Amsterdam (British Guiana) are to be exempt from duty, as are telegraph instruments and materials, and electrical machinery and apparatus, overhead equipment, &c., for the proposed electric tramway in Georgetown.

Electric motors imported into Victoria are subject to a duty of 25 per cent.

Telegraph Engineers Conference.—The annual conference of the Amalgamated Association of the Postal Telegraph Engineering Department was held at Leeds on Monday. Mr. T. Landrick (Leeds) presided, and delegates were present from most of the principal telegraph centres in the kingdom. The general secretary (Mr. G. Young, Norwich) reported that the Association was in a stronger position than it had ever been, mainly due to increased membership, notwithstanding that Cardiff and Belfast had seceded from the Association. The next confereuce is to be held in Birmingham. During the year they had had the welcome addition of Edinburgh, Coventry and Holloway.

Torquay.—Sanction to the borrowing of £15,000 for electric lighting extensions has been received. The Electric Lighting committee are to report upon the question of applying for powers to construct electric tramways.

Transvaal War.—Mr. W. G. McMillan, on behalf of the Electrical section of the "Building Trades Gift to the Nation," forwards a set of 19 specifications relating to the electric light installation at the Home of Rest for Discharged Soldiers, which is being erected at Bisley on freehold land presented to the fund by Lord Pirbright. Tenders are invited to these specifications, or, as an alternative, gifts in money towards the expense of the electrical equipment of the home. Further particulars can be obtained of Mr. McMillan, at the Institution of Electrical Engineers, 28, Victoria-street, London, S.W.

Tunbridge Wells.—The Council have decided to apply for power to borrow £5,000, the estimated cost of the following works: New chimney, 180ft. high (designed by the borough surveyor); economisers, flues, feed-water piping, and contingencies, under the superintendence of the borough electrical engineer (Mr. Horace Boot).

Water Power Utilisation in Italy.—A 30 years' concession has just been granted to put down a plant to utilise the water power of the Varaita torrent at Venasia (Como) in the generation of electrical energy.

Water Power Works in Finland.—It is reported that works are about to be established to utilise the waterfalls of Narowain and Imatra, in Finland, the energy generated to be transmitted to St. Petersburg.

Workhouse Lighting.—The Kingston-on-Thames Guardians have decided to obtain a report upon the advisability of adopting electric lighting, and particularly as to whether it would be more economical to put down independent generating plant or to obtain current from the Kingston Corporation.

Workmen's Compensation.—A Home Office return is issued giving statistics of the proceedings taken during 1899 under the Workmen's Compensation Act, 1897, and under the Employers' Liability Act, 1880. The statistics published are very meagre, but are sufficient to show that the procedure under these Acts, and especially under the Workmen's Compensation Act, are becoming better understood.

TRADE NOTES AND NOTICES.

[*Notices for insertion under the above heading must reach the Office no later than first post Thursday morning. New Catalogues, Price Lists and similar matter should be sent early in the week.*]

TENDERS INVITED.

Hanley Electric Lighting committee invite tenders for two Lancashire boilers and fittings, including steam receiver; water-tank, girders, and pumps; fuel economiser, with engine or motor; smoke chimney, exhaust fan, with engine, &c; feed water heater, forced draught fittings, fire bars or other appliances to boiler furnaces, and coal conveyor and bunkers. Specifications from the borough engineer and surveyor (Mr. Joseph Lobley) and from the Corporation electrical engineer (Mr. C. A. Cowell). Tenders to Mr. Lobley before 25th inst. An advertisement contains further particulars.

Salford Corporation invite tenders for the supply and erection of lighting switchboard, traction switchboard, and balancing transformer. Specification, &c., may be seen at the offices of the consulting engineers (Messrs. Lacey, Clirehugh, and Sillar), 2, Queen Anne's Gate, Westminster, and 78, King-street, Manchester, but can only be obtained from the latter office. An advertisement contains further particulars, and tenders must be sent to the town clerk (Mr. L. C. Evans), Town Hall, Salford, by Sept. 3.

Salford Corporation also invite tenders for laying cables, tramway feeders, and street lighting. Tenders to town clerk by Aug. 13.

Aberdeen Corporation Tramways committee invite tenders for the supply of steel poles, bases, and brackets for extensions of their overhead system of tramways. Specification from the city electrical engineer (Mr. J. Alex. Bell), Cotton-street, Aberdeen. An advertisement contains further particulars, and tenders must be in by noon of 25th inst.

Aberdeen Council also invite tenders for the supply of 650 tons of steel girder straight-track tramway rails, 150 tons steel girder curve track rails, and 60 tons fish plates. Specifications may be obtained from the engineer (Mr. William Dyack), Town House, Aberdeen. An advertisement contains further particulars, and tenders must be lodged at the borough surveyor's office by noon of 24th inst.

The Asylums committee of the *London County Council* invite tenders for the installation of boilers, engines, dynamos, &c., at the Horton Estate, Epsom, Surrey. Forms of tender, &c., can be obtained after the 13th inst. from the clerk (Mr. R. W. Partridge), 6, Waterloo-place, S.W. Further particulars are given in an advertisement, and tenders must be delivered at the offices of the committee by 10 a m. of Sept. 22.

Portsmouth Corporation invite tenders for plant and apparatus for the equipment of their proposed tramway power station. Specification may be obtained from the tramways engineer (Mr. E. Botter), and further particulars are set out in an advertisement. Tenders must be delivered to the town clerk (Mr. Alex. Hellard), Town Hall, Portsmouth, not later than 10 a.m. of Sept. 4.

Portsmouth Corporation also invite tenders for street work in connection with the laying of electric lighting cables. Tenders to superintendent of generating station by 15th inst.

Fulham (London) Vestry invite tenders for wiring the Town Hall. Specifications may be obtained from the surveyor (Mr. Charles Botterill), and tenders must be delivered to the clerk (Mr. W. J. H. Denselow), Town Hall, Walham Green, London, S.W., by 4 p m. of Friday the 24th inst. An advertisement contains further particulars.

Whitby District Council invite tenders for the supply and erection of electricity generating plant, some particulars of which are set out in an advertisement. Specification may be obtained at the offices of the consulting engineers (Messrs. Preece and Cardew), 13, Queen Anne's-gate, Westminster. Tenders, addressed to the clerk (Mr. Wm. Seaton Gray), Council's offices, Whitby, must be in before noon of Sept. 3.

Worthing Corporation invite tenders for the supply and erection of electricity generating plant, particulars of which are set out in an advertisement. Copies of specifications, &c., may be obtained from the consulting engineers (Messrs. Burstall and Monkhouse), 14, Old Queen-street, S.W., after the 15th inst. Tenders, addressed to the town clerk (Mr. W. Verrall), must be delivered at the town clerk's office, Worthing, not later than noon of Monday, Sept. 3.

The *Pacific Cable* committee invite tenders for the supply and laying in the Pacific Ocean of 8,272 nautical miles of telegraph cable between Vancouver and Queensland. Forms of contract, &c., from and tenders to Messrs. Clark, Forde & Taylor, 4, Great Winchester-street, London, E.C., by noon 14th inst.

Newcastle-on-Tyne Corporation invite tenders for constructing about 5 miles of double-track tramway. An advertisement contains further particulars, and tenders addressed to the New Tramways committee must be in by Wednesday, 22nd inst.

Central Electric Supply Co. invite tenders for dry back marine boilers with mountings, feed and drain pipes, &c. (or, alternatively, water-tube boilers). Tenders to general manager (Mr. F. J. Walker), 19, Carnaby-street, Golden-square, London W., by 10 a.m. Aug. 20.

South London Electric Supply Corporation invite tenders for condensing plant. Tenders to secretary (Mr. H. H. Boyer), Bengeworth-road, Loughborough Junction, S.E., by 14th inst.

Newport (Mon.) Guardians require tenders for the electric lighting of their new workhouse, Stow Hill. Tenders to clerk by 22 inst.

Accrington Corporation invite tenders for about 50 electricity meters. Tenders by 15th inst.

Belfast Electric committee invite tenders for auxiliary feed water heater, &c. Tenders to town clerk by noon 15th inst.

Luton Town Council require tenders for watt and demand meters. Tenders to town clerk by Sept. 14.

Warrington Corporation invite tenders for wiring Parr Hall and markets. Specification from Mr. W. H. Grimsdale, Bank House.

Plumstead (London) Vestry invite tenders for electricity generating plant. Tenders to Vestry Clerk, Vestry Hall, Maxey-road, Plumstead, S.E., by Sept. 19.

Grimsby Corporation invite tenders for additional steam dynamo and extension of switchboard. Tenders to town clerk before 18th inst.

Bradford Guardians invite tenders for an electric lighting installation at their workhouse. Tenders to clerk by noon Aug. 13.

Dorking District Council invite offers for leasing their provisional order. Tenders to clerk by 30th inst.

Digitized by Google

Stockport Tramways committee invite tenders for 20 double-deck tramcars with electrical equipment. Tenders to clerk by Aug. 31.

Cardiff Corporation invite tenders for pipes, feed-water heater, &c., at the electricity works. Tenders by Aug. 13.

Leeds Guardians invite tenders for an electric lighting installation at the Poor Law Offices. Tenders by noon Aug. 14.

Tenders are required for the electric lighting (about 800 lights) of the Fife and Kinross District Lunatic Asylum. Particulars from the clerk, Cupar, Fife.

A central telephone building is to be erected at *Budapest*, and tenders are invited for: (1) The complete installation of the local telephone exchange on the basis of 10,000 subscribers at first, but liable to be enlarged (if required) up to 20,000 subscribers; (2) the supply of an intermedial connecting board for equalising the work between the operators; (3) complete installation of the inter-urban telephone exchange; (4) supply of a cross-connecting board for the two exchanges (with lightning arresters), and other protecting contrivances for the cables; (5) the supply of all materials, insulated wires and cables, &c.; (6) the execution of all the work in connection with the contract, including fitting, mounting and connecting, testing, regulating, &c. The conditions include a deposit of 60,000 crowns. Tenders are due by Oct. 15. Conditions, &c., from the Royal Hungarian Direction of Telephones, Budapest (VI. Szerecsenutcza 7–9) on payment of 10 crowns.

The Civil Government of the province of *Ciudad Real* invite tenders until the 24th inst. for erecting and working a telephone exchange in the town of Ciudad Real.

TENDERS RECEIVED AND ACCEPTED.

The following tenders have been accepted by the Hammersmith (London) Vestry:—

Callender's Company, low tension distributor cables and boxes, estimated at £4,062.

W. T. Glover & Co., high tension feeder cables, estimated at £1,151.

Watson, Gow & Co., 200 tons of 2in. cast-iron pipe (£7. 5s. per ton) and 4 tons of specials (£9 per ton), £1,486.

Liverpool Corporation have given an order to Messrs. Willans & Robinson, Rugby, for three sets of plant similar to those on order for the Lister-drive and the Pumpfield generating stations, at £6,939 per set, less 2½ per cent.

Messrs. W. T. Glover & Co. have secured a large order for "Diatrine" cable from the Manchester Corporation.

The tender of Messrs. Simpson Bros., Hapton, has been accepted for the electric lighting of Hapton (Lancs.), from Sept. 1 to April 30, at £122.

The Southend Town Council have let the contract for the construction of a light electric railway in the district and for the supply of the necessary generating plant, &c. to Messrs. Dutilh-Smith, McMillan & Co., London and Philadelphia, at £87,500.

South Shields Guardians have accepted the tender of Messrs. Falconar, Cross & Co. for an electric lighting installation at the workhouse at £1,969.

APPOINTMENTS VACANT AND FILLED.

The tramways department of the Glasgow Corporation require a first-class mechanical engineer to take charge of the steam plant and general oversight of the tramways power station. Salary £250 per annum. An advertisement gives further particulars, and applications have to be sent to Mr. John Young, general manager, 88, Renfield-street, Glasgow, by Aug. 20.

Hull Electric Lighting committee have vacancies for two electrical improvers. Applications to the Chairman of committee, Town Hall, Hull, by noon of 23rd inst. Mr. A. S. Barnard is city electrical engineer. See advertisement.

Applications are invited for the position of senior demonstrator in electrical engineering at the South Western Polytechnic, Manresa-road, Chelsea, London, S.W. Forms of application from the secretary. See advertisement.

The position of senior demonstrator in applied physics, at the South-Western Polytechnic is vacant. Particulars from secretary up to 13th inst. See also advertisement.

An assistant lecturer and demonstrator in electrical engineering is required for the Croydon County Polytechnic. Applications to chairman of committee (Mr. J. W. Helps), by Aug. 14. See advertisement.

Jandus Electric Co., Hartham-road, Holloway, London, N., require an assistant draughtsman and an assistant electrician. See advertisement.

The Hartley Council require a principal and professor of physics for the Hartley College, Southampton. Applications by Sept. 1.

Mr. F. G. Jones, late of the Brompton and Kensington Electricity Supply Co., has been appointed assistant engineer at the Wakefield Corporation electricity works.

BUSINESS NOTICES.

Correction.—In a note on p. 578 of our last issue a clerical error occurred. Mr. S. J. Atkinson has entered into partnership with Mr. W. Schmahl at Grainger-street, Newcastle-on-Tyne, and the business will continue under the style of Atkinson, Schmahl & Co.—not Dickinson, Schmahl & Co. as stated in error.

Increasing business in the Northern provinces has necessitated the British Thomson-Houston Co. opening a branch at St. Nicholas-chambers, Newcastle-on-Tyne.

Messrs. Crampton & Co., electrical engineers, Great Yarmouth, Cambridge, and Bury St. Edmunds, have opened offices at 77a, Queen Victoria-street, London, E.C. Telephone 6057 Bank.

BANKRUPTCIES, LIQUIDATIONS, &c.

St. Stephen's Electrical Syndicate (Ltd.) is to be wound up voluntarily. Mr. H. Ebbsworth, 1, Arthur-street East, King William-street, London, E.C., is liquidator.

In the bankruptcy of Hy. Howe, electrician, 16, Bold-lane, Derby, the first meeting of creditors will take place on Aug. 14, at 47, Full-street, Derby, the public examination on Sept. 11 at the Court House, Derby.

In the bankruptcy of F. W. Henton (F. W. Henton & Co.), electrical engineer, 24, King William-street, London, W.C., the trustee has been released.

In the bankruptcy of L. J. Lawrence (trading as Lawrence & Butcher), electrical engineer, 5, Stafford-street (late Bond-street), London, W., the trustee has been released.

Plant for Sale.—Messrs. Wheatley Kirk, Price & Co. announce in an advertisement the sale by public auction, at Ormonde Works, Hornchurch-road, Romford, Essex, on Tuesday and Wednesday 28th and 29th inst., of a large quantity of high-class engineering plant, machinery, shafting, loose tools and utensils, accessories, &c. Catalogues may be obtained of the liquidator, Mr. Wm. Hutton, 39, Bennett's-hill, Birmingham; of Messrs. Hargreaves & Heaton, solicitors, Waterloo-street, Birmingham; or of the auctioneers, 49, Queen Victoria-street, London, E.C., and Albert Chambers, Albert-square, Manchester. The sale commences each morning at 11 a.m.

Messrs. Wheatley Kirk, Price & Co., Albert-chambers, Albert-square, Manchester, have a 225 I.H.P. compound vertical steam engine (marine type) for sale. Further particulars are given in an advertisement.

Business for Sale.—The business of P. C. Middleton & Co. (Ltd.) (in liquidation), electric light and power engineers, Aberdeen, Edinburgh, &c., is for sale as a going concern. Some further particulars are given in an advertisement, and communications should be addressed to the liquidator (Mr. John Packman), 258, Union-street, or Mr. W. R. Reid, advocate, 46A, Union-street, Aberdeen.

Tramway Traction Patent for Sale.—Offers are invited for a one-fifth share in Lane's electro-magnetic system of traction. Further particulars are given in an advertisement, and applications should be sent to Mr. Lane, 6, Corporation-street, Birmingham.

B.T.H. Plant.—Pamphlet No. 70 of the British Thomson-Houston Co. describes magnetic blow-out lightning arresters for direct currents Several types of these arresters are shown.

Westinghouse Plant.—Circular No. 1,029, issued by the British Westinghouse Co., deals with polyphase induction motors, type C.

Electrical Accessories.—The 13th edition of the electric bell and general catalogue of the General Electric Co. is just issued and comprises electric bells, electric signalling devices, batteries and accessories. The company state that, notwithstanding the many improvements introduced considerable reduction has been made in the price of many of the articles described. A group of diagrams of connections and circuits is given, accompanied by simple explanatory notes and instructions. The list can be obtained gratis post free by the trade.

Exports of Electrical Apparatus and Material.—The following list gives official particulars of the exports of British manufactured electrical apparatus and material (including telegraph and telephone wire and material, but not including electrical instruments or machines, which are not separately specified) from Aug. 1 to Aug. 8, with the ports of destination:—

Africa—Cape Town, £386 (including £200 telegraph apparatus); Durban, £1,045 (including £720 telegraph material); East London, £643; Port Elizabeth, £1,450. *Argentina*—Buenos Ayres, £779 (including £225 telegraph material); Parana, £2,014. *Australasia*—Adelaide, £273; Auckland, £1,573; Brisbane, £950; Fremantle, £125; Hobart, £150; Melbourne, £870; Nelson, £297; Perth, £126; Sydney, £688; Wellington, £2,615 (including £1,831 telegraph material). *Azores*, £2,382 (telegraph apparatus). *Belgium*—Ostend, £420. *British Guiana*—Georgetown, £150. *Ceylon*—Colombo, £45. *China*—Shanghai, £150 (old telegraph wire). *Gibraltar*, £200. *Holland*—Amsterdam, £30 *India*—Calcutta, £350. *Japan*—Hiogo, £15; Nagasaki, £92. *Malta*, £100. *Straits Settlements*—Singapore, £16. *United States*—New York, £500,375

Digitized by Google

(telegraph cable). Total (for eight days) £518,303, against £63,542 for the corresponding eight days last year (Aug. 2 to Aug. 9).

A New Ceiling Rose.—The illustration below shows a new two-way ceiling rose for 200-250 volts pressure. It is provided with three contacts for a triple flexible cord, and thus will be found useful in cases where it is desired to turn on one, two, or three lamps in a pendant fitting from two wall switches. The base is solid, the illustration being full size, and the terminals are sufficiently large to

take two wires if the "looping" system is employed. The holes in the bridges and the screws for the "flexible" are also large enough for two or three cords—often a convenience for shop-window lighting. We are informed that the price is moderate, that the parts are all made in England, and that the ceiling rose may be obtained from the Sun Electrical Co. and other wholesale houses.

PATENT RECORD.

The following list of Applications for Patents and Specifications published has been compiled for this journal by Messrs. J. C. Chapman and Co., *Chartered Patent Agents, of 70, Chancery-lane, W.C., from whom any available information in connection with Patents, Designs, and Trade Marks may be obtained.*

APPLICATIONS FOR PATENTS.

Note.—*The undermentioned Applications are not open to public inspection until after the acceptance of the complete Specification. The names within parentheses are those of communicators of inventions. When complete specification accompanies application, an asterisk is affixed.*

COMPANIES' MEETINGS AND REPORTS.

British Electric Transformer Manufacturing Co. (Ltd.)

The second ordinary general meeting of this Company was held on Friday last, Mr. R. STEWART BAIN, C.A. presiding.

The SECRETARY (Mr. J. C. Wrist) having read the notice calling the meeting,

The CHAIRMAN said: Gentlemen, the business done during the year has been quite up to our expectations. Our turnover has been £24,043. 8s. 10d., compared with £12,614. 16s. 6d. for the previous, our first year. It will be seen, therefore, that we have nearly doubled our output. Turning to the debit side, you will see that our manufacturing charges were £13,448. 11s. 4d., equal to about 56 per cent. of the turnover, as compared with £10,230. 1s. 9d., or equal to about 81 per cent. of the turnover for the last year—a decided improvement. Our general charges amounted to £2,433. 9s. 9d., as compared with £1,242. 2s. 10d., the percentage in both years being about 10 per cent. of the turnover. The amount written off for depreciation is £714s. 3s. 8d., as compared with £365. 3s. 8d. for last year, or nearly double. This has been done under the advice of our auditors, and represents a full depreciation on our plant and machinery. After deducting all these charges, there is left a profit of £6,184. 8s. 9d. for the year as compared with £998. 2s. 9d. for last year, which I think you will agree with me in considering a very satisfactory result. I now ask your attention to the balance-sheet. Our first and principal asset is the amount which we paid for our patents, viz., £25,336. 6s. 5d. Since I last had the pleasure of addressing you, we have succeeded in obtaining letters patent for our transformers in Germany, one of the most valuable of our foreign patents, and the addition of £86. 6s. to this item during the present year is in connection with the obtaining of this patent. Our transformers are now covered by letters patent in the following foreign countries: Germany, France, Belgium, Italy, Austria, Switzerland, United States of America, New South Wales, South Australia, West Australia, Queensland and Tasmania. We have recently been approached in connection with the purchase of the French patent. We have not been in a hurry to sell this or any other patent, one reason being that we were desirous of seeing the result of the year's trading before concluding a bargain, and the result has justified our policy. Our transformers are being exhibited at the Paris Exhibition, which entitles us to add an additional six months to the time within which we must work the patent in France. The average time which each of our patents has still to run is 11 years, and, although we are of opinion their value should not be depreciated in the balance-sheet, we considered it would be prudent to set aside the sum of £2,500 out of our profits as the nucleus of a reserve fund for the purpose of gradually writing this asset down. The next item is plant and machinery, £2,473. 12s. 9d. The additions during the year amounted to £374. 16s. 2d., and we have written off depreciation £494. 13s. 5d., or nearly 20 per cent., in addition to charging all repairs and renewals to revenue. Expenditure and alterations to works has cost £806. 14s. 6d., and you will see that we have now written it all off save £200, so that by the time we leave our present works the item will have disappeared entirely. The stock, as per manager's valuation, taken at cost price, is £3,482. 8s. 4d., and the work in progress amounts to £1,165. 0s. 5d. This last item is slightly less than last year, but on the other hand we have orders in hand of no less than £6,769, so that our prospects for the present year are as favourable as the one we are now dealing with. The amount due from our customers is £9,138. 11s. 3d. A large proportion of this is due by municipal corporations, who retain amounts varying from 10 per cent. to 20 per cent. on their contract for a year. On the other side of the account, you will see that our total issued capital is £40,000, viz., £20,000 subscribed and £20,000 in vendor's shares, which latter do not rank for dividend until the subscribed shares have received 10 per cent. for one complete year. As we propose at this meeting to recommend that a dividend of 10 per cent. be now paid, these 20,000 vendor's shares will rank pari passu with the subscribed shares as from July 1, and, considering the very excellent results we have achieved, I do not think anyone here will grudge Mr. Berry participating in our success. Of course, it will mean in the future that we shall have double the capital upon which to pay dividends, but you will notice we have taken that into account in our report by carrying forward a very substantial amount to next year. £5,552. 15s. 5d. is the balance of profit and loss account after deducting an interim dividend at the rate of 10 per cent. which we paid in February. The lease of our present works expires next year, and, as the buildings are coming down, this lease cannot be renewed. We have decided to purchase a plot of freehold land and erect our own works. The negotiations for the purchase of the land are now nearly completed, and we expect to be able to pay for this and erect and equip our works without increasing our present capital. I now move the adoption of the report and accounts.

The resolution was carried unanimously.

Mr. R. Stewart Bain was re-elected a director, and the auditors having been re-appointed, a hearty vote of thanks to the chairman and directors terminated the proceedings.

W. T. Henley's Telegraph Works Co. (Ltd.).

An extraordinary general meeting of this Company was held at the Cannon-street Hotel, E.C., yesterday (Thursday) for the purpose of considering and, if thought fit, passing resolutions increasing the capital of the Company from £300,000 to £400,000, the ordinary capital being increased by 10,000 new shares of £5 each and the preference capital increased by 10,000 new shares of £5 each. Mr. SYDNEY GEDGE, M.P., presided.

The CHAIRMAN observed that the business of the Company had increased so much as to render it absolutely necessary that they should have more capital, and, he might add, there was the possibility—he ought not to use a stronger term—that the Company might obtain a contract for one of the three sections of the Pacific cable for which tenders were being invited. The Company's tender and estimate would be made up to-morrow, and he need scarcely say that if their tender was accepted, and they should have the privilege of being one of the three companies to join in that great enterprise, the Company would want all the money they could obtain. Should their estimate be accepted, the Directors might have to come again to the proprietors in regard to further capital, but he thought that this would not be the case, and that with the capital they were then asking power to raise the Board would be able to carry out all the work. The Directors had not yet made up their minds at what price the ordinary shares would be offered to the ordinary proprietors, but, following the precedent which had been set on each occasion when new capital had been issued, he thought that the shareholders might take it for granted that the price would be such as to give a good bonus to those ordinary shareholders who subscribed. On the assumption that the new capital was taken up at the price of £10 per share, the Company would get £50,000 in return for £25,000 new ordinary capital, and the £25,000 preference capital would provide another £25,000, making £75,000 in all, and this additional money he hoped would be sufficient for their purposes unless they were fortunate enough to obtain one of the Pacific cable contracts and then, probably, they would have to issue the other £25,000 of the two classes of capital, for which they would again hope to receive another £75,000. However, he could not pledge the

Digitized by Google

Directors to exact figures, and he only stated this as the probable outcome of the meeting. With the £75,000 additional capital they would be able to carry on the work without the restrictions at present tying their hands. With regard to the increase in the business, he would mention that it had been very steady for several years, and that it had increased at least 100 per cent. every three years. That was to say, the present business was 30 per cent. more than this time last year, and taking it year by year, it had doubled itself every three years. The proprietors would quite understand that the business could not be doubled in this way without additional capital. However, he hoped the experience of the past would convince the shareholders that the Board were not increasing the capital to a greater extent than was absolutely necessary, or that it was being raised to a larger sum than the Directors saw their way to earn dividends upon. It was to be hoped that the preference shareholders would subscribe for the preference shares, which they would obtain at par as compared with the market price of about £5½. He concluded by proposing resolutions for increasing the capital as mentioned.

Mr. WILLIAM SEAL seconded the motion, which was unanimously passed.

At separate meetings of each class of shareholders—the preference and ordinary—subsequently held, resolutions were passed sanctioning the adoption of all the special resolutions agreed to at the extraordinary general meeting.

Waterloo and City Railway Company.

The thirteenth half-yearly meeting was held yesterday, at Waterloo Station, Mr. WYNDHAM S. PORTAL presiding.

The CHAIRMAN, in moving the adoption of the report, stated that the gross receipts for the half-year, after deducting Government duty, amounted to £14,069 compared with £13,093 in the corresponding six months, and the working expenses to £7,773 against £6,640. The difference between these two sums not being sufficient to pay a dividend of 3 per cent., the London and South Western Railway Co., under their working agreement, had provided the deficiency of £2,375. Including season ticket holders, 1,868,737 passengers had been carried, an increase of 152,912 for the half-year. As a neighbouring company he was sure that they would all join in offering their congratulations to the Central London Railway Co. on the successful completion of that undertaking, and it was to be hoped that the two lines would benefit each other. So far, during the current half-year the receipts on the Waterloo and City line had continued to show a steady increase. Up to the end of last June the total capital outlay had been £589,073, the expenditure during the past half-year having been as follows: On construction of way and stations £10,000, on engineering £800, and on electrical equipment £4,400 odd. In conclusion he expressed regret at the death of Lieut.-Gen. Sir Frederick Marshall, a director, and stated that Mr. F. J. Macaulay had been elected to a seat on the board.

Lieut.-Col. the Hon. W. H. CAMPBELL seconded the motion.

Mr. BEAVIS considered that the report was satisfactory and said that everything appeared to be going on all right. He asked the amount of the total indebtedness of the company to the working line, and said he supposed that the amount would have to be paid before a higher dividend than 3 per cent. could be paid.

Mr. STURDY thought that the facilities afforded by the line, in conjunction with the Central London Railway, ought to be more widely known, and suggested that 55 per cent. of the gross receipts was rather a high rate to charge for working such a line.

The CHAIRMAN, in reply, said that the total indebtedness of the company to the London and South Western Company was £8,712, which would have to be liquidated before more than 3 per cent. could be declared in the way of dividend.

The motion was unanimously agreed to.

CASTNER-KELLNER ALKALI CO. (LTD.)—At an extraordinary meeting on Wednesday it was resolved to purchase the undertaking of the Aluminium Co. (Ltd.), with certain exceptions, and for carrying out the agreement to purchase the directors were authorised to borrow, in addition to £150,000 already authorised, a further sum or sums not exceeding £120,000. At the same time it was decided to increase the capital from £300,000 to £450,000, in £1 shares, and to make certain alterations in the articles of association. The chairman (Mr. W. Mather, M.P.), stated that ever since the works were established and the successful prosecution of the industry had been proved the directors had been considering the importance of the future development of the undertaking and to add to it other branches of chemical manufacture. He was convinced that the proposed union would be mutually beneficial. The amalgamation would probably result in a considerable increase in the company's profits and in great economies being effected.

CENTRAL LONDON RAILWAY CO.—The ordinary general meeting was held on Wednesday. The chairman (Sir Henry Oakley), who moved the adoption of the report, which appeared in our last issue, congratulated the shareholders on the successful completion and opening of the line. There was every indication that the most sanguine estimates of its utility and popularity with the public would be realised. They expended only about £185,000 for the last half-year, and that was due to the fact that the body of the work had been completed, and that the lighter work of the stations, electrical machinery, lighting, &c., did not absorb so much money. Having carefully revised all their estimates of work yet to be done and paid for, they had every reason to believe that the whole undertaking would be completed for the original capital, and that unless their business so expanded as to render further larger expenditure necessary, they should not, at all events for the present, require any authority to raise further money. There was a large sum due to the contractors, but that was according to an arrangement made in the early days by the board. The contractors were to be paid a portion of their expenditure by debentures, but those debentures were not to bear interest until the line had been completed and open for traffic. The additional incentive of the interest on £500,000 remaining unpaid probably encouraged the contractors to display increased exertions. They opened the line for traffic on July 30. They began at 5 a.m. and started a series of trains five minutes apart. They established a general or average fare of 2d. for any distance. From the moment of its opening it had shown one continued success. The very first morning the trains to the City were crowded, and they had remained crowded ever since, with the additional advantage that the mid-day trains also filled extremely satisfactorily. The first day they carried 85,400 people, on Tuesday 91,900, on Wednesday 86,700, on Thursday 96,100, on Friday 80,700, and on Saturday 100,444. On Sunday last the number was 64,742, on Monday (Bank Holiday) 100,391, and Tuesday 105,170. There could be no reasonable doubt, therefore, that the public very much appreciated the services they had rendered. Their trains now run every five minutes; in two or three days they should run them every four minutes, and as fast as they could get complete trains ready, electrically fitted so as to rely on their working, they should get down to 3½ minutes or three minutes between each train: so that, as far as possible, they should remove all ground of complaint of overcrowding. The motion was seconded by Lord Rathmore and adopted.

GAS LIGHT AND COKE CO.—At the half-yearly meeting on Friday the chairman (Col. Makins) referred to the increase in the price of gas. He said that the rateable value of the company's undertaking was at present £730,000, but it had just been revalued at £791,800. Should the revaluation be confirmed consumers of gas in the company's district would have to bear the burden of a further addition to the price of gas. It could not too often be repeated that, in accordance with the terms of their deed of co-partnership, the act of 1876, whatever additional charge this company had put upon it, five-sixths must be borne by the consumers and one-sixth by the shareholders, and vice versa out of any savings or advantages which came to the company five-sixths went to the consumers and one-sixth to the shareholders. Though they had some 360,000 consumers, they had received protests against the recent rise from a quite insignificant number of them. [Perhaps the poor gas consumer has learnt the value of protest.] To meet the increase in the cost of coal, they had no funds available except the gas rental and the dividend account. He complained of the somewhat harsh and unfair treatment meted out to them by their critics. The charges against them always took the same form, because another company, acting under similar legislation, could make a sale of gas at a lower price than the Gas Light and Coke Co., therefore the management of the latter company must be bad. The differing circumstances of the two companies made the cases absolutely incomparable. The increase of the southern company's business for the past half-year had been 12¼ per cent.; their company's was 3¼ per cent. Taking the whole period, over which a comparison could be made, the figures were 136 per cent. and 46 per cent. Of course, too, the competition of electric lighting did not affect the southern company to anything like the same extent.

NEW COMPANIES, STATUTORY RETURNS, &c.

BRITISH ELECTRIC CAR CO. (LTD.)—This company was registered on Aug. 2 with a capital of £50,000, in £1 shares, to manufacture and deal in rolling stock for tramways and light or other railways, and to carry on the business of motor car, &c., builders. The subscribers are A. K. Baylor (electrical engineer), G. J. Jackson, W. M. Murphy (civil engineer), A. S. Tuffin, E. Moss, E. Beckett, and E. T. Botwright. Mr. A. K. Baylor is the first chairman.

NORTHERN ENGINEERING CO. (LTD.)—This company was registered on Aug. 2 with a capital of £30,000, in £1 shares, to acquire the business carried on by the Northern Engineering Co. (Ltd.), at Halifax, and to carry on the business of machine tool makers, electrical and general engineers, &c. The first directors are H. Longsdon, W. Partington, and S. Hey.

CITY NOTES.

MEMORANDA.—Bank rate 4 per cent. (since July 19, 1900). Price of silver 28 1/16d. per oz. (Aug. 9). Consols (2¾ per cent.) 97⅞—97⅞ for money, 97⅞—98 for account; 2½ per cent. 96¾—97¼ (Aug. 9). Stocks and Shares Continuation Days, Aug. 13 and 28; Ticket Days, Aug. 14 and 29; Pay Days, Aug. 15 and 30; Mining Share Carry-over Days, Aug. 11 and 27.

CITY OF LONDON ELECTRIC LIGHTING CO. (LTD.)—Warrants for payment of a 6 per cent. interim dividend for the half-year ended June 30 on the preference shares have been posted.

GREAT NORTHERN RAILWAY CO. (IRELAND).—In the directors' report for the half-year ended June 30, it is stated that the bill for the incorporation of a company with power to purchase the undertaking of the Bessbrook and Newry Electric Tramway Co., and for the construction of a light railway from Bessbrook to Tynan had received the Royal Assent. The new Great Northern Hotel at Bundoran had been fitted with a complete electric lighting installation.

HOVE ELECTRIC LIGHTING CO. (LTD.)—The directors have declared an interim dividend at the rate of 7 per cent. per annum for the half-year ended June 30. The dividend will be paid on Oct. 15.

Digitized by Google

NATIONAL ELECTRIC SUPPLY CO. (LTD.).—It has been decided to increase the capital of the company to £184,943. 15s. by the creation of 20,000 new shares of £5 each, to rank pari passu with the preference shares. The Chairman (Mr. J. Booth) said the company was now doing very well indeed. Last year was the best year they ever had, and so far they were this year able to show a substantial increase of profit over last year in spite of the greatly advanced price of coal. They expected a very busy winter, and hoped to have their new engine and boiler-house ready in time for it. They were sometimes asked about the proposed electric trams. With their new machinery they should be in a position to supply current for the trams at a lower rate than the Corporation or a separate company could possibly generate it for themselves, and hoped to be able to show the Corporation that it would be a waste of ratepayers' money to erect a separate generating station.

NORTH METROPOLITAN TRAMWAYS CO.—At the meeting on Wednesday the chairman (Mr. George Richardson) stated, in reply to a question, that the adoption of electric traction depended on the London County Council. That body had not yet made experiments on their own line, and until they did so nothing could be done by the directors.

ROYAL ELECTRIC CO. (MONTREAL).—At the recent annual meeting of this company an agreement with the Chambly Electric Co., which provides that the Royal Company shall purchase all the electric power developed by the Chambly Company for 50 years at the rate of $15 per H.P. for the first 15,350 H.P., and $10 per H.P. for any amount in excess of this was ratified. The contract does not affect the agreement with the Montreal Street Railway Co. The Royal Company takes an additional $90,000 of stock and $30,000 of bonds of the Chambly Company. The shareholders of the Royal Co. afterwards sanctioned the sale of their holdings in the Chambly Company to Mr. James Ross for $791,000.

SMITHFIELD MARKETS ELECTRIC SUPPLY CO. (LTD.)—In a circular just issued to the shareholders it is stated that the business of the company has progressed and is progressing satisfactorily. Within the past few weeks 30 new installations have been obtained in the Central Markets. The number of units sold for the half-year to June 30 amounted to 367,306, against 174,827 for the corresponding period of 1899.

STOCK EXCHANGE NOTICES.—The Stock Exchange committee has been asked to allow 9,400 further ordinary £5 shares of *Edmundson's Electricity Corporation (Ltd.)* to be quoted in the official list. Tuesday, Aug. 14, has been appointed a special settling day in the further issue of 20,000 5 per cent. cumulative preference £5 fully-paid shares (Nos. 20,001 to 40,000) of *Callender's Cable and Construction Co. (Ltd.)*, and the committee has ordered the securities to be quoted in the official list.

NOTES.

IT is pleasing to learn that the reception which British electrical engineers have accorded to their American *confrères* during the past week has afforded much gratification to the latter. Some thirty Americans accepted the invitation of the Institution of Electrical Engineers to visit London and enjoy the varied programme described in our issue last week, p. 588. Owing to a fortunate improvement in the weather almost at the last moment, the river trip in electric launches proved a great success, and was enjoyed by some 50 guests and others. On Monday visits were paid to several works of electrical interest, including the Central London Railway. This latter was unanimously admitted by the American engineers to surpass any example of electric traction in the United States.

ABOUT 30 guests besides a number of members of the Institution, making a party of 76 all told, spent Monday evening in an agreeable manner at the Princes' Restaurant, Piccadilly, with Prof. PERRY in the chair. A well-served repast was followed by a number of lively speeches, and at times the fun was fast and furious. Following the toasts of "The Queen" and "The President U.S.A.," Mr. H. H. CUNYNGHAME, C.B., proposed, and Mr. J. S. RAWORTH seconded "Our Guests," the toast being responded to by Mr. CARL HERING, President of the American Institute, Prof. F. B. CROCKER and Mr. C. O. MAILLOUX. Prof. PERRY was repeatedly chaffed at his novel arrangement of double and treble-barrelled speakers.

ONE speaker perceived the fitness of things in there being two-phase speakers on what he termed the primary side, and a three-phase system on the secondary—a sort of "Scott system" of oratory! It needed, he said, a three-phase system on the secondary side to take all the heavy load of British hospitality. One of the most humorous speeches was that of Mr. R. W. POPE, Secretary of the American Institute, who proposed the impersonal toast of "Electrical Engineering," this being seconded by Mr. W. M. MORDEY and responded to by Prof. S. P. THOMPSON and Dr. A. E. KENNELLY. Tuesday the guests spent in visiting a number of engineering works, and on Wednesday they left in company with a large contingent of British electrical engineers for Paris.

IN a long communication addressed to the new POSTMASTER-GENERAL, and occupying four newspaper columns of small type, Mr. HENNIKER HEATON has formulated his ideas on postal and telegraph reforms, and without Lord LONDONDERRY'S permission has caused it to be published in *The Times*. We confidently say without his lordship's permission because nobody receiving such a letter, couched in terms so fulsome in its flattery and so offensive to his predecessors would have desired to see it in print. Mr. HEATON'S bad taste, however, has its compensations. After what he has said about the present POSTMASTER-GENERAL compared with all POSTMASTERS-GENERAL in the past, it will be impossible for Mr. HEATON to complain if he gets an answer not exactly to his liking. The wisest and most business-like of chiefs who have ever controlled the Post Office, according to the member for Canterbury, will have no difficulty whatever in disposing of that member's arguments or in dismissing most of his recommendations. Of the postal portions of his programme we will say only this, that if they are supported on no better ground than the telegraphic, Mr. HEATON has much to learn before he can be considered an authority. A halfpenny postcard ought to be sold at its face value; but we do not need a member of Parliament to tell us that: nor can he take credit for obvious concessions which time and opportunity are sure to bring about without his interference. His arguments are all wrong, and do not help matters in the least.

THIS, at all events, is true of his recommendations for improving the telegraph service. He begins with a complaint that the Post Office demand 2d. for a receipt in respect of telegraph charges, whereas the cable companies give one for nothing.

Digitized by Google

The probable explanation is that the Post Office take but a fraction of the total charge, whereas the companies take the whole of it. In a like fashion Mr. HEATON argues that because the charge for inland telegrams in England, France, Belgium, Holland, and Germany is a halfpenny per word, the rate between England and these countries should be the equivalent of the two local rates—that is to say, 1d. per word instead of 2d. Leaving the cables connecting these countries out of account, we might, with just as much reason, demand similar rates to Spain and the Azores, and even to America. The fee for registered addresses should, he thinks, be abolished, chiefly, it seems, because it brings in a revenue of £60,000 per annum. To our thinking it ought to be abolished because it robs the revenue of its legitimate charge for addresses, which ought to be written at length. But Mr. HEATON is in favour of free addresses, and would virtually extend the limit of words to 20. Seeing that the telegraph service does not pay with a 12-word limit, it is hard to understand how Mr. HENNIKER HEATON can expect it to bear this additional burden.

UPON Mr. HENNIKER HEATON'S demand that all submarine cables and all telephone lines should become Government property we need not spend many words. His description of the telephone service is not overdrawn; but, unfortunately, it is almost past mending, and this chiefly through the mischievous meddling of reformers like himself. As to the great submarine cables, their transfer to the State has never been within the range of practical politics, and is further off than ever now that other countries are threatening competition in that line of business.

WRITING to the *Glasgow Herald* of last Saturday, Mr. H. A. MAVOR has attempted to show that experience in electric transmission schemes "goes to prove that electric transmission of power which has been profitable has been associated with development of new districts, and has depended for its financial success on increased capital value of land." The writer apparently seeks to recommend the moral to those who contemplate investing in projected electrical power schemes in this country. There may be some truth in what Mr. MAVOR says; indeed, to a certain extent, it is self-evident that electric power transmission *has* developed the capital value of land. The case of Niagara is cited. But it is easy to point this moral too markedly and to over-adorn the tale. Why has land improved in value at Niagara? Simply because electric power there has proved cheaper than steam power at Buffalo or Pittsburg. Mr. MAVOR puts forward as a prime cause what is only an incidental effect. If the success of electric power transmission requires that land should be developed in capital value, why is so much of that power being transmitted from Niagara across miles of waste land into the heart of Buffalo city?

BUT though we cannot agree with Mr. MAVOR in his supposed reasons, we are quite in sympathy with him in his desire to warn intending investors against unprofitable electric power schemes. It is to be feared that the measure of encouragement now vouchsafed by Parliament to this class of commercial venture will lead in the immediate future to some ugly company promoting. All well-wishers of electrical progress hope to the contrary; but the danger undoubtedly exists, and the best that can be done is to warn the investing public against the black sheep which are to be found in every fold, and to advise them to look well into the individual merits of each promotion before parting with their money.

University College (Bristol).—The 1900-1901 session begins on Oct. 2.

The Telephone in Madagascar.—The first telephone in Madagascar was opened on Wednesday, the 8th inst., Antananarivo and Tamatave being connected.

Heriot-Watt College, Edinburgh.—The 1900-1901 session commences on October 2nd and extends to June 7, 1901. Particulars of the day classes can be obtained from the librarian.

Battersea Vestry Electric Supply Station.—The ceremony of laying the foundation stone of the new electric supply works of the Vestry of Battersea will take place to-morrow (Saturday) at 3:30 p.m., the ceremony being performed by Mr. W. Matthew, J.P., chairman of the Vestry.

Sunderland Corporation Electric Tramways.—The official opening of these tramways took place on Wednesday last, the 15th inst., the ceremony being performed by Councillor Trewhitt, the chairman of the Tramways committee. Power is supplied from the Corporation electric lighting station.

Cable Interruptions:—	Date of Interruption.
Latakia—Cyprus	June 21, 1899
Cayenne—Pinhieros	Oct. 11, 1899
Tangier—Tarifa	Jan. 5, 1900
Ceara—Maranham	Feb. 20, 1900
Pará—Maranham	Mar. 2, 1900
Môle-St. Nicolas—Cap Haitien	Mar. 7, 1900
Serena—Valparaiso	Aug. 2, 1900
Iquique—Valparaiso	Aug. 2, 1900

The Paris Meeting of the Iron and Steel Institute.—Under the presidency of Sir William Roberts-Austen, the Iron and Steel Institute will hold its autumn meeting in Paris from Sept. 18 to Sept. 21 inclusive. A number of metallurgical papers will be read, and the meeting will, of course, include visits to the Paris Exhibition and other places of interest in the neighbourhood. A detailed programme can be obtained of the secretary.

Electric Inclined Elevators.—We have received a letter from Messrs. Graham, Moreton & Co., of Leeds, stating that they have made and erected elevators similar in construction to the Reno inclined elevator described in our issue last week. It appears, however, that the elevators made by this firm have been used for conveying sacks and other goods, one of these, erected at Battersea, being capable of handling 1,000 sacks per hour.

Telegraphic Communication between London and Vienna.—Recently a member of the Austrian Chamber of Commerce petitioned the Minister of the Interior to use his influence in favour of the establishment of a third direct telegraph line between Vienna and London. The Minister has now replied that there is no immediate necessity for such a line, although some difficulties have been recently experienced with Anglo-Austrian telegraphic communications.

The Telegraph in German East Africa.—According to the Berlin correspondent of the *Standard*, preparations for laying the telegraph from Dar-es-Salam to Kilossa, in German East Africa, began about the middle of last month. The German Postmaster-General has promised to ask for 200,000 marks (about £10,000) in the next budget for carrying out the work, and he is reported to have stated that the telegraph must reach Ujiji before Mr. Rhodes' Cape-to-Cairo telegraphs.

Röntgen Society.—We have received a copy of the annual report for the year ended June 30 last. This useful society has now been in existence for three years, and during that time has greatly increased the number of its membership. During the past year no less than 62 ordinary members

Digitized by Google

have been added to its list. Dr. J. B. Macintyre, of Glasgow, has consented to be nominated as president for the next session.

London University Senate.—It is officially announced that the Faculty of Laws in the University of London having failed to exercise the power of appointing one member of the Senate by reason of there being no person entitled to be, Her Majesty has been pleased, by and with the advice of Her Privy Council, to appoint Baron Davey to be a member of the Senate. Her Majesty has also appointed as members of the Senate Sir John Wolfe Barry, Sir H. E. Roscoe, Mrs. Eleanor M. Sedgwick, and the Hon. W. P. Reeves.

New Treatment of Tuberculosis.—A Reuter's telegram states that in the International Congress of Medicine held at Paris, Dr. Labadi, delegate of the Medical Legal Society of New York, Dr. Bertheau, of Paris, and Dr. Ducamp, of Bordeaux, have reported on a new treatment of tuberculosis discovered by a Frenchman, M. Francisque Croth. This discovery consists in the direct transmission of antiseptics by means of static electricity. The most elaborate circumstantial statistics of the three physicians, covering a period of two years, agree in affirming that a high percentage of patients treated by this method have been cured.

Another Large Electric Power Scheme.—With reference to the note on page 615 of our issue last week, describing a projected electric power scheme, we are authoritatively informed that another large scheme for the supply of electric power for manufacturing, lighting, and other purposes throughout the industrial districts round Glasgow has been under preparation for some time past and is now completed. The scheme is being promoted by a number of influential engineers and others in the various localities within the proposed area of supply, and a bill for the necessary Parliamentary powers is to be introduced next session.

Telegraphic Communication with Pekin.—The Eastern Extension and Great Northern Telegraph Companies announce that they have received the following intimation from the Chinese Telegraph Administration: "Since despatches have come through safely at different times from Peking via Tsinanfu by couriers, attempts will now be made to forward on messages for Peking via same route at ordinary rate, plus $3 for courier service. Messages, however, will be subject to delay, and will only be accepted at sender's risk." The companies, therefore, propose to accept messages for Peking, subject to above conditions, at 6s. per message—in addition to the ordinary tariff of 5s. 6d. per word.

Locomotive Breakdown on the City and South London Railway.—As we go to press we learn that yesterday morning at about 9 o'clock a breakdown occurred on one of the trains between the Borough and Elephant stations on this railway. A short-circuit on one of the armatures resulted in the ignition of the insulation and a portion of the wood-work of the engine. Consequently the train came to a standstill in the tunnel until a spare engine could be sent up behind to push it into the Elephant station. The smoke appears to have incommoded the passengers in the train, which was rather crowded, but no injury was done to any passenger, nor, indeed, to the driver on the engine. There was only a slight delay of the traffic.

Appointment.—The Council of University College, London, have appointed Prof. G. Carey Foster, B.A., F.R.S., to be Principal of the College. Prof. Carey Foster is a Fellow of the College and has held the offices of Professor of Experimental Physics and of Quain Professor of Physics; he is also a Fellow of the University of London, in which university he acted as Examiner previous to his election to the Senate. Owing to this appointment and to the retirement of Mr. J. M. Horsburgh, the secretary of the College, there will be a reorganisation of the administrative and executive department of the College. Pending the completion of this reorganisation the Council have invited Dr. Gregory Foster, Fellow of the College and Professor of English Language and Literature at Bedford College, to temporarily hold the office of secretary, and he has accepted the invitation.

French Cables.—In the report of the French Cable Commission, referred to in our article on "French Cable Projects" last week, the length of some of the cables set out in tabular form was not given. By way of supplying the omission and rectifying errors which inadvertently occurred in our article, we give the table afresh with the correct estimated lengths inserted:—

Description of lines.		Cable length in marine miles.	Approximate cost.
Mediterranean System—*Oran-Tangier*		290	£32,000
Atlantic System.	*Brest-St. Louis* (or *Dakar*)	2,500	680,000
	St. Louis-Pernambuco (or *Cayenne*)	1,800	400,000
	Aerial line—*St. Louis to Kotonou*	1,700	40,000
	Kotonou-Libreville	660	96,000
	St. Louis-Libreville (direct)	2,040	720,000
Indian Ocean System.	Libreville-Madagascar	4,730	1,480,000
	Madagascar-Reunion	455	72,000
	Reunion-Indo-China	4,080	1,520,000
Indo-Chinese System—*Hue-Amoy*		1,000	220,000
		19,255	£5,260,000

The Electrical Engineers (R.E.) Volunteers at the Front.—We have received from Major R. S. Erskine a letter giving an extract from a report received from Major Crompton, dated Pretoria, July 17 and 18, showing where the officers, non-commissioned officers, and men of the corps were at work on those dates. Of the six who were taken prisoners, two escaped and the other four were released. Lieut. Pott is reported to be convalescent and to be returning home. Second-Lieut. Bigge, who was wounded, has returned to duty. Of those in hospital, Sapper Dalton is reported to be doing well, Sapper Arundel is convalescent, and owes his life to splendid nursing, Sapper Brander is convalescent. No information is given as to the condition of the others reported in hospital. The men have been at work: (1) As electrical engineers fitting up and repairing electric light and power plant; (2) search-light men; (3) arc-light men for working parties; (4) on telephone light lines; (5) as army telegraphists; (6) as railway telegraphists; (7) as Royal Engineers working parties on crib and tressel reconstruction, railway bridges; (8) as a fighting unit. Major Crompton reports that they have done well in each branch. He desires to be remembered to all the officers and the corps as a whole, and hopes that what has been done out in Africa will help the corps both as regards its prestige and future popularity, and he feels proud to have had command of such a thorough good lot of men.

Municipal Ownership in America.—Municipally owned electric light works in the United States seem to differ very much from those in this country, to judge by a leading article in the *Electrical Review* of New York, from which the following is quoted:—

Municipal ownership is a species of contagious infection which breaks out sporadically, much as the mumps and measles do in small towns and cities. The fever gets into the municipal blood and brain, and recovery is more or less rapid according to the violence of the attack. Those places that pass through the serious crisis of actually building a municipal plant recover slowly but very completely. Those that stop short of this acute phase are subject to recurring attacks. In the United States, the history of municipal electrical undertakings has been one long chapter of failure, and the features of each case have been practically identical. The place is a town of, say, 10,000 or 20,000 inhabitants. The municipal government is almost always thoroughly honest but highly inefficient. Some citizen suddenly discovers that if the electric light company makes a profit the municipality could get the same amount of light for less money. He talks in the town council and at public meetings, the newspapers take the matter up it becomes an issue in local politics. The question goes to a popular vote, and by an overwhelming majority it is determined to build a plant. All this time the agents of several contractors have been supplying data and figures to the committee or clique that is working for the plant. One of them secures the contract and the plant is built. Of course no engineer is employed, for by this time the committee in charge feels that it knows all about the lighting business and needs no advice. Generally the plant is well built, though frequently it is not. At the end of its first year of operation a balance-sheet is struck off, showing that street lighting is costing less than ever before. Nobody notices that such items as depreciation, remitted taxes, sinking fund for renewals, &c., are not charged on the balance-sheet. Soon it becomes necessary to find a berth for one of "the boys"—for some broken-down politician out of a job. A soft "snap" is found for him at the electric light plant. Then the politician anxious for re-election discovers that the wages paid by the plant are too low, and consequently wages are raised. And at the end of about five years the plant is for sale and the town council is advertising for bids for lighting and considering how large an increase of the tax rate the citizens will stand.

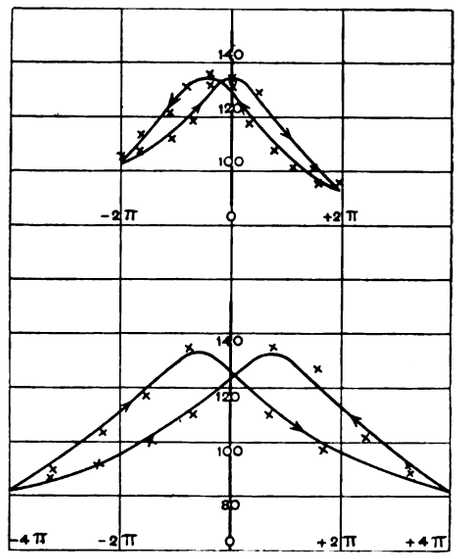
CONTEMPORARY ELECTRICAL SCIENCE.

[Compiled by E. E. Fournier d'Albe.]

Artificial Radio-activity.—One method by which light may be shed upon the origin of Becquerel rays consists in endeavouring to produce them in an ordinary body by some known process. This has been accomplished by P. Villard, who succeeded in rendering ordinary bismuth radio-active by subjecting it to the action of cathode rays in a vacuum tube. The best results are obtained by employing the metal as an anode and anti-cathode combined. Those parts upon which the cathode rays impinge in the greatest intensity are the most active. Success is also attained by making the bismuth the cathode. But, then, the region whence the cathode rays emerge becomes the least active. This is not surprising, since the rays emitted by radio-active bodies probably consist of negatively charged particles. Powdered bismuth and bismuth deposited by cathode rays can also be made radio-active by this process. The radio-activity obtained is very feeble, and inferior even to that of uranium. It is, however, sufficiently intense to verify the properties of the rays photographically, and to show that they are essentially the same as those of uranium. They are also very stable, and show no decrease within a month. It remains to compare this artificial radio-activity with the induced activity discovered by the Curies. In any case much of the mystery of these rays has been now solved.

[P. Villard, *Bull. Soc. Franç. de Phys.*, 152, 1900.]

Thermo-Electric Effect of Twisting.—When an iron wire is clamped in the middle and heated at the clamp, and one-half of it is twisted, an E.M.F. is generated which differs with the



angle of torsion. It is, however, not constant for a given torsion, but depends upon previous twistings. There is, in fact, a hysteresis of twist just as there is a hysteresis of magnetisation. The annexed curves, in which ordinates represent E.M.F.s and abscissæ twists, show this clearly. When mechanical disturbances take place their effect is to accelerate the process the metal happens to be undergoing. They raise the rising curve and lower the falling curve.

[K. Tsuruta, *Phil. Mag.*, August, 1900.]

Electrolytic Estimation of Bismuth.—Hitherto it has been found impossible to obtain, by the electrolysis of bismuth salts, a sufficiently adhesive deposit to permit washing and weighing. Usually an amorphous deposit of oxide is obtained which is useless for quantitative work. A great variety of plans have been tried, but the only successful one appears to be that devised by D. Balachovsky, who states the following as the essential conditions of success: Feeble acidity of the solution; absence of chlorine, bromine, or iodine in any large quantities; feeble current; and unpolished electrodes. The best salt to operate upon is the sulphate or nitrate (but not the chloride), dissolved in nitric acid, to which is added about six times its weight of urea. The maximum current is 0·06 amperes, the voltage 1·5, and the temperature 60deg. The analysis takes about six hours or eight hours. Much care must be taken to prevent the current density unduly increasing, as then the deposit immediately begins to oxidise. After washing and drying the precipitate is very stable. Instead of urea, formic or ethylic aldehyde may be added to the electrolyte. The part played by these additions is not yet clear, but when aldehyde is used the temperature has to be a little higher, and the current density a little lower.

[D. Balachowsky, *Comptes Rendus*, July 16, 1900.]

Motion through the Ether.—The greatest difficulty hitherto presented by the undulatory theory of light lies in the motion of ponderable bodies through infinite space occupied by an elastic solid. Lord Kelvin has approached this difficulty by a supposition which is at variance with the idea of the incompressibility of the ether, but which suggests a conceivable explanation of the difficulty, and throws some light on aberration and refraction. He supposes that each atom acts on the ether within it and around it "according to the old-fashioned eighteenth century idea of attraction and repulsion." Also that "the distribution of positive and negative density of the atom, and the law of compressibility of the ether, is such that the avevage density of the ether within the atom is equal to the undisturbed density of the ether outside." He then proceeds to investigate the probable distribution of the ether within the atom, and the stream-lines of the ether through the atom when the latter moves through the ether. He finds that a density of ether in the centre of the atom considerably greater than 100 times the density of undisturbed ether is required to make the refractivity as great as that of oxygen. A difficulty is offered by Michelson and Morley's proof that the atmosphere carries the ether along with it. But an escape is offered through the brilliant suggestion advanced independently by Fitzgerald and Lorentz that the motion of ether through matter may slightly alter its linear dimensions.

[Kelvin, *Phil. Mag.*, August, 1900.]

Magnetic Balance.—H. du Bois has improved the magnetic balance designed in 1890 for the Physikalisch-Technische Reichsanstalt so as to make it an instrument of precision, without reducing its practical convenience of manipulation. This task was facilitated by the proof brought by Taylor-Jones that Maxwell's law of magnetic attraction is valid over a wide range. Magnetic balancing is now superior to the ballistic method for most purposes. Superior results can only be obtained by the magnetometric study of ovoids, and these therefore offer a means of deciding doubtful cases. But such measurements are troublesome, and for ordinary purposes the accuracy to within 0·5 per cent. offered by the magnetic balance may be taken as sufficient. The normal sectional area of the specimen to be tested is 0·5 sq. cm. It may be fastened in two different ways, either by ordinary clamps, or, for more accurate work, between concave spherical contacts. The magnetic field is excited by two coils carrying a current of from 2 amperes to 5 amperes. The magnetic forces generated in the specimen are balanced against two running weights, moving along separate scales, one weight being 25 times the mass of the other. The ordinary length of specimens is 25cm., but for cases of brittle metals and alloys lengths as small as 6cm. may be employed. The author gives the mathematical theory of the instrument in full.

[H. du Bois, *Ann. der Physik*, No. 6, 1900.]

Electrical Plant for the Construction of the Dover National Harbour.—We understand that the contractors for the National Harbour at Dover have recently adopted some ingenious electrical machinery for carrying out the extensive and difficult constructive work at the new harbour. Among other purposes this machinery is employed in making the 40-ton concrete blocks used in the deep-sea work.

GLOUCESTER CORPORATION ELECTRICITY WORKS.

Amid all the *éclat* of gaily-decorated streets the municipal electric supply works of this historic city were opened on the 19th ult.

The electric lighting question first demanded the attention of the town by the notices given by four companies in June, 1889, of their intention to apply for provisional orders. It was then decided not to consent to any such applications, and meanwhile to consider the advisability of a municipal undertaking. No less than six companies between that time and 1895 gave similar notices, and in the latter year one company gave notice a second time, and the City of Gloucester Tramway Co. (Ltd.) made proposals for a combined scheme of lighting and traction.

After visiting the lighting and traction installations at Bristol, the Corporation decided, in November, 1895, to apply for their own order. In 1897 a special committee was appointed to advise the Council, and Mr. Hammond was asked to prepare a report dealing with the matter of electricity supply and the providing of a dust destructor. In August of that year it was decided to erect a station and destructor in combination, and after further visiting by a sub-committee, who embodied their experience in a report to the Council, a site on the Bearland estate was secured. The works are excellently situated in the south-west part of the city. They are easy of access and near the river, canal and dock branch railway. The station is practically on what was the south-west corner of the old Roman wall—a fact testified to by a stone built into the wall opposite the front entrance to the works, which bears the inscription: "While excavating for the foundation of the chimney-stack in May, 1899, this stone, which formed part of the old Roman wall of the city, was met with at 15ft. below the ground."

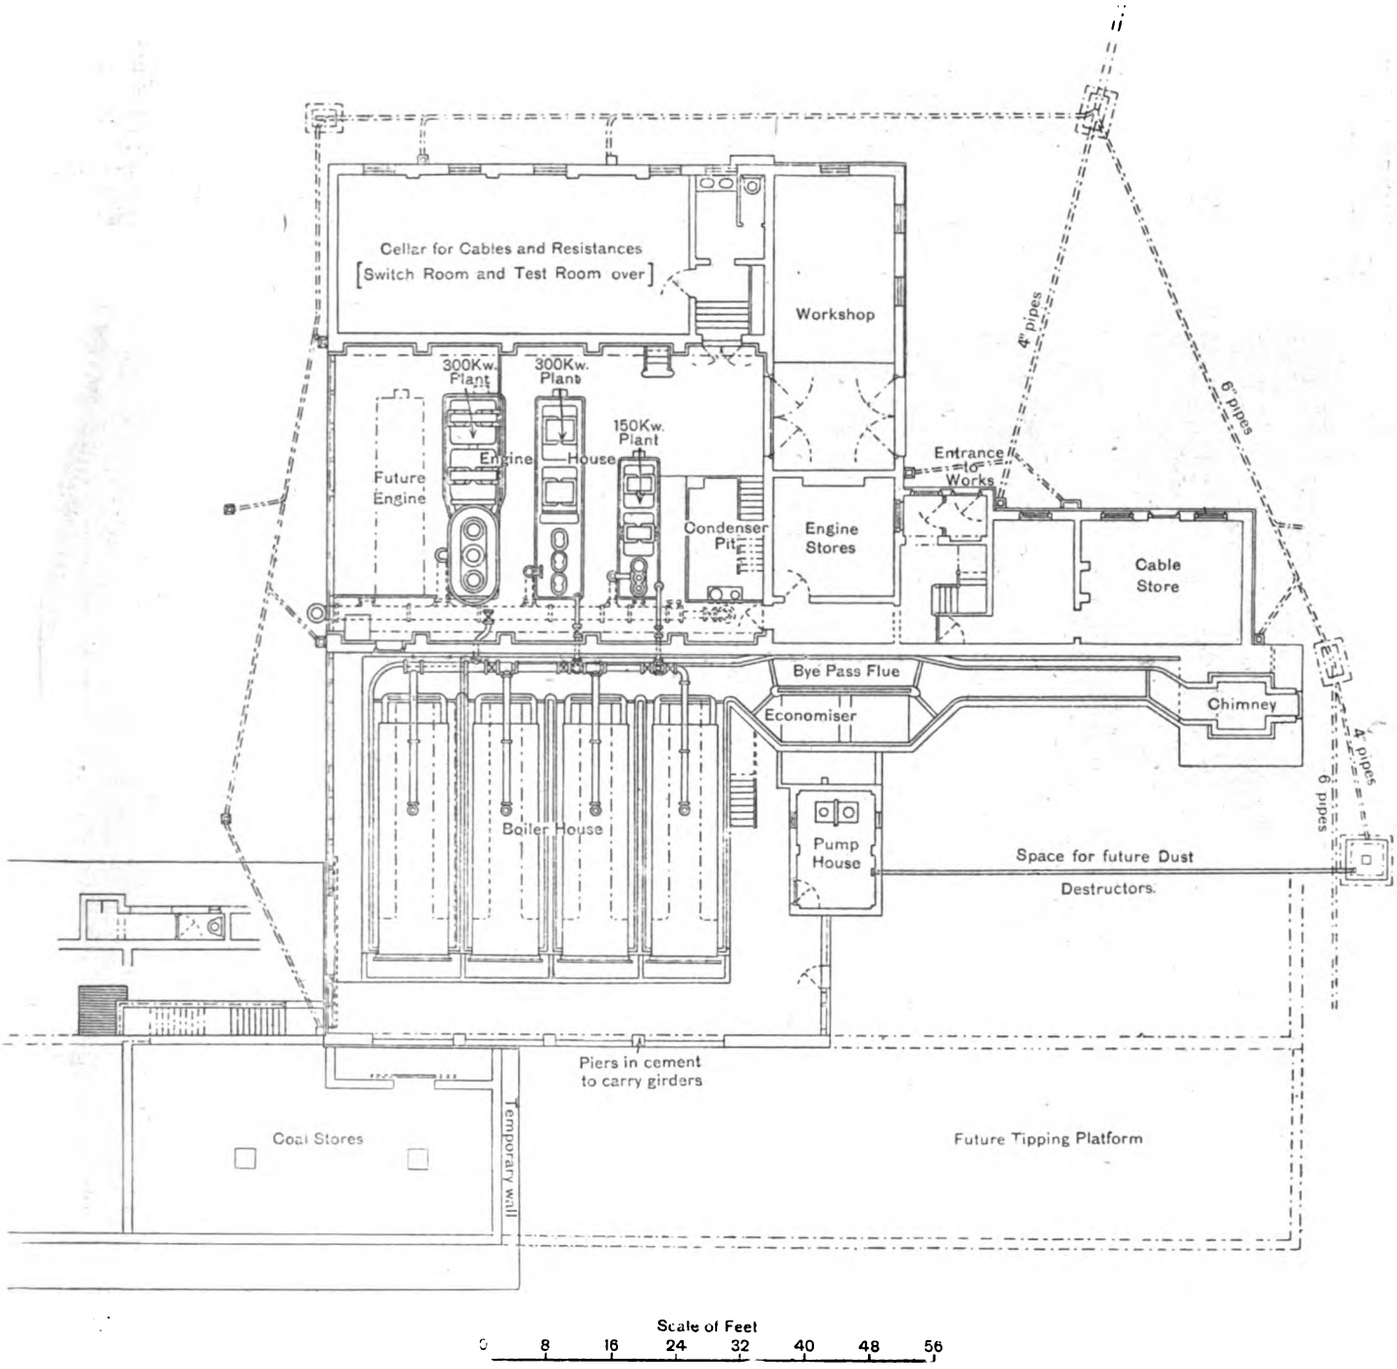

FIG. 1.—PLAN OF GLOUCESTER ELECTRICITY WORKS.

Digitized by Google

The natural disposition of the ground is remarkably well adapted to the requirements of a dust destructor, as it permits of a level roadway being run from Ladybellegate-street to the charging floor, which is 15ft. above the clinkering floor—the ground level of the present buildings.

The works approaches are from Commercial-road and Ladybellegate-street, and the buildings, which were erected by Messrs. John Gurney & Sons, to the designs of Mr. H. A. Dancey, of Gloucester, include an engine room 54ft. by 87ft. by 28ft. high, and a boiler house slightly larger.

The interior walls of the engine room are of buff bricks with a dado of brown glazed bricks. The general arrangement of the works may be gathered from the ground plan, Fig. 1. In the north-west corner of the engine room is the condenser pit, the floor of which is 12ft. below the engine room level. On the south side is the switch room, and immediately behind this the test room. The level of both these two latter rooms is 4ft. above that of the engine room floor. The office and stores accommodation is excellent.

At present the generating plant consists of two sets. The larger set is of a capacity of 300kw., and consists of a triple expansion Belliss engine, directly coupled to a pair of Silvertown dynamos each capable of generating 600 amperes at 250 volts, the speed being 350 revs. per min. Looking at the engine of this set broadside on, one of the three upper cylinders is the high-pressure one, and the two other adjacent to each other are intermediate—the steam being distributed between them. The three lower are the low-pressure cylinders. The high-pressure cylinder is 13in. diameter, the intermediate and the low pressure cylinders being all 17¼in. diameter.

Being coupled in series on either side of the neutral wire of the three-wire system employed, the set develops current at 440 volts to 500 volts at the station end of the feeders. The engine of the smaller set is a two-crank compound, with one high and one low-pressure cylinder working on cranks set at 180deg. angle apart. Steam is distributed by a single piston-valve between the cylinders and the engine speed is 380 rev. per min. At 180lb. pressure steam the I.H.P. of this engine is 250. To this engine are also coupled two Silvertown dynamos, but each of 75kw. capacity at about 220 volts pressure. The engines are fitted with a system of forced lubrication, oil being supplied to each bearing under pressure from a pump on the main shaft.

The remaining item of electrical machinery in the engine room is a 15kw. motor-generator. The motor, which has a capacity of 85 amperes, receives current from the 'bus bars at from 220 volts to 250 volts, and drives a dynamo capable of delivering a current of 100 amperes at from 20 volts to 150 volts, running at a speed of 780 revs. per min. All the dynamos and the motor are of the single horse-shoe under-type.

In the condenser pit already referred to, there are installed two Blake and Knowles jet condensing plants. Each of these is capable of dealing with 10,000lb. of steam per hour, and of maintaining a vacuum of 26in. Condensing water from the dock enters the condenser without any auxiliary pump besides the air-pump.

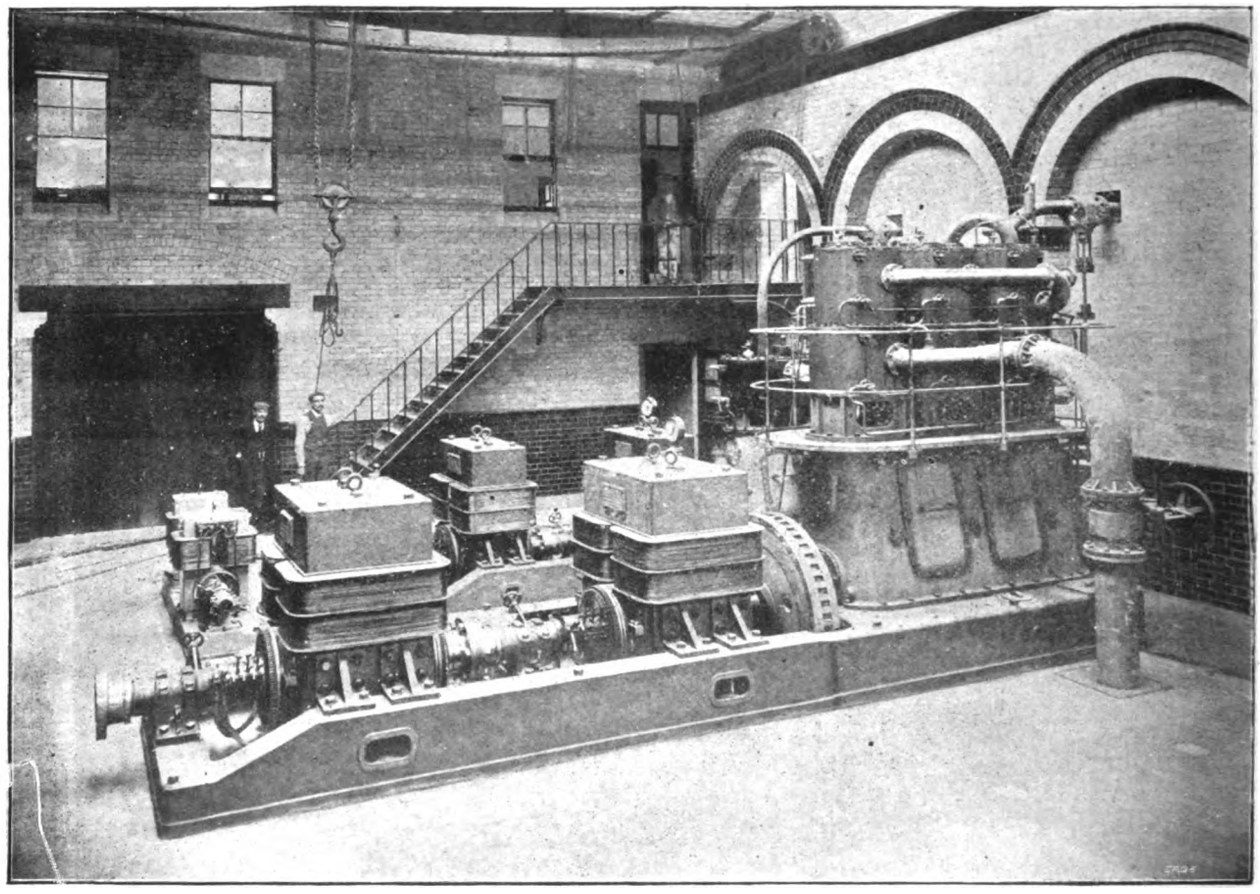

FIG. 2.—VIEW OF ENGINE ROOM, SHOWING GENERATING SETS AND MOTOR GENERATOR.

The exhaust main is 16in. diameter and of cast steel.

Spanning the engine-room is a 10-ton travelling crane by Messrs. J. Spencer & Co., of Manchester.

At present the boiler house contains three Lancashire boilers, each 30ft. long by 8ft. diameter, by Messrs. Yates and Thom. The evaporating capacity of each is 6,000lbs. steam per hour. They are throughout of steel, the shells being composed of seven rings, each made from one plate $\frac{3}{16}$in. thick. The working pressure is 160lb. per square inch. As may be seen from Fig. 3, which gives a view of the boiler-room looking toward the extension end, Proctor mechanical stokers are installed. These and the economiser scrapers are driven from a Bruce Peebles 5 H.P. shunt-wound motor, taking 20 amperes at 230 volts.

The feed arrangements include a double-acting ram pump by Evans, of Wolverhampton, with a Holden and Brooke injector

Digitized by Google

as a stand-by. The feed water can, at will, be delivered directly into the boilers, or alternately through a feed-heater and a Green economiser of 192 tubes. The feed-heater is heated by the exhausts of the auxiliary plant. It may be mentioned that the coal used at present is Forest slack, a steam jet blast being provided.

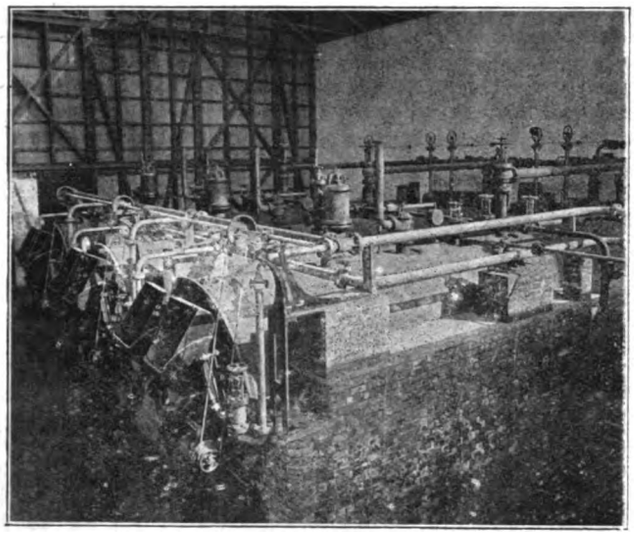

FIG. 3.—BOILER HOUSE.

All the main steam and feed pipes are of lap-welded steel by Messrs. Ashton, Frost & Co., of Blackburn. The boiler branches to the main steam pipe are 6in. diameter. The main steam pipe has a variable diameter, the maximum being 10in. From the main a 4in. pipe leads to an engine of the smaller set, and a 5in. pipe serves the large engine.

The minimum internal diameter of the chimney shaft is 6ft., the height being 150ft.

Leaving the steam plant and turning our attention to the switchboard, we were struck by the excellent arrangements in the cellar under the switchboard for bringing in the feeder and other cables. Fig. 4 gives a view in this room looking towards a sort of extended base of the actual switchboard in the room above. The trestle table shown in the figure is of slate slabs, and supports the feeders, &c., in their course from the outside wall to the meters. The whole arrangement is well lighted and get-at-able.

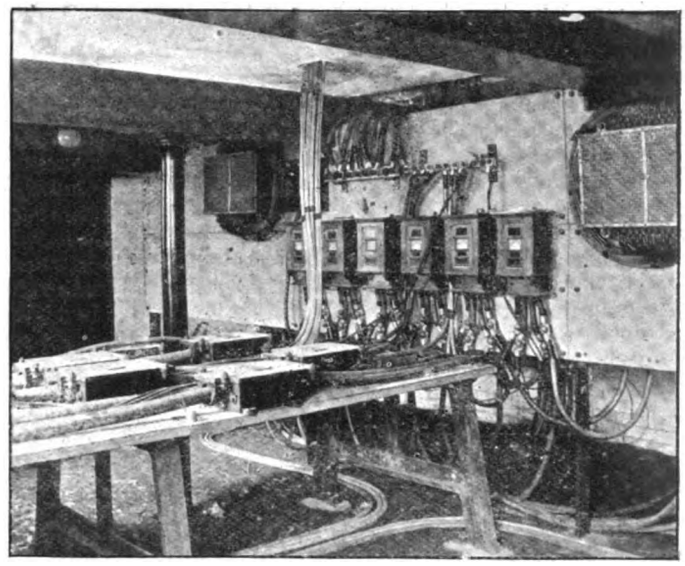

FIG. 4.—CELLAR UNDER SWITCHBOARD.

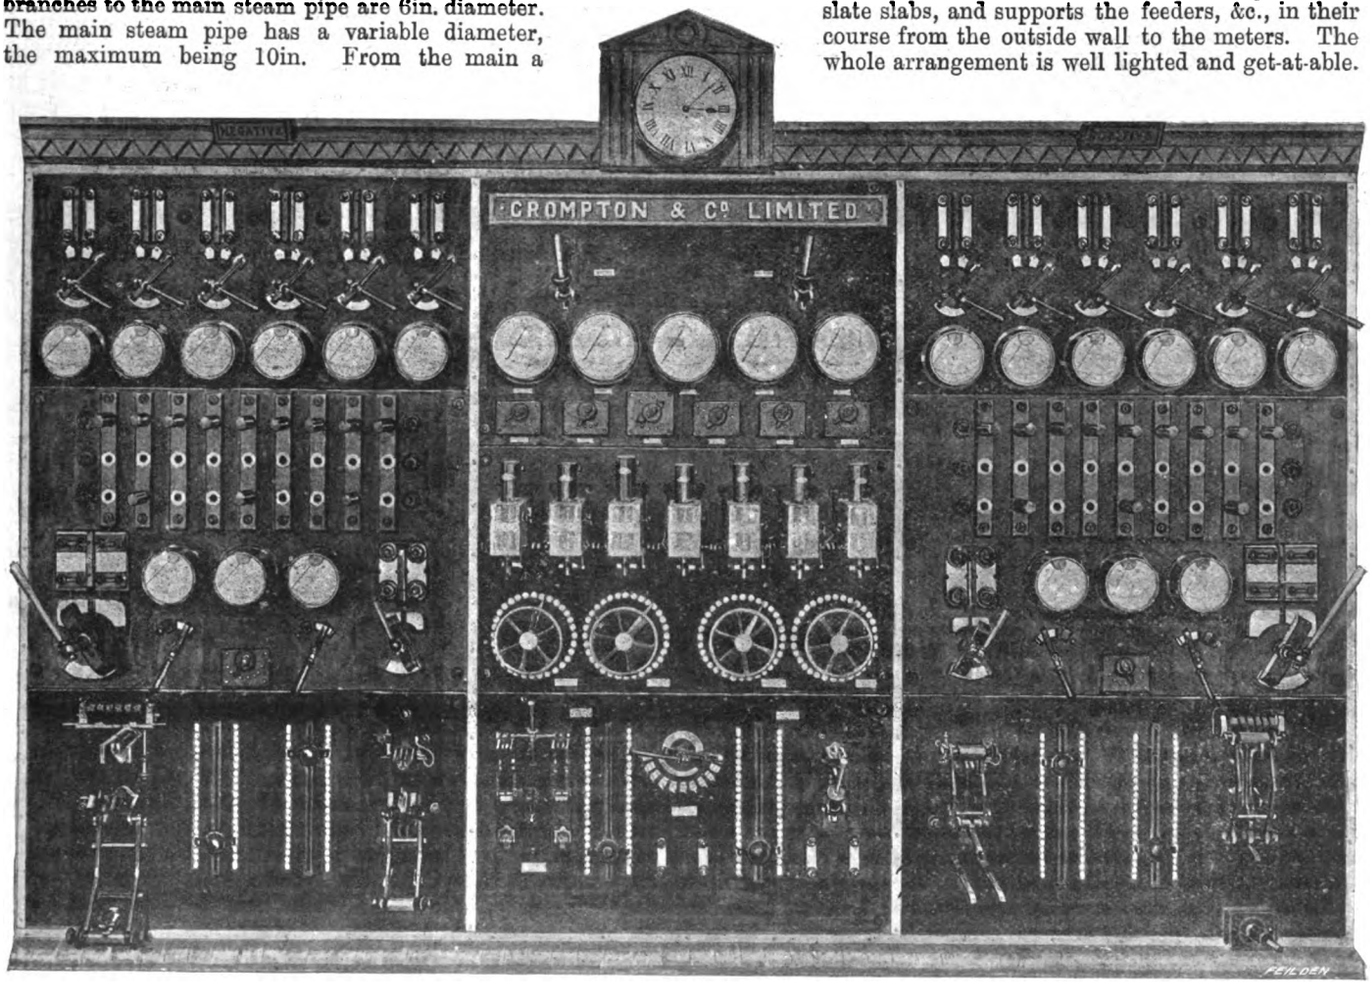

FIG. 5.—SWITCHBOARD.

Fig. 5 gives a view of the switchboard, which was built by Messrs. Crompton & Co., and Fig. 6 is a diagram of the connections. It will be noticed that the board is divided into three parts: A positive section on the right, the booster and

Digitized by Google

battery switches in the centre, and the negative section on the left. On the positive section are fixed two minimum automatic cutouts, shunt-regulating switches, and shunt-breaking switches for the dynamos, together with their duplex fuses and two-way switches. A Crompton shunted-type ammeter is in circuit with each dynamo, while a Crompton dead-beat voltmeter is common to the two machines. On the top of the board are the six sets of feeder-regulating devices, consisting of an ammeter, a two-way switch with quick-break action, and a duplex fuse.

The negative side of the board is symmetrical and similar in every respect. The centre panel contains the switches for operating the booster. Above are placed hand-wheels, which gear, by vertical screws, with the battery regulating switches in the battery room overhead. Each hand-wheel is surrounded by the numbers corresponding with the contacts on the battery switch, and the gear is such that for each complete turn of the wheel the battery switch is moved on to a new contact, the number of which is indicated by a pointer on the board.

poured in to surround the cable is further protected by cast-iron covers to the troughs.

The arc lighting cables are connected at suitable points to the distributing network, they are lead-sheathed and have 7/16 single conductors.

At present the total length of cable laid is as follows: Feeder cables 8¾ miles, pilot cables 8¾ miles, distributor cables 12½ miles, and public lamp cables 3¾ miles—a total of 23¾ miles

The battery room in the station is over the switchboard and test room. In it is installed 280 K.W.S. type cells by the E.P.S. Co. These are capable of maintaining a discharge of 80 amperes for 10 hours, or a maximum discharge rate of 216 amperes for three hours. Of the total number, a half, or 140, are on each side of the neutral wire and 60 on each side and adjacent to the neutral wire are regulator cells. These are switched in or out two at a time by the battery switch already referred to.

The arrangement of the regulating cells adjacent to the middle wire entails the employment of but one motor generator in place of the usual two boosters. The connections for this

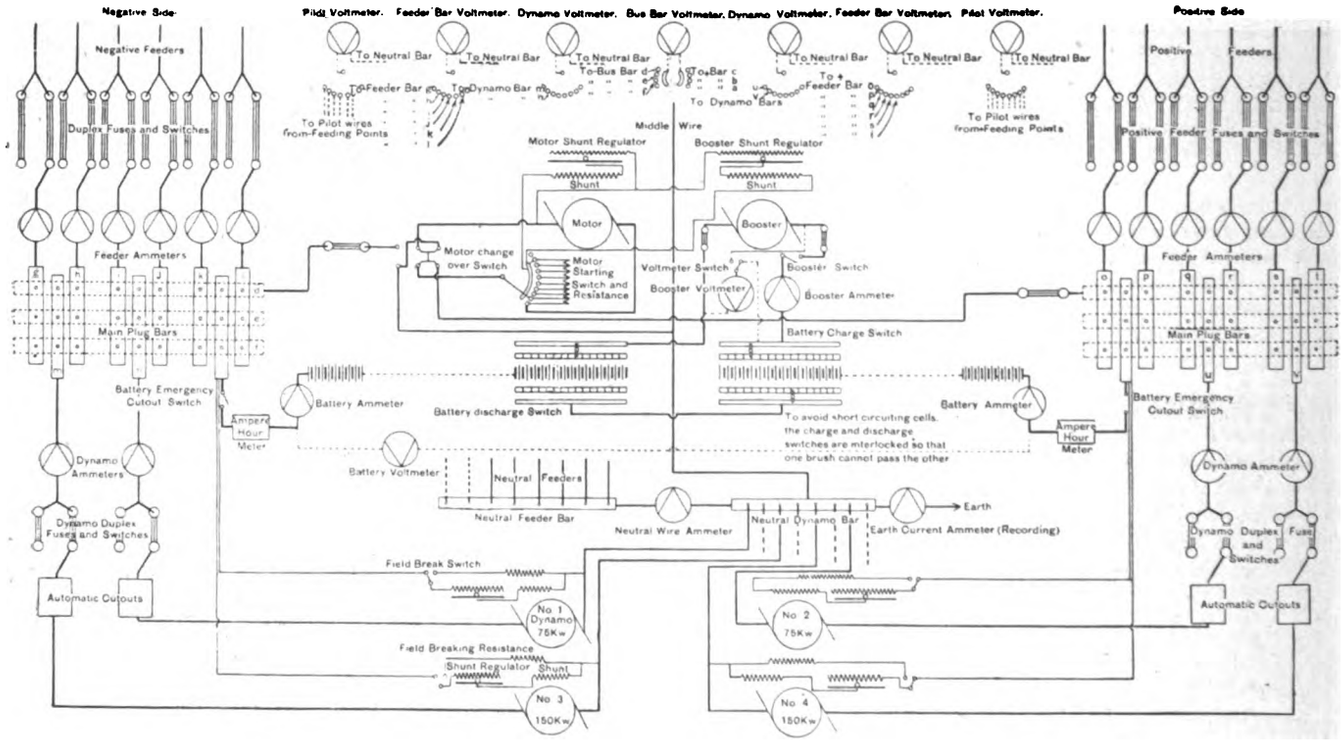

FIG. 6.—DIAGRAM OF SWITCHBOARD CONNECTIONS.

An automatic switch by Messrs. Crompton of the same design as their automatic cutout is so arranged in circuit with the earth connection of the middle wire that when the current to earth exceeds 10 amperes the earth-current ammeter is short-circuited, leaving a direct connection from the middle wire to earth. An interlocking arrangement prevents the re-interposing of the ammeter until the earth-current has again fallen below 10 amperes. The dynamos and booster are connected to the board by means of india-rubber lead-covered cables drawn into Doulton casing. Aron meters are included in the circuit of each feeder.

The private supply to the town is served by six feeders. These are triple-concentric, the neutral wire being the outermost. In five of these feeders the "outers" of the system are of 0·4 sq. in. section and the neutral 0·2 sq. in. The remaining feeder has conductors of 0·25 sq. in. section with a neutral wire of 0·125 sq. in. section. By the side of each feeder a three-core 7/20 pilot cable, lead-sheathed and armoured, is buried direct in the earth.

All the mains were supplied and laid by Callender's Co., and are on the "solid" system. The feeders and distributors being triple concentric, lead-sheathed, are supported on wooden bridges in cast-iron troughs. The bitumen then

are interesting, and are clearly seen in Fig. 6, in which the generator part of the motor generator is marked "booster" for simplification in lettering. Each cell contains 80 plates separated by glass tubes held in position at the top and bottom. The containing boxes are of wood, lead-lined, and the cells are supported on two-tier stands with iron standards and wood bearers. The weight of each cell, with acid, is approximately 435lb.

The battery is coupled up by ½in. copper rod run on insulators, which are suspended from the roof by iron straps.

The arc lighting is carried out by 44 Brockie-Pell single carbon open arc lamps. These are run in series of nine, there being four series of nine lamps each across the 440 volt-mains or "outers" of the three-wire system, and two series of four each across the 220 volt-mains. The arc columns are of the overhanging bracket type, and were supplied by Messrs. Hardy and Padmore, of Worcester. Each lamp is furnished with an automatic switch for inserting a substitutional resistance should the main circuit in the lamp be broken. Trimming and repair is facilitated by the lamps being lowered by a winch in the base of the pillars.

The refuse destructor has not yet been erected, but the contract is being executed by Messrs. Heenan and Froude, who

Digitized by Google

are to instal two pairs of their twin-cell destructors. The plant, having a capacity of 50 tons per 24 hours, will consist of two cells side by side, separated only from each other by a low bridge, like that of a boiler, so that open communication will exist between the cells. Each cell will have a charging door on one side of the furnace corresponding to a clinkering door on the opposite side, while the combustion chamber will be placed above the two cells extending their entire length. The boiler is installed above the combustion chamber. A hopper at each charging door will feed on to the grate bars, and the firemen can pull forward the refuse from the clinkering side or push it from the charging side. A fan will supply air blast to the grate and a steam blast by a jet. The main feature of the destructor is, we learn, that by altering the direction of a damper the gases from either grate can be alternately made to travel over the hot fire in the other grate before entering the combustion chamber, charging and clinkering taking place alternately, so that there is always a hot fire in one cell to consume completely the smoke and fumes from the other.

A water-tube boiler of 1,300ft. heating surface is to be erected over each of the two pairs of cells, thus supplementing the boiler of the generating station. As already mentioned, the level of the charging platform will correspond with that of Ladybellegate-street, consequently, the approach roadway for refuse will be level, and the portion of this roadway opposite the electricity works boiler-house will be partly of girder construction, so that space will be left below for coal storage and bunkers.

Owing to the fact that even before the works were completed the demand for supply had already exceeded the effective capacity of the original plant, it was necessary to think of extensions, and contracts were made as follows:—With Messrs. Tinkers for one Lancashire boiler 30ft. × 8ft. 6in. capable of evaporating 8,000lb. of water per hour, and to be fitted with Proctor's mechanical stokers, and for a 500 H.P. generating set with Messrs. Mather and Platt. This set consists of a Willans triple expansion central-valve engine, speed 320 revs. per min., coupled to two 150 kw. shunt-wound four-pole Mather and Platt dynamos. The switchboard will be extended by Messrs. Crompton, and another jet condenser, capable of condensing 10,000lb. of steam per hour, is being supplied by Ed. Chester & Co.

We understand that up to the present the capital expenditure has been £43,469. 10s. The tariff adopted is on the maximum demand system, with an initial price of 7d. per unit for the first 100 hours' use per quarter, at the rate of maximum demand, and thereafter 2d. per unit.

We have to express our thanks for the courtesy extended to us at Gloucester, and especially to Mr. Duesbury, the engineer-in-charge, for useful information necessary for this description.

THE RATHMINES ELECTRICITY SUPPLY STATION.

The small electric light works which are just approaching completion in Rathmines, near Dublin, have also been designed by Mr. Hammond, and follow almost the same lines as the Gloucester works. The Urban District Council of Rathmines and Rathgar obtained its provisional order in 1896 but did not bestir itself to erect electric light works until the various schemes for the aggrandisement of Dublin and its electricity supply system began to take shape, when it became most anxious to have electric light in the district supplied from works of its own.

Although the supply system is similar to that of Gloucester the contractors are different. There are only two generating sets, each with the two 220-volt dynamos for the three-wire system directly coupled at the same end of the engine. The larger set is a three-crank, triple-expansion engine, driving two 150kw. dynamos, and the smaller one a two-crank compound engine driving two 75kw. dynamos. The steam pressure is 150lb. per square inch. The machines are all four polar, and of Messrs. Mather and Platt's usual construction for machines of this small size. The larger engine indicates 575 H.P. at its maximum load when running at 320 revs. per min., and the cylinder diameters are 720mm., 480mm., and 320mm., the stroke being 260mm. The engine is on a combination bedplate, which takes the two dynamos. The smaller engine indicates 240 H.P. when running at 360 revs. per min. The cylinder diameters are 600mm. and 36mm. by 200mm. stroke, and the combination bedplate is similar to that of the larger machine. As two dynamos are used on each set, no balancing transformer is required, and the only auxiliary generator is a booster, or rather a motor generator for charging the middle cells of the battery, with the same connections as at Gloucester. There are 274 cells of the Tudor type, of which 50 on each side are for regulating, the cell switch having 30 steps. The capacity of these cells is 800-ampere hours for a 10-hour discharge or 650 ampere-hours for a 3½-hour discharge, and they are designed for a maximum discharge rate of 216 amperes.

In the engine room is a 10-ton travelling crane made by Messrs. Higginbottom and Mannock. Its span is 35ft. 6in., and it has rivetted girders and under carriages, and steel wheels throughout. All the motions are worked from the crab on the platform above.

In the boiler-house are three Lancashire boilers by Messrs. Taylor & Sons, 30ft. by 8ft., each capable of developing 7,000lb. of steam per hour at 160lb. per square inch pressure. They are fitted with Vicars' stokers, and work in conjunction with a 96-tube Green economiser, whose scrapers, as also the stoker gear, are driven by a 6 H.P. Crompton motor. The boilers are fed by a three-throw single-acting Blake and Knowles feed pump driven by a Lundell motor, and in addition there is a 4in. by 6in. double ram flywheel steam pump made by Messrs. J. Green & Sons. The boilers are also fitted with injectors. A 30in. jet condenser, made by the Wheeler Condenser and Engineering Co., is employed working with one of the same firm's horizontal wet and dry vacuum pumps, the dimensions of which are 14in. steam cylinder, 16in. wet vacuum cylinder, 16in. dry vacuum cylinder, and 16in. stroke. This is a combined plant arranged so that the dry vacuum cylinder creates the vacuum while the wet vacuum cylinder handles the circulating water and pumps the latter to the top of the cooling tower. This latter is of the Klein standard "chimney" type with natural draught. It consists of a rectangular chimney about 60ft. high, constructed on a substantial pitch pine framing. The cooling stack is placed in the base of the tower and the water is pumped to a height of about 25ft. In the design of the tower every effort has been made to give an uniform distribution of water in thin films over a large surface, and at the same time to allow of a sufficient current of air between the surfaces to carry off the vapour. Town water is used both for the condensers and feed.

The switchboard has been supplied by Messrs. James White, and is made up of enamelled slate slabs mounted on a steel framework. Over the board is an ornamental iron frame and electric clock. The board itself is in three parts: The negative dynamo and feeder panels to the left, the positive to the right, and in the middle is the battery balancer and middle wire connections. In the circuit of each dynamo is a Ferguson & White aluminium automatic cutout, a Kelvin square pattern ampere gauge and a duplex fuse and switch connecting on to the dynamo bar in front of the board. Each feeder has also a duplex fuse and switch connecting on to the feeder bars likewise in front of the board, and there is a Kelvin edgewise ampere gauge in series with each feeder. The field regulating switch of the dynamos works as usual by a handwheel. On each positive and negative panel is provided a Kelvin paralleling voltmeter for the dynamos, and at the top of the middle panel are two edgewise ampere gauges for the middle wire current and earth connection current respectively, and also a Kelvin earth current recorder and an automatic short-circuiting switch. The recorder is not mounted on the switchboard itself, but on the wall close by. The 'bus bar and feeder voltmeters are of the Kelvin multicellular type. The battery regulator itself is placed in the middle of the battery room, and is connected by chain gearing and shafting to handwheels on the switchboard, the gearing and shafting running through a tunnel specially provided for the purpose. All the connections between the regulator and regulating cells

Digitized by Google

are of bare copper rod coated with anti-sulphuric enamel and carried on porcelain insulators. An Aron three-wire watt-hour meter is fitted on each feeder in a recess under the switchboard.

The mains are all of the triple concentric lead-covered type, laid in cast-iron troughs and filled in solid with bitumen. The distributing network consists of 0·1 sq. in. and 0·05 sq. in. cable, and embraces all the principal streets, the total length of distributing cable laid to the present amounting to about 16 miles, and the district, which is practically the residential part of Dublin, covering 2½ sq. miles. The outer conductor of the triple concentric is the neutral wire. The network is fed at seven points by 0·4 sq. in. and 0·3 sq. in. feeders laid with their respective pilot wires in troughs. Four-way and three way disconnecting boxes are provided at about 40 points in the network. They are arranged in brick pits, fitted with easily removable covers so that any section of the network can be cut out without difficulty. The house services and the services to the street incandescent lamps are made by means of cast-iron boxes filled with insulating compound, the services to the lamps terminating in earthenware end connections. The present scheme of incandescent street lighting includes 225 posts on each of which is a bracket holding two 16 c.p. lamps. In addition to the cable mentioned above, there is about 9 miles of 7/16 single lead-covered cable for supplying 108 10-ampere arc lamps which are arranged in 12 circuits of nine each. This cable is laid in B.I.W. earthenware troughing filled in solid with bitumen, the branches to the lamps ending in porcelain end-connections. The arc lamps are of Messrs. Crompton's make, and no trouble is anticipated in running the lamps nine in series, this having worked quite successfully with Crompton lamps at Canterbury, where, however, each section is brought back to the station. Each arc lamp has a turn-over switch and also an automatic cutout for inserting the substitutional resistance. They are lowering lamps with contacts in the hoods. The incandescent lamps are arranged on the ordinary distributing network, and therefore require the services of a lamplighter.

The total amount of loan sanctioned by the Local Government Board for the 450kw. plant is £71,000, distributed as follows :—

Buildings, foundations and chimney shaft	£8,000
Generating works	17,668
Mains	33,092
Public lighting	7,360
General charges and engineering fees	4,880
	£71,000

The resident engineer is Mr. G. F. Pilditch.

ELECTRICITY WORKS ACCOUNTS.

Huddersfield Municipal Electric Supply Works.

As will be seen from our first table this week the accounts of the Huddersfield undertaking for 1899 indicate remarkably good results in every essential respect. Last year's output, at 951,033 units sold, marks an advance of no less than 60·8 per cent. on the business of 1898. Not only in amount, however, but in character, the load on the station shows a great improvement. In 1898 the load factor was 8·8 per cent. During the last year this factor had risen to 10·7 per cent.

Naturally, these altered conditions were not without their due influence upon the costs, but to have effected a reduction in the fuel item as well as in the other generating costs is a most commendable result in view of the excellent 1898 figures and of the prices ruling in the coal trade. As they stand, the works costs are but little more than half what they might reasonably have been under the conditions of output and load which prevailed during the year. The increase in the lamp connections was nearly 30 per cent.

Year ended Dec. 31.	No. of con-s'mers.	No. of 8 c.p. lamps con-nected	Out-put : units sold.	Gross sur-plus.	Appropriation of surplus.			Met by the boro' fund.	Carr'd to dep. preciation & c'tingencies

* 17 months.

Stafford Municipal Electric Supply Works.

It was by no means to be expected that Stafford could have kept the figure for the fuel cost at the low value which secured for the undertaking the record in this respect for the year 1898-9. The result of the working during the last financial year is a fuel charge which indicates but slight retrogression and which is practically a repetition of the figure attained in 1897-8—also a record for that year.

Unfortunately the increase in this item and other items of generating costs, especially repairs and maintenance, has had the effect of discounting materially the lower station wages, distribution, public lighting and management charges, which have all been reduced, and with the exception of wages at the station show most excellent figures. However, the total costs exhibit a decided reduction and stand at a very satisfactory value considering the low load factor of only 8·54 per cent.

So far as the increase of business is concerned, the undertaking made much greater progress last year than previously, in that the output advanced by nearly 28 per cent. and the lamp connections by 16·5 per cent. While the working profit shows a marked advance the undertaking has not yet attained a self-sustaining stage; the year's operations resulting in a deficit of £375, as compared with £514 in the preceding year.

This is, of course, a decided improvement in view of the material reduction in the already moderate average price obtained per unit.

The following is a list of electric supply works the accounts of which have been analysed, together with the dates on which statements and analyses of accounts have appeared:—

Aberdeen (Municipal)	Jan. 12, 1900	Kingston-on-Thames (Mun.)	July 20, 1900

The Electrician.

The Oldest Electrical Journal (established as a weekly Journal 1861—1878

Published every Friday, Price Sixpence; Post Free, Sixpence-Halfpenny.
Editorial Publishing and Printing Offices,

1, 2 & 3, SALISBURY COURT, FLEET ST., LONDON.

Telephone: 949 Holborn. *Telegrams:* "Electrician Newspaper London."

All Letters relating to Subscriptions, Advertisements, and other business matters should be addressed to the Publisher "The Electrician," *Salisbury-court, Fleet-street, London, E.C. Cheques and Money Orders should be made payable to* "The Electrician" *Printing and Publishing Company, Limited, and be crossed* "*Coutts and Co.*"

All Editorial letters to be addressed to The Editor.

All letters for insertion in "The Electrician," *or containing questions, must be accompanied by the name and address of the writer as evidence of good faith. No notice whatever is taken of anonymous communications.*

"The Electrician" *is published every Friday morning, in time for the morning mails. It is on sale at the railway bookstalls throughout the Kingdom on Friday morning, and can be obtained of all Booksellers and Newsvendors; or direct from the Publishing Offices, as above*

Subscription Rates.—The Rates for Subscriptions to "The Electrician" are as under:—

	Year	Half-Year	Quarter	
United Kingdom	26s. 0d.	13s. 6d.	7s. 0d.	Post free, payable in advance.
Postal Union	30s. 0d.	16s. 0d.	8s. 0d.	

New Volumes of "The Electrician" *commence in April and October.*

"The Electrician" *offers exceptional advantages to Advertisers.* **It has by far the largest circulation of any English Electrical paper, and circulates all over the World.** *This statement is guaranteed.*

Advertisement Rates, &c., forwarded on application to the Publisher.

Trade Advertisements *intended for the current issue must reach the Office not later than First Post on Thursday. Renewals of expiring advertisement orders and alterations to standing advertisements must be in Publisher's hands by Wednesday. Wrapper Advertisements by Wednesday morning.*

Official Announcements, Auctions, *and* Small Advertisements *accepted up to 6 p.m. on Thursday.*

ELECTRICAL BOOKS AND PUBLICATIONS.

All Books, Newspapers, and other publications can be ordered direct of The Electrician" *Printing and Publishing Company, Limited. The well-known* "Electrician" Series *of Standard Electrical Works at present consists of—*

ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS. By J. Elton Young, M.I.E.E. Price 10s. 6d., post free; abroad 11s.

THE STUDENTS' GUIDE TO SUBMARINE CABLE TESTING. By Messrs. H. K. C. Fisher and J. C. H. Darby. Price 6s. net; abroad, 6s. 3d.

BIBLIOGRAPHY OF X-RAY LITERATURE AND RESEARCH. Edited by C. E. S. Phillips. With an introduction on the history of Crookes Tube and Röntgen Ray work, and a chapter giving "Practical Hints" on the subject.

THE POTENTIOMETER AND ITS ADJUNCTS. By W. C. Fisher. Price 6s., post free.

LOCALISATION OF FAULTS IN ELECTRIC LIGHT MAINS. By F. C. Raphael. Price 5s., post free.

MOTIVE POWER AND GEARING. By E. Tremlett Carter. Price 12s. 6d., post free.

SUBMARINE CABLE LAYING AND REPAIRING. By H. D. Wilkinson. Price 12s. 6d., post free.

ELECTRICAL LABORATORY NOTES AND FORMS (Elementary and Advanced). Arranged by Dr. J. A. Fleming, M.A., F.R.S. Printed particulars on application.

ELECTROMAGNETIC THEORY. By Oliver Heaviside. Vol. I. Price 12s. 6d., post free 13s. Vol. II. Price 12s. 6d.; post free, 13s.

THE ALTERNATE CURRENT TRANSFORMER IN THEORY AND PRACTICE. By Dr. J. A. Fleming. VOL. I.—THE INDUCTION OF ELECTRIC CURRENTS. New Edition. Price 12s. 6d., post free. VOL. II.—THE UTILISATION OF INDUCED CURRENTS. Price 12s. 6d., post free.

ELECTRIC LAMPS AND ELECTRIC LIGHTING. By Prof. J. A. Fleming, M.A., D.Sc., F.R.S. New Edition. 93 original illustrations, price 6s.

MAGNETIC INDUCTION IN IRON AND OTHER METALS. By Prof. J. A. Ewing, M.A. New edition. Price 10s. 6d., post free; abroad 11s.

ELECTRIC MOTIVE POWER. By A. T. Snell. 10s. 6d. post free.

THE ART OF ELECTROLYTIC SEPARATION OF METALS (Theoretical and Practical). By Dr. George Gore. Price 10s. 6d.; post free.

ELECTRO-CHEMISTRY. By Dr. George Gore. Price 2s., post free.

PRACTICAL NOTES FOR ELECTRICAL STUDENTS. By A. E. Kennelly and H. D. Wilkinson. Price 6s. 6d., post free.

DRUM ARMATURES AND COMMUTATORS (Theory and Practice). By F. M. Weymouth. Price 7s. 6d. post free.

THE INCANDESCENT LAMP AND ITS MANUFACTURE. By Gilbert S. Ram. Price 7s. 6d., post free.

A POCKET BOOK OF ELECTRICAL ENGINEERING FORMULÆ. By W. Gnipel and H. M. Kilgour. Price 7s. 6d. net, post free 7s. 9d., abroad 8s.; large-paper edition, 12s. 6d., post free. New edition in the press.

"THE ELECTRICIAN" PRIMERS. In Two Vols. Paper covers, 2s., post free 2s. 2d. each; strong cloth 2s. 6d., post free 2s. 9d. each. Single Primers 2d., post free 2½d.

WIRELESS TELEGRAPHY: Signalling across Space without Wires by Electric Waves. By Dr. O. J. Lodge. New Edition. Price 5s. net.

A DIGEST OF THE LAW OF ELECTRIC LIGHTING, ELECTRIC TRACTION, TELEGRAPHS, TELEPHONES, &c. A. C. Curtis-Hayward, B.A. To January, 1900. Price 3s. 6d., post free.

CARBON MAKING FOR ALL ELECTRICAL PURPOSES. By Francis Jehl. Price 10s. 6d., post free.

THE MANUFACTURE OF ELECTRIC LIGHT CARBONS. A Practical Guide to the Establishment of a Carbon Manufactory. Price 1s. 6d., post free.

THE STEAM ENGINE INDICATOR AND INDICATOR DIAGRAMS. Edited by W. W. Beaumont. Price 3s. 6d., post free.

FULL CATALOGUE POST FREE ON APPLICATION.

"ELECTRICIAN" SERIES FORTHCOMING BOOKS.

THE ELECTRIC ARC.—By Mrs. Ayrton. This work is in the press, and will contain an historical sketch of the early experiments on the electric arc, as well as the important results of recent research.

PRIMARY BATTERIES.—A work on this subject will shortly be published bringing the theory and practice of the Primary Battery up to date. The book will be fully illustrated.

SECONDARY BATTERIES.—By E. J. Wade. Fully illustrated. The Author in this work will deal briefly with the theory and fully with the chemistry, design, construction and manufacture of secondary batteries or accumulators.

"THE ELECTRICIAN" WIREMAN'S POCKET-BOOK.—Edited by F. C. Raphael. "The Electrician" Company will shortly publish a valuable pocket-book for the use of those engaged in wiring work, both external and internal.

THE TELEPHONE.—By Dane Sinclair and F. C. Raphael.

SPECIAL NOTICES.

NOW READY.—Vol. XLIV. of **"The Electrician"** (960 pages), bound in strong cloth. Price 17s. 6d., post free 18s. 6d. Also ready, Cases for binding. Price 2s., by post 2s. 3d.

A complete set of "The Electrician" (1878-1900) can now be supplied. These sets are very scarce, and early application should be made.

NOW READY.—**"THE ELECTRICIAN" READING CASE.** Holds four copies of the Journal. Strongly made and corded for hanging. Price 1s.; post free, 1s. 4d.

EARTHING THE MIDDLE WIRE.

Before the Board of Trade permitted the earthing of the middle wire of a three-wire system, many supply station engineers considered that this simple connection would be a panacea for all their troubles. There would be no more leakage, no more danger from fire, no more electrolysis, no more trouble from consumers' bad wiring, and no more testing of mains. Now that the Board of Trade, instead of prohibiting this earthing of the middle wire, insists on it, except in connection with a few older networks, there is no longer such enthusiasm on this point; the advantages of the rule are taken in a matter-of-fact way, and the best that can be said is that there is no grumbling. The only persons who have all along warmly welcomed the earthed middle wire, as a step towards a bare middle wire both in the streets and on consumers' premises, have been those interested in special systems of wiring, the introduction of which has been delayed by the necessity of insulating both conductors. Mr. Wordingham, who, with the five-wire system at Manchester, has probably had longer experience than anyone else with networks with an earthed middle wire, gives as his opinion, in the Paper we publish this week, that the only consideration which makes this practice desirable is "that it admits of all three conductors being brought into a consumer's premises, thus enabling every installation to be balanced within itself." Since the revision of the Board of Trade Regulations in 1896, Mr. Wordingham has been extending the Manchester network on the three-wire system only, with 400 volts between the outers, instead of the same pressure between the outers of the five wires, and we must presume that he has been following the practice he alludes to of bringing all three wires into the consumer's premises. As Mr. Wordingham can only have been doing this with the knowledge of the Board of Trade, it appears that the common interpretation of Regulation A (1) is incorrect. This regulation reads: "The pressure of a supply delivered to any consumer shall not exceed 250 volts at any pair of terminals, except with the express approval of the Board of Trade. Such approval will only be given for special purposes, and on the joint application

Digitized by Google

of the consumer and the undertakers, and the supply will be subject to such further regulations as the Board of Trade may from time to time prescribe." Consequently we must take it that, by employing two distinct pairs of terminals, 500 volts pressure may be introduced in a house. This is certainly an important advantage, as it enables all large consumers to be wired on the three-wire system, even when the declared pressure is 240 volts, and thus assists considerably in balancing the two sides of the network. It is not quite clear to what extent the supply station engineer is legally justified in compelling the consumer to wire on two independent circuits for connecting to the three-wire systems, for he is compelled to supply any consumer who demands it with a "reasonable" maximum power. The meaning attached to this word "reasonable" therefore governs the situation, modified perhaps by the right which the undertaker possesses to cut off supply if the consumer uses it in such a way as to interfere improperly with the supply to others. At Manchester, Mr. WORDINGHAM will not supply a consumer with more than 2½kw. from one pair of terminals, but Manchester is in a different position from most other supply undertakings in having Parliamentary powers to enforce wiring rules. The majority of other undertakers put the limit at about 5kw., but some approach closely to the low maximum laid down at Manchester, and it would be interesting to know what would be the result if a consumer in the compulsory area supplied by one of these undertakers refused to go to the expense of wiring from two pairs of terminals for a maximum demand of 3kw. or 4kw.

But to return to the main question of earthing the middle wire. There are other advantages which are obtained by this practice, the most notable one being the increased security of house-wiring, both as regards shock and safety from fire, and we should not be surprised if the result were soon the rehabilitation of the practice of placing fuses on one pole only (the pole which is not earthed, of course), in spite of wiring rules and fire office inspectors. We are surprised also that Mr. WORDINGHAM does not attach more importance to the fact that an earthed middle wire accelerates the burning-out of faults with the minimum of damage to the remainder of the network, for on one occasion he is reported to have said that he preferred to employ 3,000 H.P. or 4,000 H.P. for localising these troubles unaided by more scientific methods. For this reason the first of the two disadvantages enumerated in the Paper, to earthing the middle wire is not generally serious, for if a bad leak occurs it is surely best that it should be burnt down to a dead earth as soon as possible, and then isolated by the blowing of the fuses in the service or network boxes as the case may be. Where, however, this consideration does become really serious is in the case of overhead wires, bare-strip systems, and rubber cable. With overhead distributing systems we have, as yet, little to do in this country, and it is doubtful whether on such networks it would be desirable to earth one pole. Bare-strip systems on insulators have given considerable trouble by the deterioration in the insulation of the negative conductor mentioned in the Paper, which is increased if the negative is prevented from assuming zero potential by the earthing of the neutral wire. However, bare-strip systems are in the minority, and those recently erected have been constructed in such a way that the insulators are easy of access for inspection. With regard to the behaviour of rubber cable, however, Mr. WORDINGHAM has given us some new facts in his Paper. It appears that this same creeping effect, which has long been known to be disastrous to the insulation of the negative pole of bare-strip mains, actually extends to the rubber insulation of the negative cables, which therefore continues to absorb water, at a rate following a sort of compound interest law, until the cable becomes unusable. But nowadays indiarubber-covered mains are chiefly employed in special circumstances and with special precautions, and the effect of this osmotic action on house-wiring is probably only important in damp situations, where specially protected fittings and special wiring systems or lead-covered cable should be employed.

Taking all things into consideration, therefore, we go further than Mr. WORDINGHAM, and consider that it would be advisable to earth the middle conductor of a three-wire system even if this did not make it allowable in all instances to bring the three wires into consumers' houses. We now come to the questions whether the earthing should be at one or more points, and whether it should be removable. These two questions hang together, for the more points there are at which the earth connection is made, the more difficult it is to remove it, and, in fact, in the case of house-wiring with one conductor bare removal of the earth connection becomes impossible. Mr. WORDINGHAM gives very good reasons for having the earth only at the generating station and for arranging it in such a way as to facilitate its removal for testing purposes, or in the event of a serious leakage to earth on one of the other poles of the network. He states his case so ably that the advocates of bare-return house-wiring will have to argue well to prove that their systems are suitable for large supply networks. It must be remembered that a slight cheapening of house-wiring and perhaps a slight added increment of safety will not compensate for introducing a risk of injury to the constancy of the supply. The earthing of all the feeding points has much to recommend it, especially on smaller networks, as a compromise between bare conductors and a single earth connection, but, as Mr. TROTTER pointed out in the discussion on Mr. WORDINGHAM'S Paper, it renders the testing of the network more complicated and makes it impossible to cut off the earth connection at short notice to meet an emergency. It is to be regretted that Mr. TROTTER'S other two suggestions were not discussed—viz., that it might be advantageous to add a resistance between the middle wire and the earth connection, and that the advisability of keeping the lead 2 volts or 4 volts negative to the middle 'bus bar was worthy of consideration.

ELECTROMAGNETIC THEORY.—CXVII.*

BY OLIVER HEAVISIDE.

(*Continued from page 445.*)

§ 469. The last result brings us back to the simple theory of pairs of inclined terminated plane waves. It was, in the first place, from the theory of generation of a single complete plane wave that we concluded that a straight line of curl of e of strength f generated induction at the rate f. This property has now been applied to the wave generated by a plane sheet of f continuously growing at one of its straight edges, thus introducing new filaments of f, both when $u < v$ and when $u > v$. The first case includes, for a steadily moving state, the theory of Vol. I., § 166. The second case is much simpler in results. The H can be determined from the first moment of starting the action of f, including the initial partially cylindrical cap. Behind this cap H soon becomes constant, equation (40). This signifies slanting divergent plane waves. For, by taking differences, we can derive the H due to a plane strip of f of constant width started and set in motion at any moment in its own plane at speed u. Except as regards the cap, or rather, with the addition of the cap, we get a pair

* All rights are reserved.

Digitized by Google

of diverging plane waves, as described at the end of § 456 above, according to the formulæ there given. Likewise the result for a moving filament of f. These results were easily obtained, but the initial effects required closer consideration. Besides that, we have had the advantage of seeing in detail that the results of moving magnets or electrets are really due to the waves coming from the sources f and g.

But when we pass from the abstract problems of moving sources to those connected with material bodies, it must be so done that the conditions assumed are not changed by the materialisation if the results are to be the same. In particular, the ether must not be disturbed by the motion of the matter. This is the assumption I have always made in my investigations of the waves arising from moving electrification or other sources. (See, for example, *El. Pa.*, Vol. II., p. 504; and E.M.T., Vol. I., p. 269 to 282, and the above investigations.) The reasons are tolerably obvious. First, simplicity. Next, the changes due to any dragging along of the ether with the matter cannot be determined without some assumptions as to the extent of the drag, and its nature. This is one of the unsettled and very speculative matters in electrical science applied to moving bodies. I would rather have no drag at all, or else complete drag, if I had the management of it. But it may be that a partial drag is an essential condition of the connection between ether and matter, even though that connection be entirely through electrification, that is, by ions or electrons. Even a full drag is not inconceivable. For consider a single charge or electron moving through the ether without any assumed drag externally. It might really be the limiting case of a moving ether; that is, the electrification might be inexorably associated with a definite part of the ether. Or again, with perfect slipping possible, resultant effects of moving collections of matter and electrification might give an apparent motion to the ether in the circuital equations.

§ 470. The question of the drag of a moving body on the ether has occupied the attention of physicists for a very long time, especially from the optical point of view, and it is open to question whether the last word has been said about it by the latest investigators. The following comparisons of different results will serve to illustrate some aspects of the subject.

Divide the displacement **D** and the induction **B** each into two parts, thus,

$$\mathbf{D} = c\mathbf{E} = (c_0 + c_1)\mathbf{E} = \mathbf{D}_0 + \mathbf{D}_1, \tag{1}$$

$$\mathbf{B} = \mu\mathbf{H} = (\mu_0 + \mu_1)\mathbf{H} = \mathbf{B}_0 + \mathbf{B}_1. \tag{2}$$

Here $\mathbf{B}_0$ and $\mathbf{D}_0$ belong to the ether, and $\mathbf{B}_1$ and $\mathbf{D}_1$ are the extra parts due to the matter, that is, the two polarisations, magnetic and electric.

Next, write the two circuital laws for a moving medium in the form

$$\operatorname{curl}(\mathbf{H} - \mathrm{V}\mathbf{D}_0\mathbf{q}_0 - \mathrm{V}\mathbf{D}_1\mathbf{q}_1) = \mathbf{C} + \dot{\mathbf{D}} + \mathbf{u}\rho, \tag{3}$$

$$-\operatorname{curl}(\mathbf{E} - \mathrm{V}\mathbf{w}_0\mathbf{B}_0 - \mathrm{V}\mathbf{w}_1\mathbf{B}_1) = \dot{\mathbf{B}}. \tag{4}$$

Compare with § 71, Vol. I. We leave out impressed forces, except motional, also the hypothetical magnetic conduction current and magnetification. As regards the motional electric and magnetic forces, instead of one velocity, there are now four, one for each part of the two fluxes concerned. This is required for our comparisons. As for u, the velocity of the electrification ρ or divD, it need not be assumed to be the same as that of the matter.

To ease matters, let there be a simple plane wave traversing a non-conducting dielectric without volume electrification, and let $\mathbf{E} \parallel \mathrm{x}$, $\mathbf{H} \parallel \mathrm{y}$, $\mathrm{VEH} \parallel \mathrm{z}$, and let all the q's and w's be $\parallel \mathrm{z}$. Then $\mathrm{V}\mathbf{q}_0\mathbf{D}_0 \parallel \mathbf{H}$; also $\mathrm{V}\mathbf{q}_1\mathbf{D}_1$; and $\mathrm{V}\mathbf{B}_0\mathbf{w}_0 \parallel \mathbf{E}$; also $\mathrm{V}\mathbf{B}_1\mathbf{w}_1$. These simplifications bring the circuital equations to

$$-\Delta(\mathrm{H} + q_0\mathrm{D}_0 + q_1\mathrm{D}_1) = p\mathrm{D}, \tag{5}$$

$$-\Delta(\mathrm{E} + w_0\mathrm{B}_0 + w_1\mathrm{B}_1) = p\mathrm{B}, \tag{6}$$

where Δ is d/dz and p is d/dt. All scalars now.

But the type of a plane wave is $f(z - \mathrm{U}t)$, where U is the wave speed. So $p = -\mathrm{U}\Delta$, and therefore

$$\mathrm{H} + q_0\mathrm{D}_0 + q_1\mathrm{D}_1 = \mathrm{UD}, \tag{7}$$

$$\mathrm{E} + w_0\mathrm{B}_0 + w_1\mathrm{B}_1 = \mathrm{UB}. \tag{8}$$

These are the same as

$$\mathrm{H} = (\mathrm{U} - q)\mathrm{D}, \tag{9}$$

$$\mathrm{E} = (\mathrm{U} - w)\mathrm{B}, \tag{10}$$

where q and w are the speeds given by

$$q = \frac{c_0q_0 + c_1q_1}{c}, \qquad w = \frac{\mu_0w_0 + \mu_1w_1}{\mu}. \tag{11}$$

So there are only two effective speeds of motion. In this notation the circuital equations become

$$\operatorname{curl}(\mathbf{H} - \mathrm{V}\mathbf{D}q) = \mathbf{C} + \dot{\mathbf{D}} + \mathbf{u}\rho, \tag{12}$$

$$-\operatorname{curl}(\mathbf{E} - \mathrm{V}\mathbf{w}\mathbf{B}) = \dot{\mathbf{B}}. \tag{13}$$

When q and w are zero, $\mathrm{U} = v$, given by $\mu cv^2 = 1$. And in general, (9) and (10) lead to

$$v^2 = (\mathrm{U} - q)(\mathrm{U} - w); \tag{14}$$

of which the solution is

$$\mathrm{U} = \tfrac{1}{2}(q + w) + \sqrt{v^2 + \tfrac{1}{4}(q - w)^2}; \tag{15}$$

and further, when q and w are small compared with v, we get

$$\mathrm{U} - v = \tfrac{1}{2}(q + w). \tag{16}$$

This represents the increased wave speed (referred to stagnant ether at a distance) due to the motion of the matter. It is the mean of the effective speeds associated with D and B. Now compare different cases.

§ 471. (1). When there is symmetry, so that $c_1/c = \mu_1/\mu$, and also $q_0 = w_0$, $q_1 = w_1$, then

$$q = w = \frac{q_0c_0 + q_1c_1}{c}, \tag{17}$$

and

$$\mathrm{U} - v = q, \tag{18}$$

exactly; that is, without limitation to small speeds. This is a fanciful case, though interesting.

(2). Let $q_0 = q_1 = w_0 = w_1$; then also $= q$, and

$$\mathrm{U} - v = q, \tag{19}$$

again exactly. Here q is the speed of the matter and ether moving together, equivalent to a single medium theory. There is full superposition of velocities; that is, the wave speed *through the body* is the same whether it is stationary or moving. This is the result we ought to have in any rational theory of one medium, in a primary theory, that is to say. (See Preface to Vol. 1, E.M.T. for remarks on this subject.)

(3). Consider an unmagnetisable body, $\mu_1 = 0$. Then

$$\mathrm{U} - v = \frac{c_0q_0 + c_1q_1}{2c} + \tfrac{1}{2}w_0. \tag{20}$$

If we can agree that w_0 should be the same as q_0, then

$$\mathrm{U} - v = \tfrac{1}{2}q_0\left(1 + \frac{c_0}{c}\right) + \tfrac{1}{2}q_1\frac{c_1}{c}. \tag{21}$$

(4). If the ether is entirely left behind as the matter moves through it, we may take $q_0 = 0$ in (21); then

$$\mathrm{U} - v = \tfrac{1}{2}q_1\frac{c_1}{c} \tag{22}$$

Here q_1 is the speed of the matter. The result is therefore just one-half of Fresnel's result, according to which, in the present notation, the extra wave speed is q_1c_1/c, which means that the wave traverses the moving body more slowly than when it is at rest by the amount q_1c_0/c.

(5). Let q_0 and q_1 be both zero in the first circuital law, and $\mathrm{w}_0 = \mathrm{w}_1$ in the second. Then

$$\mathrm{U} - v = \tfrac{1}{2}w, \tag{23}$$

where w is the velocity of the matter. This result was obtained by J. J. Thomson by using Maxwell's theory in its unamended form. In my amendment of the same, given in 1885, I concluded that the motional argument which led Maxwell to the motional electric force $\mathrm{e} = \mathrm{V}\mathfrak{w}\mathfrak{B}$ involved a similar one leading to a motional magnetic force $\mathfrak{h} = \mathrm{V}\mathfrak{D}\mathfrak{w}$, using the full flux in the case of $\mathfrak{h}$ quite as much as in the case of e; for an obvious gastronomical reason relating to sauce. Whether right or wrong, it rationalises Maxwell's theory, and I maintain, as before, that it is the proper expression of his theory, because of his form of the motional electric force. It leads to a full superposition of velocities, as in example (2) above. But it does not follow that either e or $\mathfrak{h}$ is correct in form universally. That is a distinct question.

(6.) Larmor, "Ether and Matter,"* p. 60, takes $q_0=0$ in the first law, and $w_0=w_1=q_1$ in the second. This produces

$$U-v=\tfrac{1}{2}w\left(1+\frac{c_1}{c}\right), \tag{24}$$

where w is the speed of the matter. This is the mean of J. J. Thomson's and Fresnel's results. The ether is assumed to be stagnant, or not dragged at all. Nevertheless, the full $e=VwB$ is used, but the full $h=VDw$ is replaced by VD_1w. This pictures the larmorial bearings correctly, I think.

(7.) But Larmor (*l.c.*) does not obtain the result (24), but Fresnel's wc_1/c instead. This is, in fact, the reason why he adopts VD_1w, though it may be questioned whether the optical result is sufficient to determine the theory. His equations are equivalent to

$$-\Delta(H+wD_1)=cpE, \tag{25}$$

$$-\Delta(E+wB)=\mu pH, \tag{26}$$

in my notation. I derive (24) in the above way, getting

$$v^2=\left(U-w\frac{c_1}{c}\right)(U-w) \tag{27}$$

for the quadratic, a special case of (14) above.

It may perhaps fairly be asked, if the assumed fact that the ether is stationary causes the influence of the electric polarisation to introduce $h_1=VD_1w$, why should not the influence of the magnetic polarisation introduce $e_1=VB_1w$? I do not dogmatise, but wait for more light.

(8.) Let us see what connection is needed between q_0 and q_1 to obtain Fresnel's result. That depends upon w_0 and w_1 also. If we take, as seems the fairest at first sight, $w_0=q_0$ and $w_1=q_1$, then equation (21) supplies the answer, for an unmagnetisable medium. The right member has to be q_1c_1/c; so

$$\frac{q_0}{q_1}=\frac{c_1}{c+c_0}=\frac{c_1}{2c_0+c_1}, \tag{27A}$$

which may be grossly imagined to represent the drag of the matter on the ether. It is here conditioned by the electric polarisation, and cannot exist without it. It is small when c_1/c_0 is small, but may be nearly unity with large c_1/c_0. The corresponding e is

$$e=V(w_0B_0+w_1B_1)=VwB$$

where

$$w=\frac{\mu_0q_0+\mu_1q_1}{\mu}=\left(\frac{\mu_1}{\mu}+\frac{\mu_0}{\mu}\frac{c_1}{2c_0+c_1}\right)q_1 \tag{28}$$

So e is zero in an unpolarisable medium, for then $\mu_1=0$, $c_1=0$. But this e is the electric force impressed in a wire carried perpendicularly across the lines of magnetic force in a stationary ether. The vanishing of e seems wrong at first; but there is no necessary absurdity. For by assumption the body is unpolarisable, and is unaffected by either magnetic or electric force. Being perfectly neutral, why should there be an e impressed upon it when it just slips through the ether without disturbing it? Then why, on the present hypothesis, is there e in a conductor? Because c_1 is not zero. Conduction in the physical part of Maxwell's theory implies polarisation, because it is a breaking down of the displacement, with external renewal of the same, maintaining an average steady state of D. The value of c/c_0 can only be measured in very poor conductors. Even then it may be very large: for example, the value 60 to 80 in water has been found. It is likely to be much larger in good conductors. This would make $e=VwB$ closely, with $w=q_1$ nearly, with nearly full drag of the ether, or what is equivalent thereto.

If, on the other hand, we assume $w_0=q_1$, and inquire into the relation between q_0 and q_1 to obtain Fresnel's result in an unmagnetisable medium, we have

$$\frac{q_0c_0}{2c}+\frac{q_1c_1}{2}=\frac{q_1c_1}{c}, \tag{29}$$

which makes q_0 be negative; nothing more need be said abou that.

It is to be noted that should c_1/c be very large, the idea and the measure of D_1 as an elastic phenomenon becomes indistinct. It is then also of little importance to preserve it in the equations, because conduction, unless very feeble, works a revolution in the manner of propagation, turning elastic waves to diffusive waves. The precise nature of the failure to support elastic displacement without a continuous supply of energy, in relation to the ions, electrons, or corpuscles, is a matter of speculation at present. I am rather prejudiced against the view that in a solid conductor the conduction consists of a continuous flow of electrons or of J. J. Thomson's corpuscles either one or both ways, and think it more likely to be a local phenomenon in the main.

(9.) A very simple way of obtaining Fresnel's result is to assume $e=Vqb$, $h=VDq$, that is, the standard forms of e and h, but with the velocity of q so chosen as to give the required result. We require

$$q=\frac{c_1}{c}q_1, \tag{30}$$

if q_1 is the real velocity of the matter. This applies to both circuital equations. But an electrical argument founded upon the absence of drag which would justify this procedure in the first circuital law, would surely fail in the second. However, there is this remarkability, that Fresnel's result becomes exact, instead of for small speeds only of the matter. I do not know that this is to be considered a recommendation. But it may be possible to invent some hypothesis to justify the procedure in the second circuital equation as well as in the first.

There is a difficulty in applying optical evidence to the circuital laws which has not been mentioned, viz., dispersion and change of wave-speed with the frequency of vibration. In applications involving assumed definite equations of motion or of connection between the etherial E and the molecular atomic electrical arrangements, the symbols c and μ, constants for the ether, become differential operators (functions of p), and the permittivity and inductivity can only be effectively constants at a given frequency of simply periodic vibration. This must necessarily affect in some degree all arguments of the above kind.

§ 472. The general nature of the modification of electrical distributions due to the introduction of the four velocities q_1, q_2, w_1 and w_2 in the circuital equations (3), (4) above may be readily seen in the manner of § 164, Vol. 1, by considering the effect of moving a single charge in a homogeneous medium. Using them in the form (12), (13), impress upon the whole system the velocity $-u$. This makes

$$\text{curl}\,\{H-VD(q-u)\}=\dot{D}, \tag{31}$$

$$-\text{curl}\,\{E-V(w-u)B\}=\dot{B}. \tag{32}$$

As we have not altered the relative velocities by thus bringing the electrification to rest, these are the proper equations when we travel with the electrification. In a steady state, that is to say, moving forward steadily at speed u, the right members vanish. Equation (31) then gives

$$H=VD(q-u), \tag{33}$$

and (32) makes

$$\text{curl}\,\{E-V(w-u)B\}=0. \tag{34}$$

Insert (33) in (34), and suppose u is parallel to k. Then the vector

$$\begin{aligned}&E+\mu c(u-q)(u-w)VkVkE\\&=E+\mu c(u-q)(u-w)(kE_3-E)\\&=(1-m^2)E+m^2E_3k \quad \text{if } m^2v^2=(u-q)(u-w).\end{aligned} \tag{35}$$

By (34) it is polar. So the vector

$$E+\frac{m^2}{1-m^2}kE_3=iE_1+jE_2+\frac{kE_3}{1-m^2} \tag{36}$$

is polar. Therefore

$$D=-c\{i\nabla_1+j\nabla_2+k(1-m^2)\nabla_3\}P, \tag{37}$$

where P is the potential. The result is, when m^2 is positive, to effectively reduce the permittivity in the line of motion both ways, to an amount governed by the size of m^2, so as to cause a concentration of displacement equatorially. This concentration is complete when $m^2=1$. Then $u=U$. That is, the previously investigated U is the speed with which the electrification must move to make a plane wave. There is no distortion when either $u=q$, or $u=w$, if u and w are unequal.

* I can recommend this work as a brain-stiffener during the hot weather. It deals with many abstruse questions.

Digitized by Google

But m^2 is not necessarily positive. If u lies between q and w, m^2 is negative, and the distortion is a concentration in the line of motion. As an eminent authority once remarked, there is a lot of humbug in mathematical papers. He knew, having done it himself several times. To obviate a remark of that sort, I remark that the cases of vanishing distortion are unlike as regards H. For, if $u = q$, then $H = 0$; but if $u = w$, then $H = VD(q - w)$, showing magnetic force proportional to the difference of the speeds associated with D and B. In general, H is positive or negative according as q exceeds or is less than w. Unless D is reversed. When can that happen? When $m^2 > 1$. Then, as in the case of a charge moving through Maxwell's ether at a speed greater than that of light, there is a generation of an impure conical wave within which D is reversed.

(*To be continued.*)

ON THE MAINTENANCE OF CERTAIN PORTIONS OF DISTRIBUTING SYSTEMS AT EARTH POTENTIAL.*

BY C. H. WORDINGHAM, M.I.C.E., &c.
(City Electrical and Tramways Engineer, Manchester.)

From the very earliest days of the application of the science of electricity to practical needs, the earth, or as our American brothers prefer to term it, the ground, has played a prominent part, and each branch of electrical industry has in turn set up a claim to a vested interest in it. The potential of the earth is usually taken as zero, other potentials being reckoned with respect to it. This, however, does not accord strictly with the facts, since a difference of potential may, and very frequently does, exist between two points on the earth's surface; such difference of potential, however, is never very great. The earth in some text books is regarded as forming a large reservoir, and its office is stated to be that of maintaining the potential of a point connected to it at zero. Thus, if a battery has one pole connected to earth, and the other to one end of a long conductor, and the far end of the conductor be connected to earth so that a current flows, the earth is regarded as merely absorbing the electricity that passes along the wire by draining down its potential to the same value as the potential of the earth at the battery end of the line, and no actual current is supposed to flow through the earth back to the battery. This explanation is not borne out by experience, as the return currents can actually be detected, and it is more correct and more convenient to regard the earth as a large conductor through which the current actually does flow.

The earth may be used in two distinct ways. It may either be employed to take the place of an ordinary conductor, as in telegraphy and telephony, in which case the whole of the outgoing current has to return by the earth, or it may be employed merely to keep one of the conductors of an electrical system at or near zero potential. No one would now think of intentionally employing the earth in the former manner when energy was to be transmitted at any appreciable rate, and even for signalling circuits its use in this manner is attended with great disadvantages. We may therefore confine our attention to the second way in which the earth is employed, namely, to keep down the potential of one portion of an electrical system of transmission.

It will be convenient in considering the various practical instances of earth connections to divide the subject into high-pressure and low-pressure circuits, and to further subdivide the latter into those circuits which have a conductor earthed at one point only, and those which are earthed at more than one point. If there be a two-wire circuit, consisting of a generator, two conductors and a consuming device, such as a transformer, and if a given difference of potential be maintained between the two conductors by the generator, then if all parts of the circuit be equally well insulated, each conductor will assume a potential relatively to the earth, which is half the difference of potential between the two. In other words, if the pressure be 10,000 volts one conductor will be 5,000 volts above earth, and the other 5,000 volts below earth. If, however, the insulation resistance of one conductor falls below that of the other, the conductor's potential with respect to the earth will at once diminish, while that of the other conductor will increase, and, if the insulation of one conductor fail altogether it will arrive at earth potential, while the other conductor will alter to 10,000 volts above or below the earth, as the case may be. Now it is obvious that if the conductors be insulated only with a view to withstanding the normal potential from earth, *i.e.*, 5,000 volts, an undue stress will be placed upon the better insulated conductor when the insulation resistance of the other falls, and this stress may be sufficient to cause the other to break down also. Inasmuch as it is impossible to foresee which conductor may assume the potential of the earth, it would appear that if both have to be insulated, both must be capable of withstanding a pressure of 10,000 volts. It was first pointed out, the author believes by Mr. Ferranti, that, seeing that either conductor might have to withstand the full pressure, it would be best to at once face the situation and insulate one of them for the maximum pressure possible, and insure that it alone should be subjected to this pressure by deliberately connecting the other conductor to earth. This exceedingly simple, and at the same time ingenious, device at once diminished the risk of breakdown and cheapened the cost of insulation, but at the same time it enabled a further great advantage to be reaped by admitting of much greater security to life being introduced. This end was attained by completely enclosing the insulated conductor within the uninsulated one, thus rendering it physically impossible to handle a conductor at a dangerously high potential, and if by any chance the outer conductor should be cut through, a short circuit would be established before the inner conductor could be touched.

This system has been almost universally adopted for two-wire high-pressure circuits, and is perfectly familiar to all at the present time, but it is worth while recording the fact that when originally introduced many people looked askance at connecting a high-pressure conductor to earth. For systems of transmission employing more than two wires the same perfect security cannot be attained, but a near approach may be made with two-phase working by employing two separate concentric cables, the outer conductors of which are connected to earth, or by enclosing two parallel conductors within an outer envelope. In three-phase working, if a star winding be employed, the middle point of such winding may be connected to earth. When this is done the stress on the insulation from earth is diminished to the smallest possible value, but all three conductors have to be insulated. It is important that one point only of the zero potential conductor should be conducted to earth, because inasmuch as there must of necessity be some fall of potential in the outer conductor, there exists between any point and the one connected to earth a difference of potential depending upon the resistance of the conductor and the current flowing through it. So long as the outer conductor is insulated from earth, except at one earth connection, no current can pass through the earth; but if a connection be established with earth at some distant point, the difference of potential between it and the other point will cause current to flow through the earth.

A digression may here be made to point out exactly the manner in which such return currents travel through the earth. A most instructive experiment carried out by the author in his student days, under Prof. W. Grylls Adams, made such an impression on him, and has been found by him to be so helpful, that he may perhaps be pardoned for describing it. In a large flat sheet of tinfoil two needles were fixed, connected respectively to the two poles of a battery, which thus sends a current through the tinfoil. A sensitive galvanometer was provided and its ends connected each to a needle; one of these needles was stuck at random into the tinfoil, and the other was moved about on the tinfoil until a point was found which gave no deflection on the galvanometer. The needle was then pressed into the tinfoil, and an impression left on a sheet of clean paper underneath. A series of such positions were found, corresponding to an equi-potential line in the tinfoil. The first needle was then moved to a new position and a second equi-potential line traced out. When a sufficient number of such lines had been determined, other lines normal to them were drawn between the two points to which the battery had been connected. This, of course, represented the lines of flow of the current. Anyone who carries out this experiment for himself will be at once struck with the number and diversity of the paths along which the current can flow. These paths spread out in the same manner as the lines of force from a magnet, and extend to a great distance away from a direct line.

In the case considered of a conductor carrying a heavy current and unearthed at two points of its length, the current may return from one point to the other by paths that are an almost incredible distance away from the main conductor, though, of course, the bulk of the current will take the shortest possible path through the earth. If two plates be buried in the earth at two points along a line of flow and be connected together through a conductor, this conductor will take up a portion of the current. If the conductor be part of a signalling circuit the signalling currents will be interfered with, and, with any conductor, electrolytic action may take place at one or both points of connection with the earth. If, instead of dealing with the high pressures, we are dealing with low, exactly the same effect will be produced by making one or more earth connections to a conductor, but the objects of making the earth connection are usually different. In the case of a low-pressure distribution system, the object of earthing one conductor is not to diminish the cost of the insulation, since no appreciable saving is made by using a pressure of, say, 200 volts instead of 400 volts, nor is it to secure safety to life; the chief object is to enable a consumer to be supplied at such a pressure

* Paper read before the Municipal Electrical Association, at Leeds, June 25.

Digitized by Google

that no one of the conductors brought into his house will exceed the limit of pressure defined by the Board of Trade to be low pressure. In the case of electrically-driven tramways, the one object is to enable the rails to be used as one conductor, chiefly with a view to simplifying the working arrangements, and partly to enable the conducting power of the rails, which must in any case be laid, to be utilised. In this last case it is obvious that the conductor is connected to earth throughout its length, and the only way to obviate the difficulties pointed out on the score of current returning by the earth is to keep the difference of potential between the ends of the earth conductor so low as to cause the amount of current returning by the earth and metallic structures buried in it, other than the rails, to be very small. With these preliminary observations we may now consider some particular cases. The author regards all the high-pressure systems as systems of transmission, though it is true that at present high pressure is still used to some extent for distribution. Inasmuch as this Paper deals only with the earthing of distribution systems, the author proposes to confine his attention to these.

The most important case of earthing conductors is undoubtedly that of tramways. The system adopted so largely in America has been imported into this country, and every tramway system, excluding battery driven cars, is being worked with one conductor insulated and the other consisting of the rails connected to earth. It is well-known that if the difference of potential between the end of the earthed conductor which is connected to the source of energy differ in potential considerably from that of a distant point on the same conductor, the current returning through the mass of the earth and through pipes buried in it may be very large and may cause most serious damage to the pipes by causing the metal to be dissolved at the points at which the current leaves. How great this difference of potential must be before serious damage is done is a matter upon which there is not a large amount of information available. The Board of Trade have fixed the limit of what may be allowed at 7 volts, but it is maintained by some authorities that this limit is too high and that a lower potential than 7 volts will cause damage. This point is receiving a considerable amount of attention at the present time and the author is himself engaged in a joint investigation with engineers of other departments of the Manchester Corporation with a view to thoroughly thrashing out what is the minimum difference of potential that can be allowed. It is obviously in the interests of all concerned to arrive at reliable data on the subject. If 7 volts be found to be safe, well and good, but if not the sooner it is known to be dangerous the better. All engineers must be agreed that the lower one can keep down the difference of potential the better. The object may be effected in various ways. One of the most common is to provide auxiliary conductors of low resistance which are tapped on to the rails at various points to supplement their conductivity. Another device is to employ similar conductors but to lower the potential of the far end by means of so-called negative boosters which subtract instead of add a certain number of volts. A third means, and in the author's opinion the best and most effectual, is to feed the line from a number of independent points either by means of a number of generating stations or, preferably, by means of a number of transforming sub-stations. Except in the case of very heavy traffic this method should prove effectual without either the employment of return feeders or negative boosters.

The simplicity and reliability of the so-called overhead system of traction are such as to render it worth while to go to great lengths to retain the system, but if it be found and clearly demonstrated that extremely minute differences of potential are sufficient to cause serious damage to underground structures in urban districts, it will be necessary to re-consider the whole position, and perhaps to adopt an insulated return conductor, or else to fall back upon a battery system of self-contained cars, either of which expedients would be greatly to be deplored.

The second case of earthing in order of importance is that of one conductor of ordinary lighting and power circuits, and it is on this point that the author desires to raise discussion chiefly. It has been hotly debated, and much difference of opinion still exists as to whether it is desirable or not to earth the middle wire of a three-wire system. Let us consider what are the advantages and disadvantages of such a course. The main advantages are the following: (1) By earthing the middle conductor the extreme difference of potential that can be attained by any one of the conductors from earth is halved, and all can be handled not only with great safety, but practically without inconvenience. (2) The stress on the insulation is halved. (3) All three conductors may be taken into a consumer's premises for all pressures up to and including 250 volts pressure across the outers without contravention of the regulations of the Board of Trade. This advantage is undoubtedly by far the most important. (4) Immediate notice of a leak on one of the outer conductors is given.

The disadvantages of earthing the middle conductor are: (1) If a leak exists on one conductor, current is continually forced through it, thus causing in many cases complete destruction of the insulating material. (2) A leak on one conductor produces a short circuit on one side of the system of distribution, unless the earth connection is removable at will.

In Manchester the Board of Trade require that the middle conductor shall be maintained at or near the earth potential, and the author has now had nearly seven years' experience of this system. In his judgment there can be no possible doubt that at all events with continuous current, and quite possibly with alternating, the effect upon the insulating material of the negative main is most severe. In operating a system of distribution by means of continuous currents, it is always found that if none of the conductors be deliberatively earthed those connected to the negative pole assume earth potential; the positive conductors consequently being at the maximum potential above earth corresponding to the pressure used on the system. The reason for this is well known. It is the phenomenon known as electric osmosis, whereby moisture tends to travel away from the positive pole and towards the negative pole. Whatever system of mains be employed there are always many points at which surface leakage can take place, and whether the conductors be bare copper on porcelain insulators, or be continuously insulated cables, at every point where the conductor is exposed leakage from the negative pole will take place, but if the negative conductor be kept near earth potential, this tendency will be small. If, however, the middle conductor be deliberately connected with earth so that the negative outer is kept below earth potential, a current corresponding to the amount of the leakage will be constantly forced through the leak, and the tendency for moisture to flow to the negative conductor will be maintained. If the leakage was confined to the surface of the insulation at points of connection to the conductors the result would not be so serious, but the author has found that with certain makes of rubber the material is evidently porous, and small as is the leakage current at first, it is sufficient to cause water to enter through the pores of the rubber, and the conductivity of this water so increases the leak that in course of time the whole of the rubber on the negative conductors is destroyed, large blisters forming within its substance and becoming filled with strongly alkaline liquid almost certainly derived from the substances mixed with the rubber. The rubber is often much distended, causing the liquid to be under considerable pressure. In course of time this pressure increases to such an extent as to burst the rubber, causing a hole completely through the insulating material. It is clear that the water could not merely flow into these blisters; it is almost certainly driven in by osmosis. What happens with rubber may happen with other materials and, in the author's opinion, there can be no doubt whatever that very grave risk of breakdown of the insulation of the negative conductors is introduced by earthing the middle conductor.

As a set-off against the above inconvenience it must not be forgotten that the insulation resistance of the positive conductors is substantially improved by earthing the middle one, but very little importance need be attached to this, since, as already stated, the negative conductor would be at earth potential if the middle one was not earthed, and the tendency to dry the positive outer would then be doubled. The only consideration that impels me to desire to earth the middle conductor is the fact that it admits of all three conductors being brought into a consumer's premises, thus enabling every installation to be balanced within itself if it be of sufficient size to render it desirable to do so. The author is convinced that the only method of effectually balancing a multiple wire system is to carry that balancing back to every consumer except to consumers of the very smallest size and, therefore, it is of great importance to be allowed to bring the three conductors into installations. Serious as are the disadvantages, this advantage is, in his judgment, sufficient to outweigh them, and, therefore, he would, on the whole, decide in favour of earthing the middle conductor, but if this be done it must be clearly understood that it necessitates the utmost care in protecting the mains from moisture and the only possible system of laying them becomes the so-called solid system, in which every cable is completely surrounded by a thoroughly waterproof material, or an air-insulated system with accessible porcelain insulators at intervals, as in the Crompton system of bare copper. If it be granted that the middle conductor should be earthed, the question at once arises should it be permanently and irrevocably earthed or should the earth connection be capable of removal at will. The author would unhesitatingly reply "it *must* be removable." The first consideration is continuity of supply, and, if a leak developing on one conductor is to cause a short circuit the chances of interruption are increased manifold beyond what they would be if the earth connection could be removed until the fault had been localised and repaired. It is quite clear that the chances of a leak occurring on one conductor are many times greater than those of two leaks occurring on two separate conductors simultaneously. It may be argued that if the earth connection is liable to be removed all the advantages of making it at all are done away with, since the distribution of potential will alter when it is cut off. To some extent this is true, but it must be remembered that the connection would only need to be removed for short periods and at long intervals and, therefore, in practice but

Digitized by Google

little risk would arise. If it were a question of dangerous pressures it would be entirely different; in such case the earth connection must never be removed while the main is in use. Once it be granted that the earth connection must be removable it becomes obvious that the conductors must be earthed at one point only, and that must be easily accessible from the generating station. This consideration shows that it is impossible to allow one of the conductors in a consumer's installation to be uninsulated, a system of wiring frequently advocated by some on account of its cheapness and some other advantages.

There is, however, another reason for not using this system of wiring, depending on the undesirability, already pointed out, of earthing a conductor at more points than one. It is often argued by the advocates of the system that the balancing wires carry so little current that the fall of potential in them is negligible. It is true that balancing wires frequently bring back but little current to the generating station, but locally it is unavoidable that these should be heavy currents, causing substantial differences of potential, flowing between the various installations, composing a balanced main, and these differences of potential may cause destructive electrolysis, and, with alternating currents, interference with telephone lines. Certain special features arise in connection with a distributing network fed from transforming sub-stations supplied with high-pressure current to which attention may be called. In a case likely to become not unusual in practice, namely, that of three-phase transmission with rotatory converters supplying continuous current to the network, it will probably be required that the grouping of the transformers shall be star and the middle point be earthed. Now, if this point, which is also directly connected to the middle distributing conductor be earthed at the transformer, we shall have all the disadvantages of a middle conductor earthed at several points. A much more serious case, will, however, arise if, in addition to this, the middle wire be opened between two sub-stations but the outers be carried through. In such an event the whole balancing current may be conveyed by the earth and do great damage. A similar difficulty would arise with balancing transformers distributed at various points of the network if the middle wires are not continuous throughout, and an earth connection is made in the balancers. In order to comply with this condition of earthing the middle point of the transformers, the earth should be made by connecting the middle wire to the point in question and earthing this middle wire at one point only for the whole system.

The author has made no attempt to treat this subject at all fully, his desire being merely to raise a discussion on the subject generally of connecting any portion of a distribution system to earth, the chief points being: (1) Should any portion of any system of distributing conductors, whether for the ordinary supply of energy or for traction, be connected to earth. (2) If such a course is desirable what conductor or conductors should be earthed, and at what point or points. (3) What difficulties may be expected from earthed conductors, and in what way may these difficulties be met, especially in the case of distribution for electric traction purposes.

The following is an abstract of the discussion on the above Paper:—

Mr. A. P. TROTTER (communicated): In this valuable Paper the author assumes, in accordance with his own practice, that no resistance is intentionally introduced in the earth connection. The advantages and disadvantages of adding, say, 1 ohm, to prevent a dead short-circuit, might be discussed, and it would be interesting to hear the experiences of those who use recording ampere-meters in the earthing circuit. It has been proposed to earth at the feeding points instead of at the works. Ampere-meters would have to be placed at the works in order that leaks might be noted, by observing the current passing to earth at each point; but the advantages to be gained do not seem to balance the disadvantages, the chief of which is the impossibility of cutting off the earth connection, temporarily, at short notice, in case of an accident. Lead-sheathing of cables generally constitutes a connection to earth, and electrical precautions for its protection seem to come within the scope of this Paper. The advisability of keeping the lead 2 volts or 4 volts negative to the middle 'bus-bar seems worthy of consideration.

Mr. S. Z. DE FERRANTI (Hollinwood) agreed with Mr. Wordingham's views on this subject; he did not think there was any doubt about it that the central conductor should be earthed.

Mr. J. F. C. SNELL (Sunderland) thought Mr. Wordingham had put the case before them in a masterly manner. He would like to ask if the direct-current engineers had considered the difference in cost between a three-wire distribution and a two-wire distribution. On actual tenders received he found that the only saving for a three-wire distribution for precisely the same capacity as the two-wire was 8 per cent. If that be the case, what was the use of having a three-wire system at all? If the repairs on a three-wire system increased, might one not say that there was an actual saving in putting in a two-wire distribution instead of a three-wire? In the case of St. Pancras, where they had a five-wire system, the whole of the cables were jute, lead-covered, and as a rule the negative was equal to earth. In actual practice, where a fault developed on the middle wire of a three-wire system, it was a most difficult matter to localise it. He thought it would increase the simplicity and the reliability by adopting the two-wire system.

Mr. W. A. CHAMEN (Glasgow) said the practice at Glasgow at present was earthing through a resistance. The fact that they had lead-covered cables brought into the consideration points which did not trouble Mr. Wordingham. Another matter was that they had concentric cables, and when these were employed it was necessary to use fuses. The plan he had adopted to reduce electrolysis to a minimum was to use a triple concentric, having the positive in the centre and the negative next to the centre conductor. They connected to earth at only one point through recording instruments required by the Board of Trade. If they could get a proper earth to all their water mains in Glasgow, then he thought they would not have much trouble. He had one day a very remarkable case with a distributor going wrong, showing an earth connection on the middle wire; but it was very slight indeed, being just sufficient to light up a 16 c.p. lamp. He noticed the lamp rapidly dropping; they reversed the connections, and the lamp immediately lit up and gradually went down.

Mr. E. TREMLETT CARTER thought he might say a few words upon the tramway question. Some years ago he saw in Cincinnati some experiments to get over the earth return on the trolley system. The double trolley might be quite satisfactory to the water companies and the gas companies, but the trouble consequent upon having two bare wires at 500 volts or 550 volts only a few inches apart was serious and made complicated crossings. It was also necessary to carry two independent trolley wheels on each car, and there were great risks of causing short circuits through the jumping of the trolley arm. In the trolley system, he thought, they *must* carry the return current through the rails, and some of it would travel along the gas and water pipes in the neighbourhood. The question really was, "How were they to minimize the eating of the pipes?" With only the 7 volts limit, the eating of the pipes did go on, and he thought that even with only 2 volts this would occur. It was like slow poison: the time would come when those pipes would come down to the thickness of tissue paper, and then there would be a catastrophe, if not before. What they had to consider was how they could best prevent the destruction of these pipes.

Mr. R. C. QUIN (Blackpool) said he had been an advocate of earthing the middle wire on a three-wire system before the Board of Trade gave permission for this to be done, but he had had some very astounding results which had puzzled him. He referred to the installation at Brighton. There were high-tension concentric mains with the outer earthed, and low-tension three-wire mains with the middle wire earthed. The low-tension fuses on the alternating network for a distance of some 2 miles gave out, the earth fuse on the continuous current network went, the high-tension alternating fuses failed and the low-tension fuses to houses and low-tension network some 3 miles distant all went immediately. There was one common earth. He thought those present would also be puzzled at this result. At Blackpool the difficulties from electrolysis had not arisen, although they had crossed the track something like 200 times. They had also had a leakage of 400 amperes, but no sign of electrolysis. Wherever it was possible they had coupled the lead of the cables to the water pipes. The Blackpool & Fleetwood Tramway Co. had not done this, and lately they had been looking for the lead which was on their cables. He thought the whole point came in here. The current must not be allowed to pass into the earth, but must be kept in metal the whole way.

Mr. C. H. WORDINGHAM (Manchester) in replying, said that Mr. Trotter asked for information regarding ammeters on the earth connection. They had such an ammeter in Manchester, and had had the same in use for some two or three years. Their experience was that the leakage current was pretty steadily maintained, that it was always in one direction, but that it sometimes increased and decreased very considerably. These cases were, however, exceptional. He thought the cost of laying mains in Sunderland must be fairly high, and did not think that the simplicity of the two-wire system would justify their spending 8 per cent. more. Further than this, it would also not be as convenient as the three-wire system for motors, as a higher voltage could be used for this purpose. He thought that if damage was going to be done at all through electrolysis by using the earth return, it was only a question of a few years before they would be prevented from using this system, and he thought they had better face the difficulty now. He congratulated Mr. Quin upon the methods adopted to avoid electrolysis at Blackpool.

A METER FOR MEASURING TRACTIVE FORCE ON ELECTRIC TRAMCARS.*

BY GISBERT KAPP.

A tube is mounted in the car parallel to the rails, with the ends turned up to form vertical branches. Let us imagine the line to be horizontal and the tube filled with water up to a certain point in the vertical branches, which we will consider the zero point. In order to be able to observe the water level the vertical branches are glass tubes. If the tube is inclined to the horizontal the water level changes proportionally to the tangent of the angle of inclination, and an experimental scale can be marked on the branches with points corresponding to gradients of 1 in 1,000, 2 in 1,000 up or down, the position of these points being ascertained by trial. The distance of these points apart depends on the width of the branches and the length of the horizontal tube. If the car is at rest on an incline, the apparatus being, as already remarked, mounted parallel

* Paper read at the eighth annual meeting of the "Verband Deutscher Electrotechniker" at Kiel.

Digitized by Google

to the rails, the water level indicates with sufficient accuracy the horizontal gravity component per ton of rolling weight.

The accuracy is not absolute, as the displacement of the water is proportional to the tangent, the gravity component on the other hand to the sine of the angle of inclination of the track. The error is, however, even on considerable inclines, quite inconsiderable. On an incline of 5 per cent. the difference between sine and tangent is $\frac{1}{769}$, *i.e.*, 0·13 per cent., and on inclines of 10 per cent., the steepest allowable on any tram line, it is $\frac{1}{185}$, or 0·54 per cent. That proportion of the tractive force which serves to overcome the gravity component can, therefore, be directly read off on the graduated glass tube when the car is proceeding up a steady incline.

Let us now consider the car as moving with variable speed on a level track. The acceleration pressure acting on the horizontal column of liquid causes a displacement of the surface of the water. If l is the length of the horizontal tube and h the difference in height between the surface of the water in each of the vertical branches, we have the following relationship :—

$$l\frac{p}{g}=h,$$

where p is the acceleration imparted to the car, and g the acceleration of gravity. As $\frac{p}{g}$ is always less than l,

$$\frac{p}{g}=\sin\beta,$$

β being the angle through which the apparatus would have to be turned while at rest to produce the same displacement as has in this case been caused by acceleration on a horizontal track. That portion of the tractive force which goes to accelerate the car, may, therefore, be read off on the empirically graduated scale, the level of the water in this case indicating both for the incline and the acceleration the necessary tractive force per ton of rolling weight.

The following consideration will serve to show the degree of accuracy obtainable in this respect :—

In Fig. 1 let *ab* be the horizontal tube of length l, *ac* and *ad* its two vertical branches, α the angle of inclination of the track, and p the acceleration imparted to the tube in the direction of its length

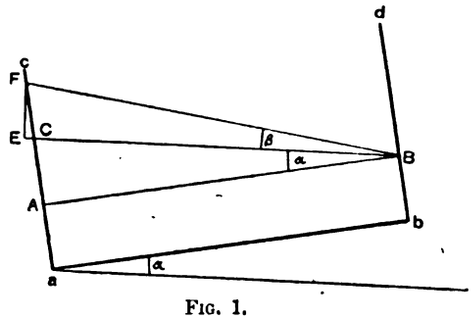

FIG. 1.

Let B and F be the water level in the two branches. Of the total difference of level read off between the two, $AF=l\tan(\alpha+\beta)$, $AC=l\tan\alpha$ is that portion due to the incline, and $CF=\frac{EF}{\cos\alpha}$ is that portion due to the acceleration, whence

$$EF=l\sqrt{1+\tan^2(\alpha+\beta)}\sin\beta,$$

$$CF=l\frac{\sqrt{1+\tan^2(\alpha+\beta)}}{\cos^2\alpha}\sin\beta.$$

The value of the expressions under the root may be taken as equal to unity without serious error. The tractive force read off on the scale is AF kg. per ton ; the true tractive force is $1{,}000\left(\sin\alpha+\frac{p}{g}\right)$kg. per ton. Introducing an element of error which we will term $1{,}000f$, we have the equation, $l\tan(\alpha+\beta)=1{,}000f+1{,}000\left(\sin\alpha+\frac{p}{g}\right)$.

As the dimensions of the apparatus are without influence on the theory here developed of its limits of error, we can give to l any dimensions we please. If we make the tube 1,000mm. the scale divided into millimetres will show the tractive force in kilogrammes per ton. The above equation thus assumes the simpler form

$$\tan(\alpha+\beta)=f+\sin\alpha+\frac{p}{g}$$

$$\tan(\alpha+\beta)=f+\sin\alpha+\sin\beta.$$

It is plain that the error is greater as the incline and acceleration increase. An average for the acceleration on street tramways will be 0·4, though occasionally it may amount to 0·75, a value which it will, however, not be likely to exceed on account of convenience to passengers. When putting on the brakes, and particularly the emergency brakes, this value may be considerably exceeded. When the apparatus is employed to determine the tractive force of the motor, the value $p=0{\cdot}75$ may be regarded as the limit. If the brake action is to be tested, a maximum retardation of 1·40 on a horizontal track must be assumed for the purpose of testing the limits of error.

Thus we have, with an acceleration of 0·4 and an incline of 5 per cent., $\sin\alpha=0{\cdot}05$; $\sin\beta=0{\cdot}4/9{\cdot}81$; $\sin\alpha+\sin\beta=0{\cdot}0907$. If the apparatus were without error it should show a difference of level of 90 7mm. In practice it shows a difference of level of 1,000 tan $(\alpha+\beta)$, which from the values above given comes out at about 91mm. The apparatus, therefore, indicates 0·3mm., *i.e.*, one-third per cent. too much. In a similar way the error for other conditions of working can be estimated from the following tables for starting and braking obtained :—

Table of Limits of Error in Starting.

Profit of track.	Horizontal.		Rising.		Falling.	
	—	—	50%	100%	50%	100%
Acceleration	0·4	0·75	0·75	0·4	0·75	0·4
Percentage error	0·00	0·29	0·60	0 82	0·23	0·38

Table of Limits of Error in Braking.

Acceleration	0·75	1·4	0·75	1·4	0·75	0·4
Percentage error	0 29	1·03	0·23	0·80	0·60	0·82

In all cases the errors are either smaller or of the same order as the errors in reading so that the apparatus may be looked upon as thoroughly suited for practical purposes.

A further and greater source of error is due to the fact that in going up hill and in starting the front springs of the car are more heavily loaded than the rear springs, while on running down hill and applying the brakes the opposite is the case. The result is that the tube *ab* does not remain perfectly parallel to the rails, but assumes a slight incline. The smaller the wheel base and the higher the centre of gravity of the car above the springs, the more the car will tend to tip under the influence of the tractive force, or of

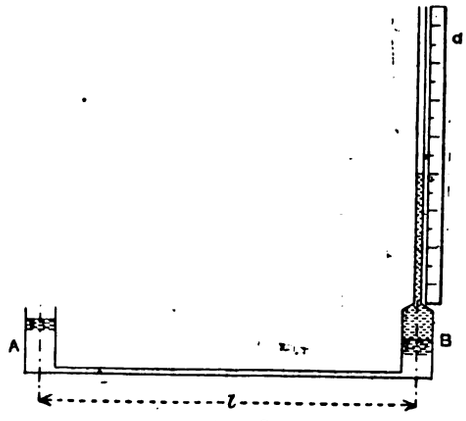

FIG. 2.

the retardation due to the brakes. The unequal distribution of the load may also cause a similar displacement. These are sources of error that depend on particular circumstances, and cannot be determined generally. Exhaustive calculations which I have made lead me to conclude that these sources of error may amount to several units per cent.

The apparatus indicates directly only that portion of the tractive force which is necessary for mounting the incline or producing the acceleration, not the remainder which is required for overcoming the friction resistance. To estimate this, the procedure is as follows : The car is set in motion on a length of track as nearly level as possible, and allowed to come to rest. The water level is read off, and indicates the retardation due to rails, gear, friction, &c. To eliminate the effect of any deviation from the horizontal, the test should be made running in each direction. The mean of the readings is the so-called traction coefficient expressed in kilogrammes per ton of rolling weight. When this coefficient has been determined it is only necessary to displace the scale by a certain fixed amount to enable the total tractive force to be read off.

The form of the apparatus just described is suited for being permanently fixed up in motor-cars, the length of the tubes *ab* being as long as the frame of the car will allow, the vertical branches being brought up at any convenient spot. One of the upright tubes may be provided with a float adapted to operate a recording instrument for producing a permanent record on a paper strip mounted on a time-controlled drum in the ordinary way. In this way is obtained a curve of the tractive force as a function of the track. The integration of this curve is the work per ton of rolling weight. Instead of the water tube, a suitably graduated manometer may be employed. In any case, the apparatus constructed as above is not very portable, owing to the length of the tube *ab*. To obtain a portable apparatus I have employed two liquids—mercury, to produce the difference of pressure, and water to indicate it. This apparatus is shown in Fig. 2.

Digitized by Google

AB are two pots of 40mm. in diameter, *l* is the connecting tube of such a length that the centres of the pots are separated by a distance of 50cm. *d* is the water tube, the bore of which is 5mm. With these proportions an incline of 0·1 per cent. corresponds to a displacement of 4·7mm., and as 2mm. can be read with accuracy the tractive force may be determined within about 0·5kg. per ton of rolling weight. Prolonging the tube *ab* would enable a greater degree of accuracy to be obtained, but the apparatus would then become too unwieldly. In addition it would be useless, as, in the first place, too extreme a degree of accuracy is useless for practical purposes, and secondly, it would be illusory, owing to the error due to the tipping of the car.

A much more convenient form of apparatus would be a bent spirit-level. As the water-level tube only indicates an angle of inclination, this might be shown by the air bubble in an equally bent level. But though I have had half-a-dozen made I did not succeed in getting one to give anything like the accuracy of the apparatus shown in Fig. 2.

I have tested the apparatus on one of the Berlin tramways and on the high-speed line of Siemens and Halske in Lichterfelde. The amount of damping down produced by the narrow tube *l* (bore 3mm.) proved to be adequate in cases of starting and ordinary braking but too powerful for examining the effect of the emergency brake. It would be advisable to enlarge this tube and to employ a throttle-valve to regulate the amount of damping required. For ordinary street trams the apparatus gave a traction coefficient of 12kg. per ton which rose to 20kg. on a sharp curve. On the high-speed railway the apparatus was arranged inside a car destined for the Berlin overhead railway, and gave an acceleration pressure of 75kg. As the under carriage is double-bogied, and the centre of gravity lies low, appreciable tipping can hardly occur, and an error on that account is not likely. The coming-to-rest experiments were carried out on a 0·3 per cent. track. Out of six double experiments (12 readings) and speeds varying from 13·5km. to 30·7km. per hour, the traction coefficient varied between the narrow limits of 8·0 and 8·1 per ton. The day was calm. It appears, consequently, that air resistance has not much influence on speeds up to 30km. per hour. The increase in the coefficient caused by a curve of 200m. radius amounted to 1·5kg. The car was quite new, and had not run long enough to ease the parts, and after the experiments it was found that one of the brake-blocks was warm, which may account for the high coefficient of 8kg.

ALTERNATING-CURRENT INDUCTION MOTORS.*

BY A. C. EBORALL.

In the following Paper some practical points connected with the construction, design, and performance of modern single and polyphase induction motors are first considered, and then follows a brief consideration of some recent developments in this branch of electrical engineering. The author originally intended to submit a short Paper on starting devices for single-phase motors, but it afterwards occurred to him that it might prove of interest to bring up the whole question of alternating-current induction motors for discussion, as the subject is of considerable interest to many, and has been somewhat neglected in this country up to the present. On the other hand, some apology is needed for presenting such a Paper to the Institution, because there is little that is really new in this branch of electro-technics.

PART I.—THE CONSTRUCTION OF INDUCTION MOTORS.

A. *Ironwork.*—The design of the ironwork, that is, of the stator and rotor cores, motor case, bearings, &c., is the same for all motors, single or polyphase, because a single-phase motor is practically a polyphase motor running on one phase.† The general design of all induction motors with regard to the case and bearings is fairly uniform with all makers. Up to 100 H.P., and for pressures not exceeding 1,000 volts, all standard motors are semi-enclosed, the stator core-discs being built up inside a cast-iron case, and the bearings carried on open end shields. Thus the motors are virtually without bed-plates. Bearings are always provided with ring or chain oilers, and the sleeves are of gunmetal for the small sizes and of Babbitt metal for the larger sizes. Shafts are frequently case-hardened in the neck and afterwards ground true. For larger motors than 100 H.P., and for voltages above 1,000, a more open construction is employed, involving the use of a bed-plate, to which the stator case and the pedestals are bolted. In this case the bearings are usually spherical. With large motors, great care has to be taken to keep the bearings absolutely rigid with regard to the stator case, on account of the relatively small air-gap. For instance, for a 300 H.P. induction motor running at 200 revs. per min., at 40 cycles, the diameter of the rotor works out to be about 8ft., and the air-gap (iron to iron) would not exceed 0·2in. With such a motor it is absolutely necessary to stiffen the pedestals by means of arms radiating from them and bolted to the stator case. Stator stampings are usually not less than 20mm. in thickness, and are built up with or without insulation between them. Ventilating ducts are usually provided in the core for all sizes above 30 H.P. Rotors are built up from stouter stampings, which need never be insulated; ventilating ducts in them need not be provided for motors less than 50 H.P., on account of the absence of iron loss in the cores of any appreciable amount. The windings for both stator and rotor must always be iron-clad; that is, the cores must be provided with holes or slots. In Fig. 1 are illustrated some typical forms of stator holes and slots. The form marked A is the well-known Brown rectangular hole; that marked B is used by Messrs. Kolben & Co.; that marked C is the usual shape used in Germany; those marked D and E are American forms; while finally, the slot marked F is generally used in the motors built by the author's firm. The greatest winding space is given with square-topped slots. The bottom of a slot or hole is best kept rounded, as it produces a more even pole.

The arguments for and against the use of holes and slots are as follows: With the employment of a hole-winding, the magnetising current of the motor is reduced to a minimum, because the inner periphery of the stator is smooth all round, and consequently the area of the air-gap is as large as possible. But if the small iron bridges at the bottom of the holes are more than mere shreds of metal, of the thickness of paper, there is considerable magnetic leakage across them, which may greatly affect the performance of the motor. In order to prevent this leakage, not only have the stator core discs to be tooled after being built up, that is, a cut has to be taken off the bore of the stator, but the interior of the holes has to be filed, and so the ironlosses are unavoidably increased. A hole-winding produces a somewhat smoother pole than a slot-winding, but the former is much more difficult to wind, and the conductors are liable to get injured owing to

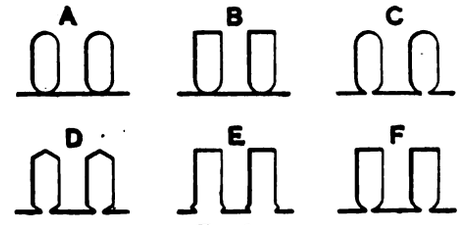

FIG. 1.

abrasion of the insulation while being pulled through, especially as the holes get nearly filled up with wires, and this injury may easily escape detection at the time. The only real objection to partly closed slots is the increase of magnetising current produced by their use (it will generally increase 10–15 per cent.), but in the author's opinion this objection is far outweighed by the smaller iron loss and greater convenience attained with slot-windings. In many American motors the slots are quite straight, as shown—that is, their sides are parallel; this permits the use of former wound stator coils, which is an advantage; but, on the other hand, the magnetising current of such motors is relatively very high. A hole-winding is open to another objection—unless a great many experimental data are available it is impossible to calculate the motor in question accurately, as magnetic leakage cannot be estimated with any accuracy. On the other hand, the performance of a motor having open or partly-closed slots can be accurately predetermined from the drawings, by means of suitable vector diagrams, such as those of Heyland* or Rothbert.

With regard to the relative proportioning of stator and rotor holes or slots, the lengths of these should not, if possible, exceed two and a-half times the width, and the nearer they approximate to square or circular shape, the better. This amounts to saying that the winding depth must be kept down, as otherwise the power-factor and the over-load capacity of the motor will be affected. The performance of a motor at starting, particularly if it has a permanently short-circuited rotor, and especially if single-phase, may be greatly improved by so designing the rotor that the slots or holes of the latter are not parallel to the holes or slots of the stator—for instance, they may be "staggered" by an amount not exceeding their pitch. This constructional feature, first put forward by Mr. C. E. L. Brown about six years ago, is used with all the induction motors built by the author's firm, including the Heyland single-phase motors, as the results of many tests show it to be of con-

* Paper read before the Institution of Electrical Engineers.

† While this is perfectly true, and although the general constructional lines are similar in each case, it must be borne in mind that far greater care has to be taken with the design of a single-phase motor than with that of a polyphaser if the best results are to be obtained. The bad effects of magnetic leakage are felt far more with the former than with the latter, and the performance of the motor is affected by apparently insignificant details of design. However, a very good polyphase motor will make a fairly good single-phase motor as a general rule.

* Refer to "Polyphase Electric Currents" (Dr. Thompson), 2nd edition, 1900; or to Mr. Heyland's latest publication, "Experimentellen Untersuchungen an Induktionsmotoren," 1900 (published by F. Enke, Stuttgart).

Digitized by Google

siderable value. The insulation of holes or slots is usually effected by means of insulating tubes of compressed paper, fibre, veneer board, or micanite, the latter material being of course best, but not necessary for low-tension motors.

The building-up of the stator core in the motor case is an important feature of the design, and, moreover, the details connected with it are frequently neglected. First, the stator core-discs should always be supported away from the case, and secondly, after having been assembled together, the stampings should not be tooled.* It is frequently difficult to avoid this after-tooling, more especially on account of the absolute necessity of having everything concentric, and therefore the author thinks it may be of interest to describe one method employed by his firm, as it has been found to give excellent results from all points of view; the method described is somewhat modified for large motors. The stator core-discs are first stamped out of the sheet-metal as exactly as possible (with modern American tools great accuracy can be attained), and then built up on an iron mandrel. After this, the end rings *r r* (Fig. 2) are riveted on, the whole arrangement put in the lathe, and the four projections on the rings *a a* turned down to the right diameter, but left a trifle full. The case of the motor, already turned on the faces *b b*, is now heated, and pushed over the core in this condition, so that after cooling, the shrinkage of the case holds the core tightly and securely. But to make everything absolutely certain, two or three screws *s* fix the case and the core positively. After the core is fixed in

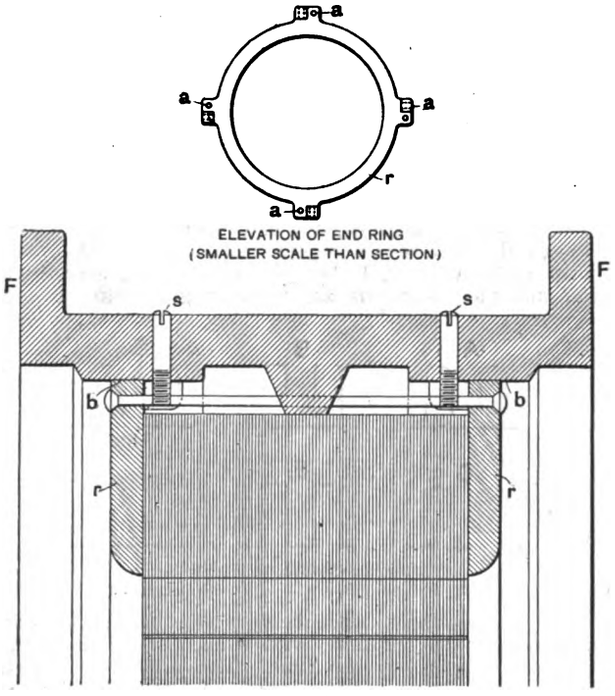

FIG. 2.

the case, the flanges on the latter, F F, are turned down, and must be, therefore, absolutely concentric and true with the stator bore, and true with the axis of the latter. Finally, the slots and end rings are heavily insulated, and the winding put in. The rotor cores are built up in the ordinary manner on the shaft, or on a spider, and are then put in the lathe, and the finest possible cut taken off them. In some cases even this cut is omitted, any slight irregularity or burr being removed by grinding. The method of building the core into possess several advantages. These are, firstly, that owing to the core being supported away from the case, leakage through the latter is minimised, and consequently wasteful eddy currents and other detrimental effects are avoided, and moreover a free circulation of air can take place all round the core; secondly, the eddy current losses in the core and teeth are reduced to a minimum, and approximate very closely to the value obtained by calculation; and thirdly, as the core discs are built up quite independently of the motor case, the width of core can be adjusted within certain limits to suit the output of the motor—a great advantage in practice, as it allows a given case to be used for motors of several sizes, and to a certain extent permits convenient variations to be made from standard designs. It is usual with some constructors, notably with Mr. Kolben, to make the end rings or cheeks of the stator cores of brass or gun metal. It is claimed that by doing this the leakage from pole to pole along the side flanks of the stator is sensibly diminished, or prevented altogether.

B. *Windings.*—The stator and rotor windings of all modern induction motors are always of the drum type, these windings consisting in all cases either of simple rectangular coils, or regular bar-windings, or modifications of the latter—for instance, the so-called squirrel-cage windings. A ring winding has three great disadvantages: firstly, it has an inherently large leakage coefficient, and secondly, its use necessitates the employment of a massive brass frame around the stator core (in order to minimise magnetic leakage) and it practically precludes the use of an external iron containing-case for the stator, thus making the mechanical construction of the motor difficult and expensive; and thirdly, there is much idle wire. As already stated, the stator coils of all motors are wound either in holes or slots, and for all usual sizes of motor these coils can be wire-wound with rectangular coils. With single and two-phase motors employing wire or cable-wound rectangular coils, there will be two ranges of coils, one range consisting of simple rectangular coils with straight ends, the other range consisting of precisely similar coils, but with bent ends. Thus each phase of the motor (with single-phasers the starting coils, occupying not more than one-third of the total winding space, may be regarded as the second phase of the motor) will be made up of coils of definite shape, the coils of one phase being bent, at the ends, up and over the coils of the other phase, in order to clear them; from this arises the workshop terms of the "straight phase" and the "bent phase," as applied to two-phase and single-phase motors. With the latter type of motor, the starting phase is invariably the bent phase, from motives of convenience in winding. With two-phase and single-phase motors, it is usual to wind all the poles; that is, considering one-phase only, the coils of this will be wound alternately right and left-handed with regard to the direction of the current in them, that is, they will be cross-connected in the usual manner. It is clear that for three phase stators having rectangular coils, it would be a great practical advantage if they could also be arranged for two sets of coils, as with three sets the

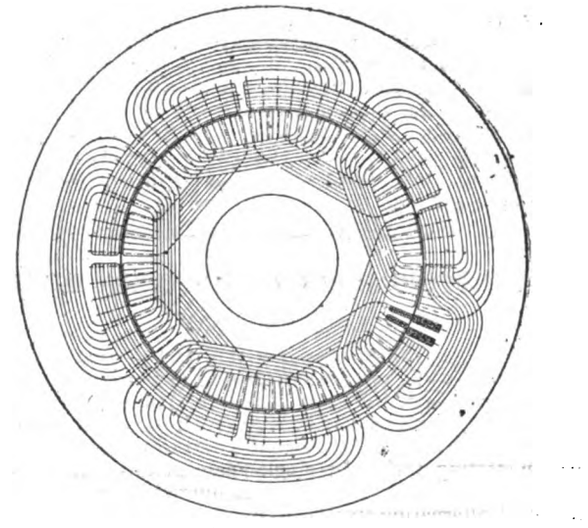

FIG. 3.

crossings of the phases at the ends are not only a source of danger (from the insulation point of view), but prevent damaged coils from being easily repaired. Moreover, if each set is in a different plane, there is no possibility of removing the rotor without removing the "bent down" coils, unless the stator core is built up in sections—a quite inadmissible construction. Consequently, for all three-phase stators for motors of standard sizes, and for all high-tension motors, the coils of the various phases are always arranged in two sets, just as for two-phase motors, the coils of a given phase being alternately bent and straight. But in order to do this, and at the same time preserve the proper phase-relation and pitch of the coils, an important modification of the winding has to be made, namely, only poles of the same sign are wound, in each phase. For instance, considering one phase only, there will be as many coils as there are *pairs of poles*, and all coils will be precisely similar with regard to the direction of winding and to the manner of connecting them up. This winding, which simply leaves each alternate pole unwound and doubles the number of turns on the wound poles, is obviously equivalent to the winding referred to above, both electrically and mechanically, but somewhat more copper is required with it, on account of the mean length of turn being greater. It is worthy of note that with such three-phase windings for stators having an odd number of pairs of poles, the winding becomes slightly unsymmetrical at one point, where the end connections of the phases cross one another. This can be readily seen from an inspection of Fig. 3, which shows a six-pole stator. Although for high tension motors, and for very large low-tension motors, this may be an inconvenience, it is not found to present disadvantages in practice for motors of standard sizes and voltages. As a general rule, too, the speeds of high-tension motors can be so chosen

* See, however, previous remarks regarding hole-windings.

Digitized by Google

that the number of pairs of poles required is even, while for the large low-tension motors, having an uneven number of pole pairs with bar-windings, it is perfectly safe and allowable to wind the stator with three ranges of coils, the end connector being bent up and back as shown in Fig. 4. Or, should this mode of construction be deemed inadvisable, on account of space for the end connections being limited, or for other reasons, the stator for such large motors can be conveniently and effectively wound with a closed bar-winding. Such a bar-winding, drawn out schematically for a two-phase motor, is shown in Fig. 5, the four-pole case being taken for simplicity. Standard three-phase stators wound with rectangular coils invariably have the coils connected star fashion. Stator bar-windings for large low-tension motors can be, and very frequently are, used with the mesh connection. Combinations of star and mesh are rarely or never found with modern three-phase motors. The number of holes or slots per stator pole per phase has an important bearing upon the design of all induction motors. In order to keep the winding depth down, and to produce an even pole, this number is best made as high as possible—in practice it

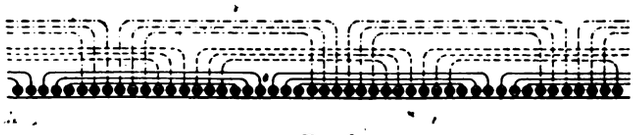

Fig. 4.

varies between four and eight. As is well known, with small motors, having squirrel cage rotor-windings, the number of stator holes or slots should be preferably prime to the number of rotor holes or slots, the latter being, if possible, more numerous than the former, as this tends to prevent a cogging acting action taking place between the stator and rotor fields. The point is, however, of small importance when wound rotors are used. Rotor windings for all induction motors are of two kinds, namely, permanently short-circuited rotors, and rotors having the ends of the windings brought to slip-rings for the purpose of inserting a resistance into the winding at starting. The design and arrangement of these rotors is independent of the number of phases and of the stator voltage, a given rotor serving for a single, two, or three-phase motor, provided that, if slip-rings are used, the number of stator poles is the same in each case, and that the flux per pole in the gap has the same value. There appears to be some difference

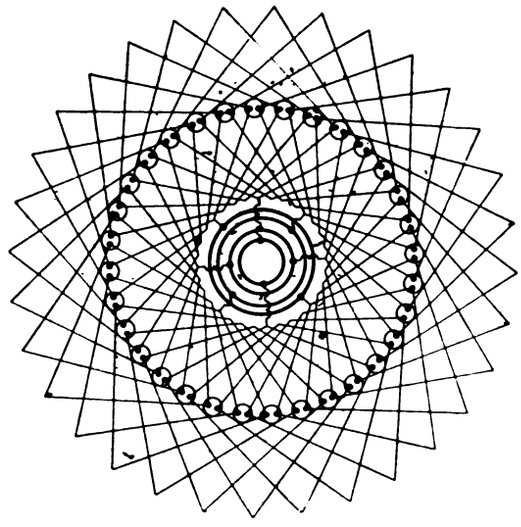

Fig. 5.

of opinion as to how far the permanently short-circuited rotor can be used with satisfactory results—that is, at what output of motor it is best to bring in the starting resistance. For motors having to start against load (apart from crane, elevator, and mining motors), the author is decidedly of opinion that the squirrel-cage construction, or its modifications, should be left behind with all polyphase motors above 5 B.H.P. With single-phase motors, which are usually arranged to start up light, wound rotors with slip-rings should be used after 7½ B.H.P. With the Heyland single-phase motors, referred to at length later on, a starting resistance in the rotor is used for all sizes. If the use of the permanently short-circuited rotor is pushed too far, the pressure regulation of the system, whatever the number of phases, is greatly impaired, owing to the excessive current consumption during the starting up of the motors. When it is considered that the best polyphase motors with squirrel-cage rotors, and starting under full load, require a momentary rush of current equal to at least two and a-half times the full-load current, this statement will be readily believed. It must not be forgotten in this connection, that under such circumstances, the power factor at the moment of starting will be low, with the result that the drop on the transformers, and perhaps even on the generators, is still further increased.

(To be continued.)

CORRESPONDENCE.

DAMAGE TO CABLES BY THE RECENT STORMS.

TO THE EDITOR OF THE ELECTRICIAN.

Sir: On the 3rd inst. this district experienced the most severe storm known for 18 years. Amongst other damage done, a length of some 40ft. of the wall of our new works was washed away into a clay pit near. The cables supplying current to our foundries for both light and power were supported by this wall, and we enclose a photograph showing the damage done. This photo is particularly interesting at this time, when opinions are divided as to the best form of protection for cables. Simplex enamelled steel conduit was the protection used, and when the stress of the débris came upon the tubes they opened at the joints, and the cables were uninjured, motors giving some 50 H.P. running without interruption. We do not hold a brief for the Simplex Co., but we are of opinion that, if we had employed any form of tube with screwed joints, the cables would have been broken and work in our foundry completely stopped.

We may mention that our pattern stores, which were built next the wall, were completely carried away, the patterns, shelves, roof, &c., being swept through the gap over the cables.—Yours, &c.,

For C. & A. Musker (Ltd.), (W. Arthur Ker, Manager).

Liverpool, Aug. 14, 1900.

ENCLOSED ARC LAMP PATENTS.

TO THE EDITOR OF THE ELECTRICIAN.

Sir: I have noticed with surprise the publication in your issue of the 10th inst. of a letter from the secretary of the Jandus Arc Lamp and Electric Co. (Ltd.). The letter has been interpreted by some of my customers and friends as a threatening one, and as such is calculated to injure my business. Mr. Gillies complains that in your publication of the discontinuance of their action against me you have done his company an injustice, but I have every wish to do the fullest possible justice to the Jandus Company.

In the latter part of last year the Jandus Company commenced an action against me alleging infringement of certain of their letters patent, and claiming an injunction, damages, and delivery of the lamps made in infringement. My defence was that I had not infringed their letters patent.

While the matter was before the High Court the Jandus Company repeatedly applied for extensions of time, and apparently exhausted every possible legal method of postponing the date when the action could be set down for trial, and as they failed to set down the action for trial within the extended time allowed, an order was made dismissing the action, and in addition, on June 22, the Jandus Company served a notice (a copy of which I enclose) wholly discontinuing the action.

Digitized by Google

Prior to serving the notice of discontinuance repeated efforts were made by or on behalf of the Jandus Company to induce me to accept a licence for a merely nominal consideration, or on a basis of "a union of interests." I absolutely declined to do anything that would involve my accepting, either directly or indirectly, a licence from the Jandus Company.

No proceedings in the nature of a test action or otherwise are at present pending against me; what the intentions of the Jandus Company may be in this respect, I neither know nor care.

The Jandus action against Johnson and Phillips is in no sense parallel with their abortive action against me, for I never was, and never shall be a licensee of the Jandus Company.—Yours, &c., W. J. Davy.

London, Aug. 15.

LEGAL INTELLIGENCE.

Workmen's Compensation.

At the Manchester County Court recently, before Judge Parry, a labourer named Statham applied for compensation, under the Workmen's Compensation Act, from Messrs. Galloways (Ltd.). It appeared that applicant was employed at the branch ironworks of Messrs. Galloway, at Ardwick. On Jan. 25 last he was at his work, which consisted in introducing red-hot rods, or liners, into a machine by which they were made circular in shape. While so employed an apprentice named Kirk, under whose orders he was working, called to him to "come and give him a pull." In order to get to Kirk the applicant passed near some cogwheels in motion, and his foot was crushed, and the injury he sustained would render him practically lame for life. The point for decision was whether, when the accident occurred applicant was acting within the scope of his employment. It appeared that applicant, who was a piece hand, had worked for respondents for six weeks, and his average earnings were 11s. 7d. a week. Applicant admitted that he knew Kirk had no right to ask him to do what he did.

Mr. COBBETT, for the employers, argued that an unauthorised person in the same employment could not, by giving an order, enlarge the scope of employment of the person to whom he gave such order.

In giving judgment, Judge PARRY said that the question, when a superior workman gave an order which, in relation to their work, an inferior workman knew, or ought to know, he should not obey—it being against the rules of the establishment—and injury followed obedience to the order, was the inferior workman outside the Workmen's Compensation Act? The applicant worked with an apprentice, and was bound to obey the apprentice's orders. In a general way, if Kirk, the apprentice, said "Do this," the applicant was bound to do it. He came to the conclusion, in fact, that, at the moment applicant was called and set out to obey the order, he had no idea what he was going to be asked to do, but that upon reaching the machinery and before he stepped over the low wall near the machine, he knew, or at least he ought to have known, that Kirk was meddling with machinery in motion, that Kirk ought not to have ordered him to give any assistance, and that he would be justified in disobeying Kirk's order. The man was not charged with serious and wilful misconduct, but it was said the accident did not arise out of and in the course of his employment. Judge Parry then referred to various decisions, but did not think any of the judgments given really concluded the matter. He understood the Court of Appeal to have said that if a man who knew the scope of his own employment chose to step outside it he stepped at the same time outside the provisions of the Workmen's Compensation Act. But where he was ordered by a superior to do something out of the scope of his employment the case seemed to him (the Judge) different. Supposing applicant had refused, and had pointed to the notice which was posted up, Kirk would probably have told him that the notice only applied to cleaning machinery and not to putting a breakdown in order; was he to argue the matter with Kirk? He thought not, and held that the accident arose "in the course of" his employment, and he thought also it arose "out of" his employment, because all workmen were employed to obey orders and not to argue about them. That the legislature intended such a case as this to be within their scheme of insurance no one could doubt for a moment, and he thought it was still open to him to so interpret the Act as to carry out its intention. There would therefore be judgment for applicant for 12s. a week during incapacity, and costs on scale B.

It was intimated that leave to appeal might be asked for.

At the Leeds County Court recently Judge Greenhow sat as arbitrator under the Workmen's Compensation Act in a claim made by the parents and relatives of a labourer named Briggs, aged 19, who was killed at the works of Messrs. Greenwood & Batley, Armley, near Leeds. There were no disputed facts in the action, but a claim for three years' wages at 10s. per week (being one-half the weekly wage of the deceased) was contested on the ground that the parents and brother of the deceased were not dependent upon him or his earnings within the meaning of the act. Messrs. Greenwood & Batley paid into court £10, the funeral expenses, and held that that was the limit of their liability. Evidence having been put before the judge, he held that the contention of the respondent firm had been made out, and that his finding must be for respondents. The judge ordered the £10 paid into court to be handed to the applicant (the father of the deceased). No costs being asked for by the respondents, there was no order made.

MUNICIPAL, FOREIGN & GENERAL NOTES.

Aberdeen.—In the financial estimate of the Watching and Lighting committee for the coming year the expenditure is put at £11,800, an increase of £1,955 over that of the previous year. The increase is due to the extension of electric lighting.

Alleged Theft of Telephone Wire.—At the Birmingham Police Court on Friday Wm. Smith, marine store dealer, Camden-street, Birmingham, was charged with stealing and receiving some copper-bronze wire, the property of the National Telephone Co. During the last 18 months a number of the company's employés have been engaged in taking down many miles of overhead telephone wire in Birmingham, Aston, and Small Heath, and it was alleged that the quantity named came wrongfully into the possession of the prisoner, who stated that he bought the wire. The case was adjourned until Wednesday, when Walter Fraser and Thomas Bishop were also charged with having stolen the wire. Mr. F. E. Smith, for the prosecution, said that it was not proposed to offer any evidence against Bishop, who was accordingly discharged. After hearing evidence, Smith was committed to the sessions, and also on a second charge of receiving a quantity of brass. Fraser was remanded.

Ashton-under-Lyne.—Mr. Robert Hammond has been appointed consulting engineer to report upon the present position of the electricity works. The maximum demand system of charging has been abandoned, and in future a uniform charge of 4½d. per unit will be made for current for lighting.

Aylesbury.—The District Council have petitioned the Local Government Board to allow local authorities to borrow money for electric lighting purposes for a longer period than 25 years, and to postpone the repayment of the principal for three years after borrowing.

Ayr.—Instead of erecting a separate generating station in connection with the proposed electric tramway scheme, it has been decided to accept the Electric Lighting committee's offer to supply current at 1½d. per unit for the first 200,000 units annually, and 1d. per unit above that quantity, the Lighting committee to pay the tramway department compensation at the rate of 9d. per car mile for any stoppages arising from any failure or deficiency in the supply of current. The question of the appointment of the burgh electrical engineer (Mr. A. J. Fuller) to carry out the electrical part of the undertaking is still under consideration, but the surveyor has been instructed to draw up a specification of the committee's requirements in regard to cars, and to invite tenders for 10 cars with complete electrical equipment. The car shed is to be erected at Bellesley Hill.

Ballymena (Ireland).—The Council have received a proposal from Mr. C. C. McCarthy to erect electricity supply works in the district at an estimated cost of £6,000, and a special committee has been appointed to report upon the subject at the next meeting of the Council.

Battle.—The Hastings Tramways Co. have decided to apply for a provisional order to supply electric current for public and private lighting in this district.

Benwell.—Proposals have been made by the Newcastle Tramways committee to extend their electric tramway system into Benwell, but discussion on the subject has been postponed by the District Council.

Beverley.—The Corporation have decided to apply for a provisional electric lighting order. This step has been taken on the advice of the consulting engineer (Mr. A. H. Gibbings).

Bowness.—The Council have decided, by a majority of one, to approve the modified electric tramway scheme recently submitted by the British Electric Traction Co.

Bradford.—The Markets and Fairs committee are to consider the question of lighting the Kirkgate market electrically.

The minutes of the Tramways committee presented at the Council meeting on Tuesday contained a statement with regard to the letters of Messrs. Robert W. Blackwell & Co. (Ltd.), alleging an irregularity in connection with the acceptance of tenders for electric tramway equipment (see *The Electrician* for August 10, p. 613), and with regard to the inquiry which had been made, Ald. Jowett asked whether the tenders referred to by Messrs. Blackwell & Co. had been opened at the Town Hall or elsewhere. The Mayor said that in consequence of great pressure of work the chairman of the Tramways committee (Ald. Cowgill) was unable to attend at the Town Hall, and to save time the tenders were taken on to his office by the Deputy City Surveyor, in order that they might be opened and tabulated for the next meeting of the committee. Ald. Cowgill said that, so far as he was concerned, everything had been as straightforward as possible, and he believed the committee accepted that view. He could not say when the Westgate tramway service would be running, but he expected that it would be within three months. The Listerhills service was practically finished, and an application would shortly be made to the Local Government Board to send down an inspector.

Digitized by Google

An electric lighting installation is to be provided for the engineering department of the Municipal Technical College at £594.

Buenos Ayres.—The *Review of the River Plate* announces that La Capital Tramways Co. has acquired the New and the Grand National Tramways companies, and that both systems will be converted to electric traction.

Burgess Hill.—Owing to the differences with the gas company it has been decided to establish electricity works. The principle of electric lighting has been approved by the Council, but whether the works be erected by the Council or a company has not yet been decided.

Cardiff.—The Lighting and Electrical committee resumed the discussion on Friday last regarding the differences which have arisen between members of the electrical staff. Mr. J. E. Teasdel, the deputy electrical engineer, whose name figured prominently in the discussion last week, had written explaining his position in the matter. There seems a disposition on the part of the Council to accept responsibility for their past action in connection with staff appointments at the electricity works. Further discussion on the subject has been adjourned.

A meeting of the Electrical committee was held last week for the purpose of considering tenders for steam pipes. Only one tender was submitted, but Mr. Appelbee read letters from three firms which stated that the time allowed for preparing tenders was not sufficient, consequently it was decided to invite fresh tenders. The contract is advertised in another column.

Carnarvon.—The Council recently had under discussion two rival schemes—one by a London syndicate and the other by Messrs. Bennett & Ward Thomas, of Manchester—for the erection of electricity works and the construction of electric tramways in the district. It has been decided to entertain the proposals of the London syndicate.

Carnoustie.—The Burgh Commissioners have resolved to oppose any application of a company for a provisional order, and information is being collected as to the advisability of establishing municipal electricity works.

Central London Railway and the Omnibus Companies.—In a communication to the *Financial Times*, a correspondent states that the Central London Company's receipts for the first week were £4,323 obtained mainly at the expense of the omnibus proprietors, for the London General and London Road Car Companies between them showed a loss of £2,732, and no doubt the effect was similar with regard to the numerous small combinations of 'buses which run on this hitherto lucrative route. The effect of the new competition on the existing underground lines was hardly appreciable—the District Company had a small decrease of £260, while the Metropolitan continued its series of increases. At the meeting of the London General Omnibus Co. yesterday (Thursday) the Chairman took the matter lightly, and said that the effect of the new railway on them was not great and he anticipated that it would be only temporary.

Chatteris (Cambs.).—In reply to a second communication from the North British Electric Supply Co. for support in their proposed application for a provisional order, the clerk has been instructed to inform the company that the Council favour the principle of electric lighting, and that they would be pleased to meet a representative of the company to discuss matters.

Christchurch.—As the local gas company has declined to make a reduction in the price of gas, the Lighting committee have been instructed to approach the Bournemouth and District Electric Supply Co. in order to obtain estimates for electric lighting.

Crieff (N.B.).—The Town Council have decided to apply for a provisional order and to oppose the application of the North British Electricity Supply Co.

Dalry, N.B.—The Council will oppose the application of the North British Electricity Supply Co. for a provisional order.

Dublin.—A supplemental loan of £10,400, to cover the cost of additional work in connection with the renewal of electric lighting cables, &c., is to be applied for.

Electricity in Mining.—At a meeting of the Mammoth-Collins Gold Mines, Ltd. (Arizona, U.S.A.) last week the chairman (Mr. T. A. Meates) said the company was using wood as fuel. The Government objected to wood being cut on their properties, and they must either face the necessity of burning oil or resort, as he hoped they would, to electricity. Their estimates showed that if they adopted electricity as motive power it would save at least half a dollar per ton on all the ore won from the mine. The cost of an installation was estimated at about $67,000. They hoped to be in a position to put down the machinery by the end of the year. They had acquired water rights; and arrangements were well forward for installing the machinery by at latest the early part of next year.

Electrical Power Scheme in Victoria.—A company is being promoted to acquire certain concessions to generate and supply electric current for lighting, power, and traction in Melbourne and neighbourhood. It is estimated that an initial capital expenditure of £3,000,000 will be necessary, and that ultimately about £7,000,000 will be required. Before operations can be commenced Parliamentary powers and the sanction of the various local authorities to the scheme must be obtained. The company's generating station will be at Wyndham, 11 miles from Melbourne, on the shores of Port Phillip Bay, and mains are to be taken underneath the Yarra through a tunnel. It is also intended to construct 103½ miles of electric tramway in the district not already provided with cable cars.

Friern Barnet (Herts).—The District Council has decided not to join with the other North London local authorities in promoting a joint bill in Parliament embracing electricity supply but will apply for a separate provisional electric lighting order for the district.

Glasgow.—The annual report of the electricity department for the year ended May 31 gives the gross revenue as £59,762, and the working expenditure (including depreciation) £38,181. The balance of £21,580 has been utilised as follows: Interest on loans (£15,256) and sinking fund (£6,285). The net balance of £39 has been placed to reserve. Owing to the large sums paid as interest on money borrowed for new works which are as yet unproductive, it had not been found possible to write off as large an amount in respect of depreciation as in the previous year. The new power stations at Port Dundas and Pollokshaws are in an advanced state, and the report states that about 20 miles of new feeders and 20 miles of distributing mains have been laid during the year on the north side of the Clyde, and 7 miles of feeders and 5 miles of distributing mains on the south side. The undertaking of the Kelvinside Electricity Co. passed into the hands of the Corporation in August last, and the department were now installing new plant of about 1,000 H.P. to meet the rapidly-growing demand in the west end of the city.

The Corporation possess unexhausted borrowing powers under their Gas acts, both for electricity supply and gas, of £306,565 and a bill is to be promoted next session to increase these powers from £2,000,000 to £3,000,000.

Glossop.—An agreement has been entered into with Edmundson's Electricity Corporation, who have already taken a transfer of the electric lighting order, for the transfer of the tramway order. The Council retain power to purchase the tramway undertaking at the end of seven years. The overhead trolley system is to be adopted. The line will be about 4 miles in length.

Imports of Electrical Goods into the United Kingdom.—The accounts relating to the trade and navigation of the United Kingdom show that the value of electrical goods and apparatus imported during July was £129,022, against £86,171 in the preceding month. The total for the seven months ended July 31 was £549,275.

Ironmongery and Hardware Trades Exhibition.—The first annual exhibition of these trades is being held at the Agricultural Hall, London, N., from the 15th to the 25th inst. The exhibition is mainly devoted to the ironmongery, hardware and furniture trades, and the number of electrical exhibits is, consequently, limited. The General Electric Co. have, however, a well-fitted stall, and their exhibit includes electric bells, telephones, arc and incandescent lamps, electric light fittings, cooking apparatus, &c. In addition, a portion of their space is fitted with the necessary plant to show the actual process of manufacturing the "Robertson" lamp. The Renewable Electric Lamp Co. have also an excellent display of their lamps, and Messrs. N. Burt & Co., Coupier & Cie, and Escaré and Denelle (Ltd.) show a large assortment of French and English bronzes, fittings, and art metal work. Messrs. Gent & Co., of Leicester, and James Hinks & Son also exhibit electric light fittings and sundries, and the Meyra Electric Co. have their dry battery on view. Messrs. Crossley Bros., of Openshaw, also exhibit a 19 B.H.P. (type S), and a 12 B.H.P., (type O.E.), gas engine, the latter being used for driving a dynamo for lighting their stand, and is especially suitable for electric lighting work. They also show a 2½ B.H.P. L.L. oil engine.

Light Railway.—The Board of Trade have confirmed the Bourne Valley Light Railway Order.

Luton.—The question of obtaining powers for the construction of tramways has been postponed for twelve months by the Town Council.

Maidenhead.—An inquiry was held here last week into the application of the Council to borrow £25,000 for electric lighting.

Maldon and Coombe (Surrey).—Mr. F. J. Warden-Stevens attended a recent meeting of the Electric Lighting committee to give particulars of the proposed electric lighting scheme. The surveyor has been instructed to supply information as to the number and position of the lamps in the district in order to enable the syndicate for which Mr. Warden-Stevens is acting to submit estimates.

Middlesbrough.—Electric current will be available early in October.

Molesey (Surrey).—The East and West Molesey District Council have received proposals from Callender's Cable Co. and Edmundson's Electricity Corporation for the supply of electric current in the district. Callender's Company are already erecting works in the neighbouring town of Surbiton.

Digitized by Google

Morecambe.—Plans and estimates are being prepared by the engineer and manager of the electricity works (Mr. C. F. Parkinson) for the equipment of the lines of the Morecambe Tramways Co. on the overhead trolley system.

Munich.—Electric traction on the overhead system is fast superseding the old horse-traction lines in this city. A uniform charge of 10pf. is made for a journey of any length where no change of cars is involved. The introduction of electric traction on two lines has led to a large increase in car-mileage and traffic, as shown by the following figures :—

	Line A.		Line B.	
	Car-kilometres.	Passengers.	Car-kilometres.	Passengers.
1891-95	322,124	1,190,807	342,671	1,098,163
1895-96	401,230*	1,940,962	400,299†	1,853,897
1896-97	409,021	2,009,674	569,349	2,368 686
1897-98	431,796	2,126,216	672,746	2,791,041

* Electric traction introduced July 1, 1895. † Oct. 23, 1895.

The gas, electric light, water and tramway systems are in the hands of the municipality. At Höllriegelsgereut, on the river Isar, a few miles above Munich, electric supply works, with four turbines, develop 2,000 H.P., provision being made for a further 4,000 H P. The creation of these works has called into being an entirely new industrial district, which is supplied with electric light and power. First Sendling was served, and now 21 other localities near Munich benefit by these works. The experiment of the Isar works has proved a great success, as there are now 90 undertakings, including 25 farms, supplied with light and power. In all there are 151 electric motors aggregating 1,062 H.P., and 21 motors of a total of 267 H.P. in course of erection, besides 13,500 incandescent lamps and 329 arcs for lighting. 86 miles of cables are laid.

Municipal Telephony.—The Glasgow Corporation has, it is announced, already obtained over 2,800 subscribers to their proposed municipal telephone exchange. The subscription is £5. 5s. per annum for an unlimited service.

The General Purposes committee recommend the Huddersfield Corporation to borrow £30,342 for establishing a municipal telephone exchange.

New Storage Battery Company.—A company, entitled the Akkumulatorenwerke Progress (Gesellschaft m.b.H.) with a capital of 300,000 marks, has been formed at Berlin for the purpose of manufacturing and exploiting the Pallavicini accumulator.

Paris Exhibition.—The royal commission has instituted a commercial information office, open daily from 10 a.m. to 5 p.m., for the use, without charge, of British exhibitors, visitors and members of congresses. A spacious office on the Quai d'Orsay is at the disposal of English members attending congresses. A writing room is provided for members of congresses, and information on trade matters will be given. A comprehensive set of customs tariffs, information as to transport by land and sea, books of reference, directories, &c, are available. During the congress letters and telegrams can be addressed to members as follows : Telegrams, "care of 'Britpav,' Paris"; letters, "care of Commercial Information Office, British Royal Pavilion, Quai d'Orsay."

Messrs. Henry Gaze & Sons, tourist agents, under whose auspices the Society of Chemical Industry, the Iron and Steel Institute, and other societies are visiting Paris, will answer inquiries of visitors contemplating a visit to the show. Inquiries should be addressed to Messrs. Gaze at 142, Strand, London, W.C.

Perth.—Negotiations are proceeding between the Police Commissioners and the Caledonian Railway Co. as to the supply of electric current for lighting the company's railway station.

Plymouth.—It is expected that the Compton tramway route will be electrically equipped and ready for opening by the end of the current financial year (March, 1901). The existing car shed at Prince Rock is to be extended to provide accommodation for 28 electric cars for working the Prince Rock, Compton, Hyde Park, Beaumont-road, and (if necessary) the Union-street routes.

Private Bill Legislation, 1900.—During the past session 272 private or local bills were submitted to Parliament, and of these 231 were passed and received Royal assent. Among the rejected measures were the County of London and Brush Provincial Electric Lighting, the Manchester and Liverpool Electric Express Railway, the Shannon Water Power, the Dublin Electric Lighting, the Tyneside Electric Power and the Glasgow and District Tramways bills.

Provisional Order Transfer.—It is proposed to transfer the Borough of Harwich Electric Lighting Order (1892) to the Harwich Electric Lighting and Tramways Co. (Ltd.). The Corporation reserves power to acquire the undertaking at any time within 20 years on certain conditions, and the consideration for the transfer is payment of £300 and costs to the Corporation.

Railway and Tramway Competition.—At the meeting of the Great Northern Railway Co, last week the chairman (the Right Hon. W. L. Jackson, M.P) said there was a decrease in the Yorkshire district of more than 200,000 passengers, and inquiry showed that the loss was due to the opening of electric tramways in competition with the railway at Bradford, Halifax, Homefield, and Queensborough.

Royal Assents.—Royal assent has been given to the Tramways (Ireland) Act and the Manchester Corporation Tramways Act.

Ryde.—An inquiry was held here last week into the application of the District Council to borrow £30,000 for electric lighting purposes. Mr. C. C. Hutchinson appeared in support of the application. He said that up to July, 1896, seven companies had attempted to obtain a provisional order, and afterwards the Ryde Electric Light Co.'s application was rejected by the Board of Trade owing to the opposition of the Corporation. In 1898 the Corporation themselves applied for and obtained an order from which the usual transfer clause was, however, excluded. Evidence having been given by the town clerk (Mr. C. G. Vincent) and the chairman of the Electric Lighting committee (Mr. J. I. Barton), technical details were given by Mr. E. Manville (Messrs. Kincaid, Waller and Manville), who had no doubt as to the financial success of the Corporation scheme. He thought it would be a much more expensive process to purchase the works from a company. What a company distributed in dividends was devoted by a corporation to the relief of rates. The site proposed for the generating station was in a good place for getting coal. The result of the circular sent to ratepayers as to the demand for current was, in his opinion, very satisfactory. He had never had any doubt about the scheme paying in Ryde. Mr. F. W. Randall stated that 973 persons, representing a rateable value of £11,141. 10s. (more than half of the total), had petitioned against the scheme. His association did not object to electric lighting, but they did not wish the Council to take up what they considered a more or less speculative concern, the initial expenditure in connection with which ought, they thought, to be borne by a company. Mr. Hutchinson, in reply, characterised the opposition as instigated by those wishing to see a company in Ryde. The Board of Trade granted the order without a transfer clause evidently intending that the Corporation should not be able to depute their powers.

Rhyl.—Permission to borrow £15,250 for electric lighting, and £6,750 for refuse destructor works, has been obtained by the Council.

Salford.—Thirty-four applications were received for the position of borough electrical engineer, and from these the Electric Light committee selected five, viz. :—Mr. Neville Appelbee (Cardiff), Mr. H. Parker (Wolverhampton), Mr. S. J. Watson (Bury, Lancs.), Mr. A. A. Day (Manchester), and Mr. J. Moss (Eccles). It has been decided to recommend the appointment of Mr. Appelbee.

Scarborough.—A deputation, consisting of Ald. N. Smith, the Mayor (Councillor Darley), and the ex-mayor (Councillor Pirie), has been appointed to meet the directors of the Scarborough Electric Supply Co. (Ltd.) to discuss the question of the purchase of the company's undertaking.

Ship Lighting.—The New Royal Indian marine steamer "Hardinge" has been provided with a complete electric lighting installation. In addition to the lighting, electric bells and telephones, electrically-propelled fans are employed for ventilating.

Smethwick.—A committee has been appointed to report upon the question of erecting electricity supply works and of constructing electric tramways in this district.

South Africa Telegraphs.—In the Cape Colony Budget for 1900-1901 the allowance for the maintenance of telegraphs is put at £14,500. This is an increase of £10,000 over the previous year, and includes a portion of the cost of repairs to wires destroyed during the war.

Southport.—Sanction is sought for a loan of £1,900 for lighting London, Chapel, and Eastbank-streets by arc lamps.

Stretford.—The Council have come to an arrangement with the Manchester Corporation with regard to the construction and working of electric tramways in the district. The lease of the existing and authorised tramways is to be for 21 years, the cost of buying out the Carriage Company, together with the cost of reconstruction, to be repaid to the Stretford Council by the Manchester Corporation during the period of the lease, the Corporation, in respect of electrical equipment, to pay 6 per cent. per annum on the capital outlay, the Corporation to pay all rates and maintain the tramways and electrical equipment, any dispute to be decided by the Board of Trade.

Sudbury.—The Town Council have committed themselves to an electric lighting scheme, and application is to be made to the Local Government Board for borrowing powers. The Council recently sent out 1,200 circulars to ratepayers on the electric lighting question, but only 255 replies were received. Of these 186 (representing an equivalent of about 4,000 8 c.p. lamps) were in favour of the work being carried out by the Council, 20 were neutral, and 49 against.

The "Journal."—Part No. 146 of the *Journal* of the Institution of Electrical Engineers is now ready. The list of contents is given in an advertisement.

Water-power Utilisation in Bohemia.—Electricity works are to be erected in Thurmitz, North Bohemia, by Messrs. B. Egger & Co., Vienna. Water-power will be utilised in the generation of current.

Digitized by Google

Wellingborough.—A provisional electric lighting order is to be applied for by the Council.

Weston-super-Mare.—Contracts for plant, &c., have been placed by the Weston-super-Mare and District Electric Light Co., and the work of laying mains is being proceeded with.

Worsley.—Application is to be made for a provisional electric lighting order, and inquiries are being made as to the advisability of also applying for powers to construct electric tramways.

Yeadon.—The Town Council had a conference with their consulting engineer (Mr. W. C. C. Hawtayne) on Tuesday, in regard to the electric lighting question, and eventually it was decided to take a plebiscite of householders in the compulsory area to ascertain the number of lights likely to be taken up and the whole subject will shortly be discussed at a ratepayers' meeting. Electric current would be supplied at 5d. per unit.

NEW BOOKS AND EDITIONS.

The following New Books and Editions can be obtained of the Booksellers, or direct from the Publishing Offices, 1, 2 and 3, Salisbury-court, Fleet-street, London:—

READY.

(Price 12s. 6d., by post, 13s. 3d.; Colonies, 14s.; abroad, 14s. 6d. (United States, 15s.)

"The Electrician" Electrical Trades' Directory and Handbook for 1900.—In addition to the well-known features of this Directory and Handbook (all of which have been carefully revised and brought quite up to date) a large addition has been made to the Handbook Division, including a Digest of the Law of the Telegraph and Telephone, for the use of municipalities and companies contemplating applying to the Postmaster-General for a Telephone Licence. This section of the book now includes the new model form of Licence issued by the Postmaster-General, the Telegraph Acts and Orders passed by Parliament in 1899, and other information in connection with this the latest development of electrical enterprise. The huge sheet tables of Electric Light and Power and Electric Railway and Tramway undertakings of the United Kingdom have been made quite complete. These sheets form a most complete record of electrical engineering progress in connection with electricity supply and power and traction applications. The Directory Division has been carefully extended and corrected, and is the most reliable list of firms and persons engaged in the electrical and allied industries ever compiled. A number of additional sketches of the careers of well-known electrical experts have been added to the Biographical Division, together with many new portraits. The new volume is the most complete and correct book of its kind ever published in any language.

"THE ELECTRICIAN" READING CASE.—To hold four numbers of the journal. Strongly bound, 1s. net; post free, 1s. 4d.

"LOCALISATION OF FAULTS IN ELECTRIC LIGHT MAINS."—By F. C. Raphael. Price 5s., post free. The book deals with the important subject of localising faults in electric light and power cables; and the various methods of insulation testing are here collected and discussed.

"WIRELESS TELEGRAPHY: SIGNALLING ACROSS SPACE WITHOUT WIRES BY ELECTRIC WAVES." A Review of the Work of Hertz and his Successors.—By Dr. O. J. Lodge, with a large number of illustrations, bringing this latest application of electrical science quite up to date. New and Enlarged Edition, 5s. nett. *Now ready.*

"THE CENTENARY OF THE ELECTRIC CURRENT, 1799-1899."—By Dr. J. A. Fleming. Price, paper covers, 1s. net, post free 1s. 3d.; strong cloth, s. 6d., post free.

"MOTIVE POWER AND GEARING FOR ELECTRICAL MACHINERY."—By E. Tremlett Carter, C.E., M.I.E.E. Price 12s. 6d., post free. In this comprehensive work an account is given of the scientific principles and modern practice in the use of engines for dynamo driving, not only for isolated power plants, but also for public electric lighting and power stations. The various forms of gearing in the power station and for electric motors are also dealt with; and the book contains, in addition, numerous tables giving exact data of the equipment and working of electric power stations.

"ELECTRIC LAMPS AND ELECTRIC LIGHTING," by Prof. J. A. Fleming, M.A., D.Sc., F.R.S., is handsomely bound, and full of original illustrations, designs, initials, &c. *New and Cheaper Edition*, 6s., post free.

"THE STUDENTS' GUIDE TO SUBMARINE CABLE TESTING."—A new edition of this book, by Messrs. H. K. C. Fisher and J. C. H. Darby, is now ready, price 6s. net; abroad, 6s. 3d. This work is intended to serve as a guide to operators already in the telegraph service, and to those who desire to enter that service. The great cable companies now insist that their operators and probationers shall pass certain examinations in electrical subjects. The book is very fully illustrated.

"ELECTRO-CHEMISTRY."—By Dr. G. Gore. Third Edition. Price 2s., post free.

"THE INCANDESCENT LAMP AND ITS MANUFACTURE."—By Gilbert S. Ram. Price 7s. 6d., post free. The principles underlying the manufacture of the incandescent lamp are carefully and fully dealt with in this volume.

"THE MANUFACTURE OF CARBONS FOR ALL ELECTRICAL PURPOSES."—by Francis Jehl. 10s. 6d., post free. This is a practical handbook, giving a complete description of the art of making carbons for electric lighting, electrodes, &c., with particulars of the various gas generators and furnaces used in carbonising. The work also contains particulars of the cost, &c. of erecting and working carbon works, and plans of a model factory.

"MAGNETIC INDUCTION IN IRON AND OTHER METALS."—By Prof. J. A. Ewing. Price 10s. 6d. net. *New Edition (Third) now ready.*

"ELECTRIC MOTIVE POWER," by Albion T. Snell, contains the latest information respecting the application of electric energy to mining and general power transmission purposes, in which the author has had much experience. Price 10s. 6d., post free; abroad, 11s.

"ELECTRICAL TESTING FOR TELEGRAPH ENGINEERS."—By J. Elton Young, M.I.E.E. The scope of the book aims at furnishing a fuller treatment of the subject, from the standpoint of the Telegraph Engineer, than it has hitherto received, whilst it endeavours to facilitate a thorough comprehension of the theory of testing as applied to electrical lines in general. Demy 8vo, fully illustrated. 10s. 6d., post free.

"SUBMARINE CABLE-LAYING AND REPAIRING."—By H. D. Wilkinson, M.I.E.E., &c., fully illustrated; price 12s. 6d. This work gives a detailed technical summary of modern practice in manufacturing, laying, testing, and repairing submarine telegraph cables.

"THE ART OF ELECTROLYTIC SEPARATION OF METALS."—A second issue of Dr. Gore's book is now ready, price 10s. 6d., post free. The author treats fully both the theoretical principles of the art of electrolytic separation of metals and the practical rules and details of technical application on a commercial scale. The work is adapted to the use of the manufacturer as well as the student.

"ELECTROMAGNETIC THEORY."—By Oliver Heaviside. *Vol. I.*, 12s. 6d. *Vol. II.*, 12s. 6d.

"DRUM ARMATURES AND COMMUTATORS," by Mr. F. Marten Weymouth. also ready. Price 7s. 6d., post free. Prospectus on application. This is a complete treatise on the theory and construction of drum winding, and of commutators for closed coil-armatures, together with a *résumé* of the principal points involved in their design, and an exposition of armature reactions and sparking.

"THE ALTERNATE CURRENT TRANSFORMER."—By Prof. J. A. Fleming, M.A., D.Sc., F.R.S. Vol. I.—*New Edition.* Price 12s. 6d., post free, Vol. II., price 12s. 6d., post free, is also ready.

"LABORATORY NOTES AND FORMS."—We have ready a set of 40 Elementary and Advanced Exercises for use with Electrical Engineering classes. These have been prepared by Dr. J. A. Fleming, and will be found of great service to Teachers, Demonstrators, and Students. The object of the series is the saving of the time of the Teacher and his Assistants, and to serve as a record of the work done by the Student. Each Form is supplied either singly at 4d., or 3s. 6d. per dozen net; in sets of any three, 1s. net; or the set of Twenty (Elementary or Advanced) Exercises can be obtained, price 5s. 6d. net. The complete set of Twenty Elementary and Twenty Advanced Exercises are price 10s. 6d. net; or in handy portfolio, price 12s. net; or bound in strong cloth case, price 12s. 6d. net. Strong portfolios can be had, price 1s. each.

NOW READY.—The cheaper edition of Dr. J. A. Fleming's "Electrical Laboratory Notes and Forms." These cheaper Forms have been prepared for the use of students and teachers at the Polytechnics and other Science classes throughout the country. The demand for the original set of these Notes and Forms has led to a request for a cheaper set for use at the day and evening classes at many of the technical institutes. These new Forms, which differ only from the higher-priced set in being printed on smaller and cheaper paper, and with less space for tabulated records, are issued at half the price of the original set.

"THE POTENTIOMETER AND ITS ADJUNCTS": A Universal System of Electrical Measurement.—By W. C. Fisher. Fully illustrated. Price 6s., post free.

"THE STEAM ENGINE INDICATOR AND INDICATOR DIAGRAMS."—Edited and enlarged by W. Worby Beaumont. Price 3s. 6d., post free. This work is a concise guide to the objects, construction, and use of the steam engine indicator and to the interpretation of indicator diagrams.

"THE ELECTRICIAN" PRIMERS.—In Two Volumes. Vol. I., Theory Vol. II., Practice. Price, stout paper cover, 2s. 2d. each, post free; cloth, 2s. 9d. Single Primers, 3d. each, post free.

"ELECTRICAL ENGINEERING FORMULÆ," a pocket book, by Messrs. W. Geipel and H. M. Kilgour; price 7s. 6d.; by post, 7s. 9d.; abroad, 8s. *New Edition nearly ready.*

"BIBLIOGRAPHY OF X-RAY LITERATURE AND RESEARCH."—A valuable compilation. Being an attempt to classify the data relating to X-Ray work. This work contains a quantity of general as well as special information bearing upon the whole subject of electrical discharge research. Edited by C. E. S. Phillips. Price 5s., post free.

"THE MANUFACTURE OF ELECTRIC LIGHT CARBONS."—A Practical Guide to the establishment of a Carbon Manufactory. Fully illustrated, price 1s 6d.; post free, 1s. 9d. In this work the author gives useful hints as to the manufacture of electric light carbons, including the preparation of material, firing, saturating, and coring, together with a description and estimate of cost of the plant required.

"ARMATURE WINDING OF ELECTRIC MACHINES."—By H. F. Parshall and H. M. Hobart. This work has been compiled from notes made by Mr. Parshall in his capacity as Chief Designing Engineer of the Edison and General Electric Companies of America, and is intended to serve as a working treatise on dynamo design. Large 4to, 370 pages, 140 full-page illustrations and 65 full-page tables, 30s. post free.

"TEMPERATURE COEFFICIENTS OF 'CONDUCTIVITY' COPPER." Compiled by Messrs. Clark, Forde and Taylor, consulting engineers. Strongly bound in cloth, 2s. 6d. net. Also a Sheet Table of Log. Reciprocals of Coefficients for Copper Resistances at different temperatures from 32°F. to 84·9°F. Printed on strong cardboard, 6d. net.

IN THE PRESS.

"THE ELECTRIC ARC."—By Mrs. Ayrton.

"SECONDARY BATTERIES, THEIR DESIGN AND MANUFACTURE."—By E. J. Wade.

"PRIMARY BATTERIES: THEIR CONSTRUCTION AND USE."—By W. R. Cooper.

"PRACTICAL TELEPHONY."—By Dane Sinclair and F. C. Raphael.

"'THE ELECTRICIAN' WIREMAN'S POCKET-BOOK."—Edited by F. C. Raphael. *Nearly ready.*

Digitized by Google

TRADE NOTES AND NOTICES.

[Notices for insertion under the above heading must reach the Office no later than first post Thursday morning. New Catalogues, Price Lists and similar matter should be sent early in the week.]

TENDERS INVITED.

Aberdeen Town Council invite offers for 35 tons steel tie-bars for tramway rails; also 20 tons 1in. diameter fish-bolts and nuts, as per specification, &c., which may be obtained from the engineer (Mr. Wm. Dyack). Tenders must be lodged at the burgh surveyor's office, Town House, Aberdeen, by noon of 24th inst. An advertisement contains further particulars.

Aberdeen Town Council also invite tenders for 650 tons of steel girder straight-track tramway rails, 150 tons steel girder curve track rails, and 60 tons fish plates. Specifications may be obtained from the engineer (Mr. William Dyack), Town House, Aberdeen. An advertisement contains further particulars, and tenders must be lodged at the borough surveyor's office by noon of Friday, 24th inst.

Aberdeen Electric Lighting committee invite tenders for 12 months supply of paper or fibre insulated lead-covered feeder, distributing and service cables, electricity meters and house main fuse boxes. Specification may be obtained from the city electrical engineer (Mr. J. Alex. Bell), Cotton-street, Aberdeen, and tenders must be in by 28th inst. An advertisement contains further particulars.

Aberdeen Tramways committee also invite tenders for the supply of steel poles, bases, and brackets for extensions of their overhead system of tramways. Tenders by noon 25th inst.

Southampton Guardians invite tenders for the erection and completion of electrical plant, and an installation for the lighting of the new workhouse infirmary at Shirley Warren, in accordance with the plans of the consulting engineer (Mr. J. G. W. Aldridge), 9, Victoria-street, Westminster, S.W. Plans, &c., may be inspected at the offices of either the electrical engineer or the architects (Messrs. W. H. Mitchell, Son, & Goddard), 9, Portland-street, Southampton. An advertisement contains further particulars, and tenders must be delivered at the offices of the clerk (Mr. David P. Gwillim), St. Mary-street, Southampton, by noon of Tuesday, Sept. 11.

Whitby District Council invite tenders for the supply and erection of electricity generating plant, some particulars of which are set out in an advertisement. Specification may be obtained at the offices of the consulting engineers (Messrs. Preece and Cardew), 13, Queen Anne's-gate, Westminster. Tenders, addressed to the clerk (Mr. Wm. Seaton Gray), Council's offices, Whitby, must be in before noon of Sept. 3.

Hackney (London) Electric Lighting committee invite tenders for condensing plant, cooling apparatus, pipework and valves, feed pumps, switchboard and boosters, arc lamps, meters, travelling crane, and workshop equipment. Specification, &c., may be obtained at the offices of the consulting engineer (Mr. Robert Hammond), 64, Victoria-street, Westminster, S.W., after 22nd inst, and tenders, addressed to the vestry clerk (Mr. George Grocott), Town Hall, Hackney, must be in by 4 p.m. of Sept. 12. Further particulars are given in an advertisement.

Newcastle-upon-Tyne New Tramways committee invite tenders for conduits and holes for poles. An advertisement contains further particulars, and specifications may be obtained after 17th inst. from the consulting engineer, Mr. Charles Hopkinson (Messrs. Hopkinsons and Talbot), 26, Victoria-street, London, S.W., and 29, Princess-street, Manchester. Tenders (addressed to committee) must be delivered at the office of the town clerk (Mr. Hill Motum) by noon of 31st inst.

Newcastle-on-Tyne Corporation invite tenders for constructing about 5 miles of double-track tramway. Tenders to New Tramways committee by 22nd inst.

Shipley (Yorks.) District Council invite tenders for steam and exhaust pipes, storage battery, switchboard and connections, and cables. An advertisement contains additional particulars, and specifications may be viewed (but not obtained) at the offices of the consulting engineer (Mr. Robt. C. Quin), Electricity Works, Blackpool. Tenders must be addressed to the clerk (Mr. Jno. Rhodes), and be in by 27th inst.

Cardiff Corporation invite tenders for the supply, delivery and fixing of sundry pipes, feed water heater, &c., at the Corporation electricity works. An advertisement gives further particulars, and tenders must be delivered at the offices of the town clerk (Mr. J. L. Wheatley), Town Hall, Cardiff, before Friday, 31st inst.

Nelson Corporation invite tenders for a 200kw. steam dynamo. Specifications, &c., may be obtained from the engineer (Mr. A. Allen), Gas Works, Nelson, and tenders must be sent to the town clerk (Mr. R. M. Prescott), Town Hall, Nelson, by Sept. 8. Further particulars are set out in an advertisement.

Ilford District Council invite offers from firms willing to take up "free" wiring in their district. An advertisement contains some further particulars, and applications, addressed to the clerk to the Council (Mr. John W. Benton), must be delivered before noon of 29th inst.

Hanley Electric Lighting committee invite tenders for two Lancashire boilers and fittings; water-tank, girders, and pumps; fuel economiser, with engine or motor; smoke chimney, exhaust fan, with engine, &c; feed water heater, forced draught fittings, fire bars or other appliances to boiler furnaces, and coal conveyor and bunkers. Tenders to borough engineer and surveyor before 25th inst.

Central Electric Supply Co. invite tenders for dry back marine boilers with mountings, feed and drain pipes, &c. (or, alternatively, water-tube boilers). Tenders to general manager (Mr. F. J. Walker), 19, Carnaby-street, London W., by 10 a.m. Aug. 20.

Manchester Electricity committee invite tenders for work and materials required in the erection of the electricity generating station at Bloom-street. Tenders to chairman of committee by 21st inst.

Manchester Tramways committee invite tenders for cast-iron bases for tramway poles. Specification can be obtained from the general manager (Mr. J. M. McElroy), and tenders, addressed to chairman of committee, must be in by 25th inst.

Bristol Electrical committee invite tenders for foundations, &c, at their new Avonbank electricity works. Tenders to secretary, Temple Bock, Bristol, by Sept. 4.

Salford Corporation invite tenders for the supply and erection of lighting switchboard, traction switchboard, and balancing transformer. Tenders to town clerk by Sept. 3.

London County Council Asylums committee invite tenders for boilers, engines, dynamos, &c., at Horton Estate, Epsom, Surrey. Tenders to committee, 6, Waterloo-place, S.W., by 10 a.m. of Sept. 22.

Portsmouth Corporation invite tenders for plant and apparatus for the equipment of their proposed tramway power station. Tenders to town clerk by 10 a.m. of Sept. 4.

Fulham (London) Vestry invite tenders for wiring the Town Hall. Tenders to clerk, Town Hall, Walham Green, London, S.W., by 4 p.m., 24th inst.

Worthing Corporation invite tenders for the supply and erection of electricity generating plant. Tenders to town clerk's office by noon of Sept. 3.

Plumstead (London) Vestry invite tenders for electricity generating plant. Tenders to Vestry Clerk, Vestry Hall, Maxey-road, Plumstead, S.E., by Sept. 19.

Glasgow Corporation invite tenders for the reconstruction of tramways, and the construction of new tramways. Tenders to town clerk by 24th inst.

Newport (Mon.) Guardians require tenders for the electric lighting of their new workhouse, Stow Hill. Tenders to clerk by 22nd inst.

Luton Town Council require tenders for watt and demand meters. Tenders to town clerk by Sept. 14.

Dorking District Council invite offers for leasing their provisional order. Tenders to clerk by 30th inst.

Stockport Tramways committee invite tenders for 20 double-deck tramcars with electrical equipment. Tenders to clerk by 31st inst.

Worksop Council invite tenders for the erection of electricity station buildings. Tenders by noon 27th inst.

Rochdale General Purposes committee invite tenders for wiring Town Hall. Tenders by 22nd inst.

Tenders are invited for the public lighting of *Limavady* (Ireland) from Sept. 1 to April 15. Tenders to clerk by 18th inst.

Tenders are invited until 30th inst. by *Dusseldorf* Municipal Council for two 4-ton and two 3-ton overhead electric travelling cranes. Tenders to Die Oberbürgermeister, Stadtbauamt III., Dusseldorf.

The *French Post and Telegraph authorities* invite tenders until 23rd inst. for 430 tons of bronze or copper wire. Particulars from and tenders to le Sous-Secretariat d'Etat des Postes et des Telegraphes, 103, Rue de Grenelle, Paris.

The *Roumanian Post and Telegraph authorities*, Bucharest, invite tenders until 24th inst. for 40 tons of galvanised iron wire.

TENDERS RECEIVED AND ACCEPTED.

Blackpool Corporation have accepted the following tenders for the supply of apparatus for the equipment of the Marton electric tramway:—

Leeds Steel Works, rails.
Askham Bros. and Wilson, points and crossings.
Leonard Cooper, patent jointing materials.
Lowdon Bros., trolley poles, storage battery, boosters and switchboard.
St. Helens Cable Co., cables and trolley wire.

The total amount of the tenders is about £27,000.

Larne District Council have entered into an agreement with the Larne Electric Light Works (Ltd.) for the lighting of the town for three years from the 1st inst.

Digitized by Google

Portsmouth Corporation have decided to purchase a new Parsons 500kw. turbo-alternator at £5,360, to meet the winter load of 1901.

The tender of Messrs. Shalders and Davis has been accepted by the Southampton Council for the electricity generating plant, wiring, &c., for the electric lighting of Brookwood Asylum at £5,600.

Sheffield Corporation have accepted the tender of the Electric Construction Co. for the supply of transformers for twelve months at schedule rates.

We learn that no tenders were received by the Barnes District Council for the wiring of premises in the district on the easy payment system.

APPOINTMENTS VACANT AND FILLED.

A demonstrator is required to take charge of the laboratory classes in elementary electrical engineering and physical laboratory work, &c., at the City and Guilds Technical College, Leonard-street, London, E.C. Applications to Prof. Silvanus P. Thompson.

The tramways department of the Glasgow Corporation require a first-class mechanical engineer to take charge of the steam plant and general oversight of the tramways power station. Salary £250 per annum. An advertisement gives further particulars, and applications have to be sent to Mr. John Young, general manager, 88, Renfield-street, Glasgow, by Aug. 20.

Hull Electric Lighting committee have vacancies for two electrical improvers. Applications to the Chairman of committee, Town Hall, Hull, by noon of 23rd inst. Mr. A. S. Barnard is city electrical engineer. See advertisement.

A meter reader is required at Sunderland electricity works. Applications to borough electrical engineer, Mr. J. F. C. Snell. See advertisement.

An assistant is required in the distributing engineer's department of the Charing Cross and Strand Electricity Supply Corporation (Ltd.). See advertisement.

A demonstrator and assistant lecturer in physics is required at the University College, Sheffield. Applications by 25th inst.

Mr. R. W. Liddell, Leith, has been appointed chief clerk at the Fulham (London) electricity works at £140 per annum.

BUSINESS NOTICES.

Mr. A. R. Bennett, consulting telephone engineer, has removed from 44, Manor Park, Harlesden, London, N.W., and until further notice his address will be 55, West Regent-street, Glasgow.

Messrs. W. A. Shaw and E. A. Shaw (trading as William A. Shaw & Co.), electrical engineers, Warren-street, Stockport, have dissolved partnership. Debts by Mr. W. A. Shaw.

The Renewable Electric Light Co. (Ltd.), Brunswick-place, City-road, London, N., announce that the equipment of their factory, and the preparations for the supply of renewable lamps of from 8 c.p. to 50 c.p. are now completed, and they are in a position to supply lamps in large quantities.

Though Mr. W. H. Chantrey (Messrs. Blakemore, Chantrey & Co.), 57, Moorgate-street, E.C., was recently appointed receiver and manager of the British Blahnik Arc Light Co. (Ltd.) we are informed that the works are being continued as hitherto.

BANKRUPTCIES, LIQUIDATIONS, &c.

A meeting of W. C. Bersey & Co. (Ltd.) will be held at 32, North-street, Manchester-square, London, W., on Sept. 17, to receive an account of the winding-up.

Meetings of creditors and contributories of the Gutta Percha Corporation (Ltd.) will be held on 24th inst., at 33, Carey-street, London, W.C., at 11 o'clock and 12 o'clock respectively.

The Sussmann Electric Miners' Lamp Co. (Ltd.) is to be wound up voluntarily for reconstruction purposes, and Mr. R. Warner has been appointed liquidator with authority to consent to the registration of a new company with the old name.

A meeting will be held at 17, Grey-street, Newcastle-on-Tyne, on Sept. 17, to receive an account of the winding-up of the Dargue Acetylene Gas and Electrical Co. (Ltd.).

In the bankruptcy of W. A. Charles and J. S. Blackwell (trading as the Central Electrical and Engineering Co.), 74 and 111, Church-gate, Leicester, and 22, Kennington-road, London, S.E., the trustee has been released.

Following are the principal creditors in the bankruptcy of Leonard Francis, electrical engineer, 13, Corporation-road, Southwold :—

Beanland, Perkin & Co...	£89	9 10	General Electric Co. ...	£15	0 0
A. C. Wells & Co...	73	0 0	Young and Marten	13	0 10
United Asbestos Co. ...	28	2 10			

The liabilities are £275. 13s. 7d., and assets £167. 9s.

Plant for Sale.—Messrs. Wheatley Kirk, Price & Co. announce in an advertisement the sale by public auction, at Ormonde Works, Hornchurch-road, Romford, Essex, on Tuesday and Wednesday 28th and 29th inst, of a large quantity of high-class engineering plant, machinery, shafting, loose tools and utensils, accessories, &c. Catalogues may be obtained of the liquidator, Mr. Wm. Hutton, 39, Bennett's-hill, Birmingham; of Messrs. Hargreaves & Heaton, solicitors, Waterloo-street, Birmingham; or of the auctioneers, 49, Queen Victoria-street, London, E.C., and Albert Chambers, Albert-square, Manchester. The sale commences each morning at 11 a.m.

The Derby Corporation have two 60kw. sets, an exciter set and an exciter for sale. An advertisement contains additional particulars, and further information can be had from the borough electrical engineer (Mr. T. P. Wilmshurst), Electric Light Station, Sowter-road, Derby.

Messrs. Claridge, Son and Rennie, engineering, metal and allied trades auctioneers and valuers, 5, Waterloo-street, Birmingham, have been instructed by Thomas Smith's Stamping Works to sell by auction, at 176, Aston Brook-street, Aston, Birmingham, on Thursday, 23rd inst., at 11 o'clock, a quantity of electrical plant and machinery, including 27 electric motors, some cable, switchboards, voltmeters, raw-hide pinions, stamping and engineering plant, a 32 H.P. Robey steam engine, Lancashire boiler and boiler tank, pumps, engineers' tools, &c. Further particulars are given in an advertisement.

Works for Sale.—Freehold works, suitable for electrical engineering, motor car works, &c., are advertised in another column. Particulars from Mr. Goddard, auctioneer, Wolverhampton.

Patent Amendment.—Notice is given in an advertisement that Mr. H. C. Woltereck, 25, Whiteley-street, New York, U.S.A. (at present of 82, Victoria-street, London, S.W.), has applied for leave to amend specification of letters patent No. 2,382 of 1899 for "Improvements in the Manufacture of Pigments." Notice of opposition must be given by Sept. 1.

Chapman Voltage Regulator.—Messrs. Geipel and Lange inform us that they have been appointed sole agents in this country for the Chapman voltage regulator, which has been used here for keeping the voltage constant under the conditions met with in motor installations.

Engineers' Supplies.—Messrs. Poth, Hille & Co., of Leadenhall-street, E.C., forward particulars and prices of "Empress" self-vulcanising jointing, steam packings, belting, engineers' stores, &c.

"Fast-Grip" Vices.—We have received from Messrs. George Harrison & Co., Ure Bank Engine Works, Ripon, a new catalogue of improved "fast-grip" parallel vices, for which great holding power and quickness in opening and closing are claimed to be combined. These vices are now manufactured in batches to standard gauges. The illustrations accompanying the catalogue show the method of construction and the means adopted to secure the best results with a minimum of skilled labour.

General Electric Apparatus and Material.—We referred in our issue of July 27 to the sections of the General Electric Company's complete catalogue describing multipolar motors and lift controllers and motor driven starters for presses, lathes, tools, &c. We should have mentioned that copies of these two inserts for the main catalogue can be obtained by consulting engineers and contractors free on application pending the issue of a new edition of the complete catalogue now in preparation. A new catalogue of wires and cables, conduits, cases, and wiring sundries has just been issued. Copies of this well-arranged list will be forwarded to the trade post free on request.

B.T.H. Plant.—Pamphlet No. 71, issued by the British Thomson-Houston Co., describes the Thomson tramway and portable recording wattmeters.

Tubes and Fittings.—A revised edition of the price list of wrought iron and steel tubes and fittings, trolley poles, telegraph and telephone poles, &c., manufactured by Messrs. John Spencer (Ltd.), of Wednesbury and Great St. Thomas Apostle, London, is just issued and can be obtained post free on request.

Exports of Electrical Apparatus and Material.—The following list gives official particulars of the exports of British manufactured electrical apparatus and material (including telegraph and telephone wire and material, but not including electrical instruments or machines, which are not separately specified) from Aug. 9 to Aug. 14, with the ports of destination :—

Africa—Beira, £4,510 (telegraph material); Cape Town, £252; Durban, £526; East London, £663; Port Elizabeth, £160. *Australasia*—Adelaide, £60; Fremantle, £415 (including £85 telegraph material); Launceston, £105; Melbourne, £1,206 (telegraph cable); Sydney, £968; Wellington, £253. *Brazil*—Rio Janeiro, £242 (telegraph material). *China*—Shanghai, £406. *Germany*—Hamburg, £1,450 (including £1,250 telegraph material). *Gibraltar*, £400 (telegraph material). *Holland*—Amsterdam, £60; Rotterdam, £250 (telegraph material). *Hong Kong*—£85. *India*—Bombay, £500; Calcutta, £61 (including £8 telegraph material). *Norway*—Christiania, £50 (telegraph wire). *Straits Settlements*—Singapore, £61. *Sweden*—Stockholm, £783 (telegraph material). *Turkey*—Constantinople, £45 (telegraph material). *West Indies*—Trinidad, £45. Total £13,556, against £11,887 for the corresponding six days last year (Aug. 10 to Aug. 15).

PATENT RECORD.

The following list of Applications for Patents and Specifications published has been compiled for this journal by MESSRS. J. C. CHAPMAN and Co., *Chartered Patent Agents, of 70, Chancery-lane, W.C., from whom any available information in connection with Patents, Designs, and Trade Marks may be obtained.*

APPLICATIONS FOR PATENTS.

NOTE.—*The undermentioned Applications are not open to public inspection until after the acceptance of the complete Specification. The names within parentheses are those of communicators of inventions. When complete specification accompanies application, an asterisk is affixed.*

May 30, 1900.

9,962. G. W. MONEY. London. Improvements in or relating to alternate-current induction motors.
9,971. E. JAHR. London. An improved method of utilising electrical earth currents.
9,975. R. GRISSON. London. Improvements in electrical transformers.
9,988. G. D. MONACO. London. Electric signalling device for preventing railway collisions.

May 31, 1900.

10,001. C. W. DAWSON. Leeds. An improved method and means for controlling the speed of electric motors.
10,022. M. GAUGHREN. Glasgow. Improvements in electric tramways or railways on a conduit system.
10,026. J. GARVIE. London. Electrical appliance for working pile drivers.
10,029. N. W. STORER. London. Improvements relating to the distribution of electric current. (Date applied for under Patents, &c., Act, 1883, sec. 103, Nov. 1, 1899, being date of application in United States.)
10,031. E. W. BOHLE and H. BOHLE. Birmingham. Improvements in arc lamps and in the manufacture of the same.
10,074. F. C. NEWELL. London. Improvements in electric brakes.
10,075. J. W. MARTIN. Liverpool. Improvements in or in connection with trolley or like current collectors for electric railways and tramways.
10,081. I. KITSEE. London. Electric fuse.

June 1, 1900.

10,121. C. ADAMS-RANDALL. London. Improvements in electrically-propelled velocipedes, carriages, and other like vehicles.
10,124. J. E. KINGSBURY. London. Calling appliances for telephone switchboards. (The Western Electric Co., United States.)
10,133. T. DUNCAN. London. Improvements in and relating to electric meters.*
10,134. T. DUNCAN. London. Improvements in electric meters.*
10,137. R. KRAYN. London. Improvements in or connected with electric lamps.*
10,141. G. B. BOWELL. London. Improvements in or relating to electric switches.
10,142. D. MURRAY. London. Improvements in printing telegraph apparatus.*

June 2, 1900.

10,172. T. PREECE. Blackburn. Improvements in apparatus for starting and controlling electric motors.
10,181. C. E. GRIFFING. Glasgow. Electrical steam boiler.*
10,197. K. A. WILDE. London. Improvements in electrodes.
10,210. E. G. DAHL. London. Improved electrical apparatus for closing steam supply valves from a distance and giving an audible signal.*
10,214. J. A. MCMULLEN. London. Improvements relating to electrical ignition devices applicable to internal-combustion and like engines and to other purposes.
10,219. W. L. WISE. London. Improvements in electricity meters* (Lux'sche Industriewerke Actiengesellschaft, Germany.)*
10,221. E. CHADWICK. London. Electrical alarm for automatic fire-extinguishing sprinkler installations. (H. Tetlow, Russia.)
10,230. L. BACHELIN. London. An improved arrangement of underground mercury contact for electric railways and tramways.

June 5, 1900.

10,270. G. EVANS. South Wales. Improved low-tension exploder or electric shot-firing battery.
10,273. H. J. HADDAN. London. Improvements in controller regulators for electric motors. (The Garton Daniels Co., United States of America.)*
10,312. C. E. WILSON. London. Improvements in and connected with wireless telegraphy.*
10,318. J. C. FELL. London. Improvements in electric storage batteries and conducting plates therefor. (S. L. Wiegand, United States.)*
10,319. J. C. FELL. London. Improvements in electric storage batteries. (S. L. Wiegand, United States.)*
10,323. H. CASSIBER. London. Improvements in telephone cables and in apparatus for producing same.*
10,326. B. SHAW. London. Improvements in or relating to electrical stop-gear for steam and other engines or machinery.

June 6, 1900.

10,348. J. V. D. PLOEG. Glasgow. Electro-magnetic machine.*
10,357. J. J. HYNES and P. M. RANDALL. London. Improvements in and relating to electrical apparatus for surgical and other purposes.*
10,361. J. A. HALFORD. London. An improved flexible electrical conductor from any point of which a current may be taken.
10,362. J. A. HALFORD. London. Improvements in caps for glow lamps.
10,363. J. A. HALFORD. London. Improvements in electric contacts.
10,375. J. GARASSINO. London. Improvements in the construction of plates for accumulators or secondary batteries discharging heavy currents.

June 7, 1900.

10,423. S. F. EDGE and F. WILLS. London. Improvements relating to electric ignition devices for internal combustion or explosion engines.
10,437. A. MACKENZIE. London. Improvements in or relating to electrodes for batteries.
10,444. G. PATROUILLEAU. London. Improvements in or connected with electric incandescent lamps of the refractory conductor type.*

June 8, 1900.

10,451. A. H. MAYES. Hove. A containing box for electrical resistance material.
10,460. A. RIED. Liverpool. Improvements in or connected with electric cars.
10,476. A. BRAUN (trading as A. Braun & Co. and the Erste Osterreichische Motor-Fahrzeuge-Fabrik). London. An improved adjustable electric igniter or spark producer.*
10,498. W. R. RIDINGS and VERITYS LIMITED. London. Improvements in switches.
10,502. G. RITTER. Liverpool. Improvements in telephone systems.*
10,509. N. N. HAIGH and B. SHORE. London. Improvements in electrical switches.
10,511. THE ELECTRICAL POWER STORAGE CO. (LTD.), H. W. BUTLER, and J. H. MAY. London. Improvements in the manufacture of negative or spongy lead plates, or elements for secondary batteries or electrical accumulators.

June 9, 1900.

10,542. H. OPPENHEIMER. London. Improvements in and connected with electric wall plugs. (Actiengesellschaft Mix & Genest, Germany.)
10,543. H. OPPENHEIMER. London. Arrangement for limiting the length of the fuse of electric cutouts. (Actiengesellschaft Mix & Genest, Germany.)
10,544. H. OPPENHEIMER. London. Improvements in and connected with quick-break switches. (Actiengesellschaft Mix & Genest, Germany.)
10,545. H. OPPENHEIMER. London. Improvements in and connected with switches or keys for electric lampholders. (Actiengesellschaft Mix & Genest, Germany.)
10,550. W. E. EVANS. London. Improvements in and relating to ammeters. (Gaus & Goldschmidt, Germany.)
10,579. SIEMENS BROS. & CO. (LTD.). London. Improvements in and relating to electrically-controlled apparatus for shifting and locking railway points. (Siemens & Halske Actien Gesellschaft, Germany.)*
10,580. O. IMRAY. London. Improvements in electric furnaces of great power. (F. Morani, Italy.)
10,587. W. H. ARUNDELL. London. Improvements in feeding and regulating mechanism for electric arc lamps.

June 11, 1900.

10,606. A. D. SMITH. Bradford. Improvements in electrical fuse boxes.
10,612. F. W. MARTIN, F. STEWART, J. M. BROWN, and N. G. BOGGS. Canada. Improvements in arc lamps.
10,616. L. D. TILLYER and E. D. TILLYER. London. Electric bell striking apparatus. (Date applied for under Patents, &c. Act, 1883, sec. 103, Nov. 17, 1899, being date of application in United States.)
10,638. W. P. THOMPSON. London. Improvements in or appertaining to motor starters. (The Fraser Electric Elevator Co., United States.)
10,639. W. P. THOMPSON. London. Improvements in or appertaining to controllers. (The Fraser Electric Elevator Co., United States.)

SPECIFICATIONS PUBLISHED.

NOTE.—All Specifications can now be obtained at the uniform price of 8d. each.

1899.

11,172. VERITYS LIMITED and STEELE. Apparatus for controlling electric currents especially applicable for charging secondary batteries or accumulators.
11,506. FLEMING. Carbons for electric arc lamps.
12,789. WEINMAR. Telephone systems.
13,280. SMITH. Channel rails and current supply for electric tramways.
14,033. DUNN and BROMHEAD. Means for constructing a thermopile and for utilising solar rays and other energy for the purpose of generating, transmitting, storing, and using thermo-electricity.
14,235. HOEFT. Apparatus for measuring time by electricity.
14,569. SAYERS. Dynamos.
15,135. HOLLINS and LEAKE. Electrical clock arrangement and apparatus.
15,178. CHAPLIN. Brushes of dynamos.
15,440. VON RECKLINGHAUSEN, VOGT and NERNST ELECTRIC LIGHT (LTD.). Electric incandescent lamps.
15,644. KÜPPER and VORREITER. Electrical ignition apparatus.
15,720. CROMPTON & CO. (LTD.), HODGSON and TUBBS. Electrical arc lamps.
18,870. BOULT (Jungbluth). Manufacture of electrical insulating material.
10,682. ANDREWS. Telephonic appliances.
10,697. LE ROND. Rotary engines for continuous current applicable either as a motor or as a pump for gas vapour or liquids. (Date applied for under International Convention, Oct. 22, 1898.)
10,903. WISE (Crehore and Squier). Telegraphic transmitters and receivers.
11,345. FRIESE-GREENE and KNELL. Cartridges to be fixed by electrici

COMPANIES' MEETINGS AND REPORTS.

Chili Telephone Co. (Ltd.).

The eleventh ordinary general meeting was held on Friday last, Mr. GEORGE KEITH presiding.

The SECRETARY (Mr. Edmund Petley) read the notice calling the meeting, and the report of the Directors and the accounts were taken as read.

The CHAIRMAN said: Gentlemen, our business in Chili has improved very considerably during the past year. The gross revenue has increased by $51,442, and the total expenses have been reduced by $10,681. The decrease in the expenses is certainly very satisfactory, more especially as the first half of the year was not favourable for economical working. The unprecedented storms and inundations which took place in Chili last winter—that is, our summer here—did great damage all over the country, and made the maintenance of our service both difficult and expensive. The decrease now shown in the expenses was effected during the second half of the year, and was accompanied with a large increase of revenue. The exchange was also in our favour. The mean rate for the previous year was 14¼d., and for the past year it was 15⅛d. With these improvements the income in Chili amounts to £18,130, showing an increase for the year of £4,764. The London expenses and charges remain practically unaltered, with the exception of the item in connection with the debenture issue. The bonds falling due on March 31 last year were renewed on the same terms and conditions for five years until March 31, 1904, and the cost of doing this, amounting to £347, now appears amongst the expenses of the year. The debenture issue remains unaltered at £56,000, and there is no change in the interest payable. The result of the year's business is that after deducting all expenses and charges and adding transfer fees and the amount brought forward from the preceding year, we have a credit balance of £12,847. Of this amount the Directors have placed £3,044 to reserve, and recommend a dividend for the year of 4 per cent., free of tax, absorbing £8,800, and carrying forward £1,003. All things considered I think you will agree that the result is very satisfactory. Much uncertainty existed during the year as to whether Chili would issue more paper money and give up the metallic conversion of the currency, the suspension of which was brought about by the monetary crisis of 1898. This had the effect of keeping down the exchange at which the profits of the year were remitted to this country. Fortunately, towards the end of the year the situation improved. Chili is now adhering to a sound money policy, and there is every prospect that the law of July 28, 1898, will be duly carried out, re-establishing in 1902 the gold currency with the value of the dollar at 18d. The exchange has lately been very firm and now stands at 17¼d., and our sterling profits for the same number of dollars are now much better than they were last year. As regards the plant, the capital outlay for the past year amounts to £1,798 expended on erecting and equipping new lines. Some considerable alterations have now become necessary in order to maintain the efficiency of our service at Santiago, which will increase our expenditure there for some time to come. Otherwise our plant as a whole is in very good order and requires no exceptional expenditure to be incurred upon it. As regards the management in Chili, you may be interested to know that a change has taken place during the past year. In October our former manager, being desirous to return home, resigned. Since then Mr. Antonio Huneeus, who was for some years connected with our business as legal adviser at Santiago, has been our representative, and arranging most successfully for us all matters affecting the interests of the Company; and Mr. William Johnston, our new general superintendent, has been in entire charge of the staff and practical working of the business. I have great pleasure in expressing our appreciation of the able and successful services which these gentlemen are rendering the Company. Altogether our business is in good form, and the present year, as far as it has gone, is showing very good results. I now move the adoption of the report and accounts.

The motion was carried unanimously without discussion.

A resolution approving the dividend was also carried.

Mr. J. R. BAILLIE said that he would like to ask whether the Company made any alteration as regarded the rates that they charged for subscribers to the telephone, in order to compensate for the fall in exchange, or whether they charged a permanent figure; whether, for instance, the subscribers in Valparaiso were only charged a fixed annual amount? He felt that the subscribers ought to pay more when there was a depreciated exchange in order to recoup the Company, because other business people made alterations in the prices under different circumstances to fit in with the fluctuations of the exchange, which affected the price of copper and nitrate and the various other products of Chili.

The CHAIRMAN pointed out that the Company dealt with people many of whom were not much affected by the question of the fluctuations in the rate of exchange. It was a matter which really only affected remittances between Chili and England. The people there looked upon a dollar as a dollar. If they charged a subscriber say $120 when they had only been in the habit of charging him $100, he would say that they had raised the price of the service, whether it was due to the fall of exchange or not.

Mr. George Keith was then re-elected a Director, the auditor was re-appointed, and a cordial vote of thanks to the Chairman and Directors terminated the proceedings.

LIVERPOOL OVERHEAD RAILWAY CO.—The half-yearly meeting was held at Liverpool on Tuesday. The chairman (Sir W. B. Forwood) congratulated the shareholders upon the satisfactory half-year's work. The overhead railway had, he said, been in operation for seven years, and they had steadily built up their prosperity until they had placed the company upon a permanent basis. They had done a great deal for the trade of the port, and had given increased facilities for moving about the docks and removing the congestion of the streets. They had carried 58,000,000 passengers, and their trains had run 5,000,000 miles, and this without any serious accident. During the past half-year they had earned £38,021, against £36,492 in the corresponding half of last year. They had spent £25,113, against £24,924. The proportion of expenditure to revenue was 61·71 per cent., against last year's 64·44 per cent. Now they carried forward to their net revenue account £12,909. From last half-year's account they had brought forward only £4,591. The balance they had to deal with was £17,602, and after paying debenture interest (£3,400) £14,202 was available to pay the dividend on the 5 per cent. preference shares, absorbing £3,000, and at the rate of 3 per cent. per annum on the ordinary shares, which would amount to £6,750. The balance forward to next half-year was £4,452, against £4,320. 8s. 3d. He felt he could congratulate the shareholders upon their being one of the three railway companies who had been able so far to pay an increased dividend for the past half-year. They had carried an increased sum to reserve for the renewal of boilers, machinery at the generating station, permanent way, &c., of £1,500, against £1,300. Their expenditure had increased a little on running and traffic expenses by the increased mileage they had run of 14,500. The increased cost of coal had not been felt during the past half-year, owing to their having had a cheap contract, but the present contract would tell upon them, because they were paying now almost double the price. The company was still holding the record for punctuality, 97·3 of their trains having during the past half-year been up to time. The tramway system taken over had been opened as far as the Five Lamps at Waterloo. They had been operating on this portion of the line for four or five weeks, with very satisfactory results, both in regard to local traffic and the extent to which the tram line had fed their own railway. They hoped to extend the line to Crosby towards the end of next month. The bill which the directors had received permission to promote in Parliament had received the Royal assent, but they had had to eliminate from it the power to increase the size of the Pierhead station, as the Liverpool Corporation offered strenuous opposition in regard to that clause, and they thought it better to drop it. Their idea was to introduce shortly a 2½-minute service of trains between the Pierhead and the North-end. They thought this would give practically a movable platform to the north end of the dock system, and give greater facilities to the trade of the port. However, the Liverpool Corporation did not take the same view of the matter as the directors had done, and they had had to abandon the scheme. He was pleased to state that the batteries which they were providing for improving the lighting of their service were nearly completed, and he hoped that next winter they would have all their trains thoroughly well lighted. Their new train for accelerating their traffic by 15 minutes was nearly completed. That would be an economy to them in working expenses, for they would employ fewer trains, whilst greater facilities would be given to the traders of the port. He thought no one would have cause for complaint as to speed when they covered a distance of 6½ miles with 15 stoppages, in 20 minutes. They had also to consider a proposal for working a mineral traffic over their line at night time, and he hoped that this would take practical effect.

NEW COMPANIES, STATUTORY RETURNS, &c.

JOHNSON ELECTRO-GERMICIDE CO. (LTD.)—This company was registered on Aug. 9, with a capital of £2,000 in £1 shares, to acquire from C. M. Johnson the benefit of an invention for destroying disease germs, together with the electrical generating machine and apparatus at his research laboratory, and to carry on the business of electrical and other apparatus manufacturers, &c.

PRIESTMAN BROS. (LTD.)—This company was registered on Aug. 9, with a capital of £13,000 in £1 shares, to acquire the business of Priestman Bros., and to carry on the business of electrical and general engineers, electricians, founders, tool makers, &c. The first directors are Sir James Reckitt, Bart., I. Milner, C. Wardlow, G. V. Maxted, E. Hanger, and J. R. Whamond.

SPENCER AND COOK (LTD.)—This company was registered on Aug. 11, with a capital of £5,000 in £1 shares (4,000 preference), to carry on the business of mechanical, electrical, and consulting engineers, boiler makers, &c. The first directors are D. R. Spencer, T. Cook, N. Spencer, W. H. Cook, and B. Goodfellow.

EDMUNDSON'S ELECTRICITY CORPORATION (LTD.)—The annual return to July 20 gives the capital as £400,000, in 80,000 shares of £5 each, 40,000 of which have been taken up. £5 has been called up and paid on each of 26,800 shares; £65,000 is considered as paid on the remaining 13,200 shares. The capital was increased from £200,000 to the present amount on the 6th ult.

ELECTRIC AND GENERAL INVESTMENT CO. (LTD.)—According to the annual return to July 10, the capital is £200,000 in 39,900 ordinary and 100 founders' shares of £5 each, of which 20,000 ordinary and all the founders' have been taken up. £1 has been called up on each ordinary and £5 on each of the founders' shares.

UNITED RIVER PLATE TELEPHONE CO. (LTD.)—The annual return to July 17 has been filed. The capital is £500,000 in 40,000 preference and 60,000 ordinary shares of £5 each, of which 40,000 preference and 58,000 ordinary have been taken up. £5 per share has been called up on 16,639 preference and 42,000 ordinary, and £2 on 23,361 preference shares.

WEST AFRICAN TELEGRAPH CO. (LTD.)—The annual return to July 3 gives the capital as £400,000, in 40,000 shares of £10 each, 23,109 of which have been taken up. £10 has been called up and paid on each share.

CITY NOTES.

MEMORANDA.—Bank rate 4 per cent. (since July 19, 1900). Price of silver 28 1/8d. per oz. (Aug. 16). Consols (2¾ per cent.) 98 1/16—98 3/8 for money, 98 7/8—99 for account; 2½ per cent. 97½—98 (Aug. 16). Stocks and Shares Continuation Days, Aug. 28 and Sep. 12; Ticket Days, Aug. 29 and Sep. 13; Pay Days, Aug. 30 and Sep. 14; Mining Share Carry-over Days, Aug. 27 and Sep. 11.

BLACKPOOL AND FLEETWOOD TRAMROAD CO.—The report for half-year ended June 30, states that, including last half-year's balance the profit, after paying debenture interest, is £4,265. 5s. 11d., and the directors recommend a dividend at the rate of 4 per cent. per annum, absorbing £3,000, writing off £100. 19s. 1d. from Parliamentary expenses £169. 7s. 6d. from preliminary expenses, and £500 for depreciation, leaving £494. 19s. 4d. to be carried forward. The number of passengers carried during the half-year was 660,006, and the gross receipts were £10,125. 17s. 2d.

CAVE HILL AND WHITEWELL TRAMWAY CO. (LTD.)—An extraordinary meeting was held at Belfast last week, when the proposal of the British Electric Traction Co. for the conversion of the line to electric traction was approved.

FRISWELL'S AUTOMOBILE PALACE (LTD.)—During the week this company, which has a share capital of £40,000, has invited subscriptions for capital.

LEAMINGTON AND WARWICK TRAMWAYS CO. (LTD.).—The report of the directors for the year ended June 30 states that a provisional order for the working of the tramway by electric traction in Warwick has been obtained, and negotiations are pending with the Corporation of Leamington with a view to acquire a similar order for that borough. When the requisite powers had been obtained the arrangements for converting the line into an electric tramway would involve the winding-up of the existing company.

STOCK EXCHANGE NOTICE.—The Stock Exchange committee has been asked to allow the further issue of 1,600 £10 fully-paid 5 per cent. non-cumulative preference shares (Nos. 37,001 to 38,600) of the *British Columbia Electric Railway Co. (Ltd.)* to be quoted in the official list.
